AIM
ST Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the June '91 disk. For more complete docs, see the text files contained in most of these archives.

BUSYBUD.APP—On line? Nature calls? You can't take a break because the BBS will TIMEOUT and HANGUP before you can get back from the canman? BUSY BUDDY to the RESCUE! From Mat*Rat.

CAL51.APP—New features like automatic HotWire alarms and DC-Squish compatibility! See calendar of any month/year. Attach events to days by date or position in month—never forget a birthday again! New CalShow runs as AUTO program *or* GEM program or desk ACC! Preloaded with over 100 events! Runs on any ST/TT, any rez.

DCBOOTIT.APP—DC Boot It lets you run boot disks from the desktop. Choose drive A or B, 50 or 60 Hertz and resolution. A needed addition for accelerated computer owners. From Double Click Software. 100% Assembly. ST, STe, and TT compatible.

DCINVERT.APP—DC Invert from Double Click will flash your screen whenever a BELL character is printed to the screen. You can set the flash rate. Program suggested by Alan S. Hamilton.

DCLFTARW.APP—DC Lefty Arrow is a supplement to Double Click's DC Lefty program. DC Lefty Arrow makes your normal arrow (which points left) 'flip' around so you get a 'left- handed' mouse arrow! ST and TT compatible.

DCPOPBAR.APP—DC PopBar v1.0 gives the GEM desktop a 'popup' menu of the menubar entries. Now all entries are available in a popup menu wherever the mouse is. Built-in configurator. ST resolutions only. TOS versions below 2.0. 100% Assembly. ST & STe compatible. From Double Click.

DCRTCALL.APP—DC Right Call v1.0 gives you access to the file selector (including alternate ones like UIS) or Maxifile(tm) with the press of the right mouse button. Desk accessory from Double Click Software. 100% Assembly. ST,STe,and TT compatible.

FNKALERT.APP—A really *tiny* (but powerful!) program that lets you use the function keys F1, F2 and F3 to select the buttons in any GEM alert box! Highly compatible with all ST/TT GEM programs, Funk Alert uses less than 1K of memory! Copyright 1991 Charles F. Johnson & LGF Software.

FORMDOIT.APP— FormDoIt 1.2 alters the way dialog boxes and alerts behave in most programs. It lets you:
- o Use the keyboard to select buttons in dialogs and alerts
- o Position the edit cursor anywhere in a field with the mouse
- o Use Shift-left-arrow to move to the start of an editable field
- o Enter any ASCII character, from a table or by number
- o Re-define the icons used in alert boxes

And much, much more! Works with CodeKeys, MaxiFile, and all versions of UIS.

HP2GDOS.APP—Converts fonts in HP LaserJet format into GDOS format. There are many more fonts available in laserjet format than in GDOS format. Now you can take advantage of them and convert them for use with any GDOS program.

LZH11316.APP—New LZH archiving program. Faster compressing than any of the current programs.

NOVAGAME.APP—A great version of the arcade classic, Galaxian, with outstanding graphics. It comes from Europe and runs in low-resolution only.

SERIAL.APP—Fixes some problems with the serial port in TT TOS (up to 3.05) and Mega STe TOS (up to 2.05). Written by Allan Pratt of Atari.

SQUEEZIM.APP—Squeeze that last bit of disk space out of your IMG files. Does a whole folder at a time and squeezes an extra 2% to 70% out of each IMG file found! Does not hurt the IMG and it still loads into any program just like before, it's just smaller. From the guys at Wiz Works.

STRABBLE.APP—Excellent shareware version of Scrabble for the ST called STrabble. Written by Warwick Allison from Australia, it has a 45,000 word editable dictionary. It allows for up to 6 human or computer players, or a combination of both. Both color (medium resolution) and monochrome are supported. *Requires 1 Megabyte of RAM.*

TELEBASE.APP—TELEBASE Version 1.4 keeps track of all those phone numbers! 56 buttons per TBF file instead of 25. 15-character memory tickler buttons. Double the room for notes on each button! New SEARCH and PAGE features! Printing function completely revamped! Copyrighted but Freeware. Great addition to utility collection!

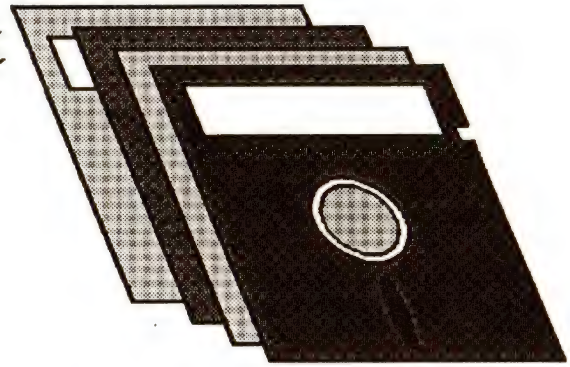
VCTRDEMO.APP—Vector Balls from the Lost Boy's Red Sector Demo. This is an impressive demo! Color only.

VIDI2DLT.APP—Converts sequentially-numbered Degas .PI1 files to a delta (.DLT) file. It will convert an animated sequence created with Vidi-ST, Rezrender, or any other program that produces similar files. Runs in any resolution, but converts low-res files only.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the June '91 disk when ordering.

AIM 8-Bit Disk of the Month

June 1991



Each AIM 8-bit Disk of the Month is a single-sided, single-density "flippy" packed with ARCed software. To extract these files, you will need the UNARC.COM utility (available from most BBSes, user groups or on the April/May '91 AIM 8-bit disk).

Here's a short description of the files on the June '91 disk. For more complete documentation, see the text files contained in most of these archives.

Side 1 of the June '91 AIM 8-bit Disk of the Month:

APACVW2.ARC—Version 2.3 of APACVIEW adds the capability to create COLRVIEW, Pryzm and Interlaced APAC files from GIF source pictures. If you've envied the IBMer's or STer's ability to view colorful GIF pictures, now you can view 'em too! Shareware, by Jeff Potter.

APACPICS.ARC—Sample APAC pictures showing off some of the great color capabilities of Jeff Potter's APAC View program.

DD2NX103.ARC—Daisy Dot II fonts converted to NLQ (near letter quality) RAM fonts for downloading to Star NX10 printers.

DD3MAC.ARC—John McGowan's Textpro 4.54 macros for using Textpro and Daisy Dot III.

Side 2 of the June '91 AIM 8-bit Disk of the Month:

COLRVIEW.ARC— Version 2.5 of COLRVIEW, the program that gives Atari 8-bit users the ability to display images with 4096 colors in 80 x 192 resolution or (new feature) 64 colors in 160 x 192 res. That's right...4096 colors with no hardware modifications! This version also has easy to use color tuning (without adjusting your monitor) and a few other features. Shareware from Jeff Potter!

GR8TODD3.ARC—Converts Graphics 8 screens to Daisy Dot III format. Now, you can use all those Graphics 8 screens as clip art in your DDIII documents.

HPDRIVRS.ARC—Three printer drivers for the HP DeskJet—two for AtariWriter and one for PaperClip. The Times font driver requires an ASCII Times cartridge and includes the AW2DISK option (allows you to (P)rint to disk from the menu with [OPTION] P). The Times driver has corrected character widths for reasonably good Justified output. Works on DeskJet Plus and DeskJet 500. Not tested on DeskJet. From Bob Woolley.

RAMBOOT2.ARC—RAMdisk booter, allows you to run autoboot games from RAMdisk! Multi-disk games supported. This utility was mentioned/reviewed in the November '90 issue of Atari Interface. Works with NEWELL upgrades. See BOOT2FIX.

BOOT2FIX.ARC—Patch program to make RAMBOOT2 work with RAMBO and compatible upgrades.

PSIRD203.ARC—Alternative RAMdisk for SpartaDOS users. This RAMdisk, from PSI, reportedly avoids/fixes some problems that ICD's own RD.COM program has. For SpartaDOS users only.

PSTODD3.ARC—Useful little utility to convert PrintShop icons to Daisy Dot III format! Program by John McGowan.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the June '91 8-bit disk when ordering.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, from 6:30 to 9:30 PM. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Library of about 700 disk titles. Each month we publish (FR)ANTIC covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

Presidential Ponderings

Interests are continuing to expand to educational goals and are providing more of a community service. In my view, this trend is healthy and good. About a year ago, the San Antonio Computer Society (SACS), which espouses this philosophy, was formed in San Antonio. Their stated goal is to provide the community with computer information without regard to the computer system.

SACS members have formed various Special Interest Groups (SIGS) for various computers and interests, including the Atari. They also pubish a very attractive and professionally done monthly magazine for their membership. It is not the purpose of SACS to replace or absorb existing user groups, rather to provide a central point for the consolidation of information and coordination of programs. For further information, contact SACS at P.O. Box 18365, San Antonio, TX 78218-0365, tel (512) 654-6897.

I have included this information in my "Ponderings" this month in the hope that user groups in other areas may consider the benefits of expanding their purpose to a more educational and community-oriented concept. As a nation, we are not doing all that well in the educational scene. We all can provide a significant positive influence in our communities, if we choose to do so. LET'S DO IT!

AUSTIN ATARI COMPUTER ENTHUSIASTS AACE

Our new slate of Officers has generated some new activity in the Club. We have a new MIDI SIG that is six months old, and have just started our second C class. This one is different, part tutorial, part hands on. The only problems were installing the new compiler for the 8 bit users and getting the Mark Johnson C in the ST library to work at all(we didn't have anyone who spoke fluent UNIX). All in all this class was more fun than the last one.

We are still looking for a semi permanant meeting room. All of the options turned into duds because of location, size, parking, and most importantly-liability insurance(it's a killer). But we'll meet the first Wednesday since it's time for a change. Our current meeting is a combined Disk Party, General Meeting, and Officers meeting, but it gets kind of cramped both in space and time.

Both our ST and 8 Bit libraries have been revamped, with more changes coming. They will be easier to access, and have more data per disk at the same price-the ST will be double sided and the 8 Bit will be flippy(SD). 8 Bit lists are available, with new disk update lists printed as needed. Early summer should see the 8 Bit library finished with more new lists printed. Also in early summer will be the AUSTIN COMPUTER FAIR. We have attended that in the past and may this year provided we can get a lot more volunteers and more organised than last.

AACE ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

President	Richard M. Houser	(505) 299-3977
16bit Vice President	Everett Schnetzer	
8bit Vice President	Ed Skeans	
Secretary/Treasurer	Mike Evans	

General membership AACE members meet twice monthly, on the first Saturday and third Tuesday of each month. An 8bit meeting is held on the second Tuesday of each month. On the first Saturday of June and December, a Swap Meet is held. Dues are $20 a year payable in January. Members receive an AIM subscription, access to our 16bit and 8bit PD library and membership in the ASTRO BBS (505) 260-0448 Club membership is at an all-time high of 36.

The Atari Clubs of Denver is an umbrella group consisting of: Atari Club of Denver, Starfleet User Group and the ST Interest Group. Atari Club of Denver meets the first Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7:00 PM. Starfleet User Group meets the second Friday of each month. We meet at Pamona High School 8101 West Pamona Drive in Arvada, Colorado. The meeting starts at 7:00 PM.

Atari Club and Starfleet provide support for Atari 8-bit owners.

ST Interest Group meets the third Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7PM. The ST Interest Group provides support for the entire ST computer line.

Our address is: Atari Clubs of Denver POBox 24064 Denver, CO 80224. For additional information call our BBS at (303) 343-2956, 24 hours, 300-2400 BPS.

Atari Club Minutes - April 2, 1991

We had a pretty good turnout for the April meeting. I saw 3 members who haven't attended for some time.

Steve started the meeting off by showing two BASIC programs that he wrote. The first program allows up to 18 different fonts to be displayed at once on the screen. This makes it easy to discover duplicates or compare fonts. The second program, an icon indexer, reads the names of icons from PS icon disks and then writes them along with their disk number to an ASCII file. The ASCII file can then be sorted and printed. This makes it easy to find icons with out having to look through each disk every time.

Mike showed four programs to change the default settings for AtariWriter+. The global settings, buzzer switch and duration, screen colors, and character brightness can all be changed and saved to the AtariWriter+ OBJ file. This program works with the original files with out affecting the copy protection.

Larry finished by demonstrated the latest enhancements to the File Information Program.

Starfleet Minutes - April 12,1991

Chris surprised all of us by announcing that he has cataloged all of the disks in the game section of the library. We had hoped that some of the members would volunteer to help out with this project when it gets rolling. Now we don't have as much to do thanks to what Chris has accomplished.

Mike again demoed the programs to change the default settings in AtariWriter+.

We closed the meeting by trying out some of the enhancements to the File Information Program by using it to look at what Chris had done with the game disks in the library.

ACCEPT

Atari Computer Club of El Paso, Texas

ACCEPT (Atari Computer Club of El Paso Texas) ACCEPT is the only Atari club in the entire El Paso southwest. Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT 10953 Yogi Berra El Paso, Texas 79934

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCEPT executive committee Steve Bruck, Tim Holt, L.R.'Pete' Rosh, Dave Davis

May 11, 1991 Here's what happened if you missed it:

1. New Logo for the club shown to members. Will be sent to AIM next week.

2. The information about the free offer was discussed. 12 people have responded to the offer, and one has even joined the club for the full year.

3. 5 members brought computers to the meeting: Paul, Steve, Tim, James and Mr. Regan. Thanks to all.

4. The AIM issue has been sent out to all members last Monday. Should be in your mail this week.

5. Members contributed enough for us to purchase the update to Express. Thanks to all who chipped in.

5. Paul brought a potential new member to the meeting, thanks Paul.

6. Paul showed off the Mac, Steve showed off the formatter, James demoed Vanterm to a needy user.

7. The club auction will be the July meeting.

8. There will be no elections of officers this year. You are stuck with me for another year.

9. James will create a reminder memo that will be mailed out to all late members.

10. Welcome Robert Faulkner to the club. Robert comes from Colorado Springs, Colorado.

11. David Thurman did not renew for the next year, and has been deleted from the club membership.

See you all at the June meeting. Make plans to attend. Until next month...

Tim

ACCT

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher cost.

ACCT meets on the second Monday of the month, from 7-9 pm at Bassett's Health Foods, 3301 W. Central Ave (Westgate Shopping Center), Toledo, OH. ST Sig held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. ACCT may be contacted at 4487 289th, Toledo, OH 42611 or by calling Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

ACCESS -- The Atari Computer Club Encompassing Suburban Sacramento. As usual, please call any officer if you need information, directions or even to make a suggestion. Or, you can call the ACCESS BBS at (916) 428-8662.

For those of you who don't know who we are, ACCESS is the Atari 8-bit user group for the Sacramento, CA area. We provide help and information to the local Atari community. We offer a number of meetings each month to give you more information on your computer and to answer your questions. And, of course, we are anxious for you to share what YOU know, since there always seems to be something new and fascinating in the Atari world.

Our general meeting is at 7:30 PM on the first Wednesday of each month in Classroom B of the SMUD training building at 1708 59th St, between Folsom Blvd and R Street, just off Highway 50. This is our main get-together.

Other monthly meetings are held on the following three consecutive Tuesday nights at the homes of Barry Gordon (Modem SIG), Bob Drews (Board of Directors Meeting), and Tim Naber (Disk SIG). Telephone them for additional details, but we hope you can be a part of these groups.

We appreciate becoming part of the Atari Interface Magazine group and hope to be in touch with you other 8-bit user groups. We'll be seeing you....

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, based in room 262S. Before each meeting, a STarter class for the ST meets at 6:45 pm and a Basically Speaking class for the 8-bit starts at 7:00 pm.

ACORN operates a BBS at (716)436-3078 with 52 megs of public domain downloads for the 8-bit and ST systems. Our mailing address is POB 23676, Rochester, NY 14692. Dues are $18 per year which includes access to the club's PD libraries, enhanced access to our BBS, and subscriptions to our newsletter, the ACORN Kernel and to Atari Interface Magazine.

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

CALENDAR: Tentative schedule for the demonstrations at the monthly meetings are:

June, Telecommunications; July, Three Rivers Festival

April Meeting Notes

The agreement with the IEEE was discussed and signed by both parties after giving the members one last chance to voice objections at the meeting. There were none so Eric Converse signed the agreement for ACORN. The BBS's 180 Meg hard drive is back on line after being repaired. We should be up and running on Fidonet before long. The Three Rivers Festival will be in July and we will be needing some help with our event as usual with equipment, individuals to help demonstrate software, and MIDI Masters for MIDI Maze. Don't forget, "The Magic of MIDI Music and Much More!" at Saint Francis College, Fort Wayne, Indiana, July 13, noon to 6 PM.

Atari shows in Windsor/Detroit, Milwaukee, and Indianapolis are scheduled for May and June. Several members are planning on attending these. Check with the officers if you would like more info.

The official topic for the demonstrations was Programming Languages. Scott Schaffer covered some of the fundamentals of 8-bit Atari BASIC using a 130XE. Ken Helms demonstrated STOS on the ST with program he wrote for his son's Cub Scout pack to help with their Pinewood Derby. Other languages were also discussed during the meeting. Ken was using an IBM compatible keyboard with his ST using a D.E.K.A. adapter purchased from WuzTEK. Mike Surface demonstrated Universal Military Simulator II. A copy of Road Race for the 8-bit Atari computers was given away as a door prize.

May Meeting Notes

The May meeting was kept informal with the Windsor AtariFest a primary topic for the day. Ten A.C.O.R.N. members attended the show and brought several items back to discuss. The show itself was enjoyable and gave many of us our first look at the new TT and Mega STe computers as well as other products like those from Gadgets by Small, ICD, CodeHead, and others. Copies of the new AtariUser magazine were given out at the meeting.

Don't forget, The Magic of MIDI Music and Much More!, Saint Francis College, July 13, noon to 6 PM. Sponsored by A.C.O.R.N. An official Three Rivers Festival event. Come join in the fun. Free!

ACUNET

Atari Computer Users Network

Salem, Oregon

ACUNet is the Atari Computer Users Network in Salem, Oregon. The key word in our name is "network." We are here for anyone who has an interest in actively networking with others interested in Atari computers. (It only works as well as we all make it work together, folks!) The #1 benefit of membership in ACUNet is tapping into the knowledge and talents of one another -- at our monthly meetings, via BBS, in our newsletter, one-on-one.

Annual dues are $15 with an AIM subscription and $10 without. Our meetings are held the fourth Tuesday of the month at 7:00 p.m. Call Ron Purdy, ST Co-Chair at (503) 588-7509 for the current meeting location and other information.

Local BBS support includes the Atari SIG on the Salem Public Library BBS - (503) 588-6130, Page BBS - (503) 363-0171, and The Jungle BBS - (503) 393-4274. Want more information about ACUNet? Write to Ron Purdy, 2662 East Nob Hill Drive SE, Salem, OR 97302.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, California on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

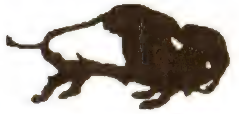
BRAG ST



Buffalo Region Atari Group for ST's

BRAG ST was founded in 1987 to serve Atari ST owners in the Western New York area. General Membership Meetings are held on the third Thursday of the month at Erie Community College North Campus, Room S-105 in the Student Center. Setup begins at 7:00 PM; Meeting starts 7:30 PM. The Board of Directors meet on the the first Tuesday of the month at the Your Host Restaurant, Harlem at Sheridan at 7:30 PM. All are welcome to attend. Piracy will not be tolerated at any BRAG ST function.

BRAG ST, PO Box 1035, Buffalo, New York, 14225

Chairman	Mark Pierro	(716) 691-7844
Vice Chairman	Ken Malark	(716) 683-1272
Finances	Gerry Genson	(716) 877-1328
Records	Joe Rogozinski	(716) 877-8378
Disk Librarian	Carl Barron	(716) 885-4325
Public Relations	Harvel Hontz	(716) 689-8074
Graphics	Dick Kersting	(716) 839-0494

The March 21, 1991 meeting was opened at 7:45 PM by Chairman Mark Pierro. This was the night of our annual auction, and everyone there seem to have a good time and find a bargain or two. We also had two new members sign onto the BRAG*ST membership log. By the time the meeting closed around 10 PM, about $106 had been generated for our treasury. Thanks to all who attended and made it a successful evening.

April 21, 1991 Meeting The meeting was opened by Chairman Mark Pierro at 7:30 pm, there were 14 members present.

Announcements: Mark said he was contacted by an Atari user in Norway who was interested in trading public domain disks with our group, Mark said he would follow this up and we will see what happens.

The AIM disk of the month did not show up in time for this month's meeting. Carl Barron had made a substitute disk for this month and the AIM disk will be available next month.

The Back Scatter BBS will have telephone number as of May 1st, the new number is (716) 646-1114. Mark the did a quick review of the areas we use and how to maneuver through this areas.

Demonstrations: Mike Burkley demo'd his Acer multi-sync monitor which can handle all three resolution and his SyQuest 44 megabyte removable hard drive.

Burt Royce then was to demo Archipelagos but the program would not run on Mike Burkley's computer.

During the break, Archipelagos was raffled off and won by Mike Burkley.

Joe Rogozinski then demo'd TX2VIEWER a text editor that can import graphics and is used to view GEnie Lamp an on line magazine on the GEnie BBS.

The meeting closed at 9:45 pm.

COOKEVILLE ATARI COMPUTER ENTHUSIASTS

Cookeville, Tennessee

Cookeville Atari Computer Enthusiasts—c/o Robert Pecora—280 Capshaw Drive—Cookeville, TN 38501—Cookeville A.C.E. meets on the first Saturday of the month at 1:00 p.m. at the Putnam County Library in Cookeville, Tennessee.—Cookeville A.C.E. caters to Atari ST and 8-bit computers and is supported locally by The Generic BBS, Terry Rapp - Sysop.—C.A.C.E.

President	Dan Hale	(615) 526-8002
Secretary	Robert Pecora	(615) 528-7116

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at 127 Pinnacle Rd., Bristol, Ct. 06010

Prospective members may call Rich Scheidel (203)589-3738 or call Gary Jones (203)225-4611, or write, CCCC, 127 Pinnacle Rd., Bristol,Ct. 06010.

Dues are $25 per year,$30 for families. Includes Voting membership, Atari Interface magazine, access to Club library (8-bit and ST) and access to the Club magazine library.

From the Prez

Hmmm...The way I've been keeping up with these deadlines, this'll probably be issued in June. So, keeping that in mind, lets go.

OK, March meeting was held in my SECRET computer room on February 20th at 7:30. Again, Joe Mirando took the lead and brought a bunch of demos of which his contribution to AUA (Atari Users Association) was particularly noteworthy. Joe wrote an excellent article on the achievements of Atari in 1990. (A short article...heh-heh just kidding) The top suits at AUA liked the article so much, Joe has been granted a monthly column. Nice going!

April meeting was held at a different location. YES! Road Trip! Tim Brandt, 8-bit librarian, offered to host the club for the night. Like I said before, meetings will be held at any members house if so desired. I was shocked and amazed when the offer came through, but not so much that I couldn't accept! It was nice to have a different locale for the night. Primarily, we checked out Tim's IBM cased Hard drives that he had linked up to his 4 meg 520. Also of interest was his personal library of scanned art. A lot of it not found anywhere in the Atari world. This is due to his Migraph hand scanner. (Must be nice to have $$)

Business discussed on the April meeting was the development of CCCC's ST library, or rather, lack of development. The main arguement was that between us, we had almost everything the ST Public Domain has to offer. What went ignored for so long was the fact new members had no real one location to access any of these PD programs. SO! Beginning soon, maybe, we will start archiving EVERYTHING that we all have to build up this library. This was promised years ago, and it looks like we will finally do it.

Also, Joe delivered and installed Rainbow 1.4 in this user's Mega 2 in the 15 minutes we had before we took the road trip. About time I had this done, sheesh! Maybe someday I'll even find a nice HD to stuff inside!

May meeting (in 2 more days) will feature Joe Mirando's 4 meg STe! And in all probability, a look inside this new beastie. Joe loves to back screws up and out of things....count on it!

One last item. This is to the 8-bit people....I know you are there even if you're not making any breathing sounds. CCCC has a few 8-bit items for sale. Atari SX212--$25, Commodore 1702 monitor--$150/BO, Olivetti inkjet printer--$100, Epson RX100 wide carriage printer--$150, Epson FX286 wide carriage printer--$150, Epson LX100 printer--$100, P:R Connection--$50, Cables for P:R connection, modem and printer--$10 each.

Some of this stuff is Club owned, some belongs to members. Anyone wishing to respond to these items can call me, Rich at (203) 589-3738, most any SANE time, like I said earlier, I am not working (yet) and will in all probability be around.

Reason for the Club sale is we are no longer into 8-bits. We ALL have them, personally, but we don't use them in the club anymore and no one wants to discuss any 8-bit stuff. Strange..but that's the way it is, April 15th,1991. I'm Rich Scheidel, da Prez....good day.

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held four times a year on a quarterly basis and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, N.Y.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST disks are priced at $2 while the XE library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members as well as members to visit a meeting and share ideas.

ATARI®

The Cuyahoga Valley Atari Computer Club (C.V.A.C.C.), P.O. Box 9173, Akron, OH 44305-0173

The C.V.A.C.C. is a registered Atari user group. The C.V.A.C.C.'s interests include exchanging information and ideas for the help and enlightening of the Atari community. Twice each month club members and their guests are offered either an linteresting demo or workshop on both the 8-bit and the 16-bit systems owned by the club. Dues are $20.00 per year and will entitle members to all club benefits and activities. Each membership includes our monthly newsletter, The Password, as well as a subscription to Atari Interface Magazine. The club also produces a monthly ST Disk Of The Month and has a large ST and 8-bit library. Members also receive a membership card which, when displayed at participating local computer stores, will entitle its bearer to discounted prices.

Meetings are held on the second and fourth Tuesdays of each month at 7:30pm in the basement of the First National Bank in Mogadore, Ohio.

CRAG Calumet Region Atari Group

CRAG—Calumet Region Atari Group, PO Box 10995 Merrillville, IN 46411, is a club for users of the Atari ST, STE, and Mega ST computers. CRAG meets on the second Wednesday of every month at Broadway Music, which is located in Greentree Plaza, at 1509 W 81st (US 30), Merrillville, IN. Meetings begin at 7PM.

Membership in GRAG is open to anyone. Dues are $15 a year and entitle you to a subscription to Atari Interface magazine, as well as discounted prices on CRAG's Public Domain/Shareware library disks. Library disks are double sided. Cost per dis is $2.50 for members, $4 for non-members. For more information call:

Jeff Coe (219) 663-5117
Randy Noak (219) 663-6912

President's Ramblings

From April 8th through the 11th was the CEPS show in Chicago. For the life of me, I can't remember what CEPS stands for... but I know that the show was for the print industry, which includes Desktop Publishing. [Ed: CEPS = Corporate Electronic Publishing Show]

This was Atari Computer's first time as an exhibitor, which seems very odd seeing as how DTP is probably Atari's strongest niche market next to MIDI. Bill Rehbok, formerly our favorite Atari fixer at Multi-Comp in Chicago, and now Atari's number one Tech Representative for developers, was instrumental in pulling off an extremely strong showing for our favorite computers.

He also invited Randy Noak to spend the week demoing software at the event. Most of you already know this, since Randy gave us a report at the April CRAG meeting, but you might not know that Randy was allowed to bring some goodies home with him after it was all over. I don't want to spoil the surprise, but you can look for a very neat demonstration at an upcoming meeting. I think Randy's writing an article about the show as well that we can look for.

One interesting aside here. Atari's signs and press kits were labeled "Professional Systems Group," and in much smaller type below that was "A Division of Atari Computer Corporation". I guess they've finally figured out that they need to shake the Video Game stigma associated with the name "Atari."

There was also a show on April 14th in Rockford, Illinois. It was the Rockford Hamfest and Computer Fair, sponsored in part by the LCACE, MAAUG, and RACC Atari user's groups. There were several dealers and developers set to appear, including the local ICD guys. I had originally planned on going, but Tax Time put a SEVERE crimp on my cashflow for the month, so I figured it wasn't worth the drive if I couldn't spend any money! I hope the show was a success, but as of today (April 16th) I haven't heard any reports one way or another.

There are also BIG PLANS taking shape for the next Chicago AtariFest. Look for a bigger location, more developers, more seminars, major support from Atari, and unfortunately, a bigger ticket price for admittance. It should be a little closer to home as well.

That's all I have for you today. See you at the meeting!

CUSTUG Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

FRACUS (Fresno Regional Atari Computer User Support)

President	Tom Hancock	(209) 885-2817
Vice President	Phil Kasson	(209) 221-1623
Treasurer	Greg Jennes	(209) 348-0759
Secretary	Dianna Sikes	(209) 251-3252
FRACUS BBS		(209) 251-5338
SysOp	Mike Pound	

The FRACUS user group meets the last Saturday each month, at 6PM, at the Four Seasons Moble Home Park Rec. room in Fresno, CA. We have a large public domain library with over 400 programs. The club also has a 24hour BBS. All 8bit Atari users are welcome to our meetings and to use our BBS (members have an additional sig on the BBS). Dues are currently $20 annually or $5 quarterly which includes a subscription to AIM and issues of our periodically published newsletter. We currently have 16 active members and are continuously growing.

GRASS

GRAND RAPIDS ATARI SYSTEMS SUPPORTERS

GRASS meets the first Wednesday of every month at the Wyoming Public Library, 3350 Michael S.W.. Doors open at 6:30, meeting starts at 7:00pm. Dues are $22.00/yr. including AIM. Bring in one PD software disk and get 2 blank disks for your time.

Charlene Bird	Co-Librarian	(616)795-3593

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

HACE

The Houston Atari Computer Enthusiasts meet on the fourth Wednesday of the month, 6:45pm at the Health Economics Corporation, 2400 West Loop South, in Houston, Texas. The club supports all Atari computers from the 400 to the Mega4.

Membership is $22 per year, and gives full access to our BBS (713) 458-9923, access to our disk, magazine and newsletter libraries, a subscription to AIM, and our local news journal UPDATE ATARI. There are also other benefits, such as store discounts, door prizes, workshops, telephone help when you have problems, and much more! For more information, please contact one of our officers or drop us a line!

JACS

Jersey Atari Computer Society, P.O. Box 710, Clementon, NJ 08021 BBS: (609) 346-1224. The Jersey Atari Computer Society is the oldest and most experienced user group in the South Jersey/Delaware/Philadelphia area, having been formed in 1983.

The regular JACS meeting is usually held on the third Tuesday of each month, at the Camden County Library from 7 to 9 PM. The regular monthly meeting includes topics of interest for users of all Atari 8-bit & 16/32-bit computers. Yearly membership dues (August, 1990 - July, 1991) are $24. As a JACS member, you'll receive a subscription to Between Bytes and AIM, and full access to our 24-hour bulletin board. Copies of the Z*Net newsletter are available for all members at our regular monthly meetings.

JACS public domain disk libraries (for all Atari computers) currently includes over 200 disks, available for $3 (members) or $4 (nonmembers). JACS ST library now includes the AIM DOM. Send a stamped, self-addressed business size envelope to receive a copy of our current disk catalog - please specify 8-bit or ST!

KAUG
Kent Atari User's Group

The Kent Atari Users Group meets on the fourth Tuesday of each month from September thru to May. Meetings are generally held at the North Maple Villiage Mall on #40 Highway just North of Chatham, Ontario.

Our club dues are $20 per year with the opportunity to subscribe to A.I.M. We support both the 8-Bit and ST which gives you access to both an 8-Bit library and an ST library. Disks are $4.00 (Canadian) for the ST and $3.00 for the 8-Bit. Non members, add $1.00 per disk extra.

You can reach us thru the KAUG BBS at (519) 351-3901 anytime, or phone Channel One (519) 351-0760, Monday thru Friday from 10:00am to 9:00pm and Saturdays 10:00am to 6:00pm.

Everyone is Welcome. "Bring a Friend"

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 So. 2275 W., Roy, UT 84067-3515.

Mike Mormando	President	(801)731-1516
Doug Hansen	Vice President	(801)393-6849
Ken Karchner	Secretary/Treasurer	(801)776-8015
Richard Clark	8-Bit Librarian	(801)392-4450
Kelly Knecht	ST Librarian	(801)773-5652
Irwin Brooks	Publications Coor	(801)731-1516

The LACE Club Meets in the basement of the Clearfield Library second Wednesday/ month at 7 p.m.

MID-OHIO ATARI USER GROUP

The Mid-Ohio Atari User Group has its meetings at A & B computers, 1151 Park Avenue West, Mansfield, Ohio, on the third Saturday of each month. Meetings run from 7:00pm until 9:00pm. Demonstrations are welcomed, piracy is not.

The MAUG group is for owners, and potential owners of all models of Atari computers. We subscribe to the Atari Interface Magazine (AIM) as our main source of news. MAUG also maintains a club library for both the Classic (8-bit) and ST computer systems. Both the 8-bit and ST disks of the month from AIM are available at the meetings. There are several past and present members of MAUG which have obtained 'celebrity' status in the Atari world including; Dan Knauf, Tom Hunt, Chuck Steinman, and Mike Brown (now a member of LCACE). We even have one international member from the Netherlands (Holland), Ernest R. Schureurs.

MAUG membership includes access to the MAUG area on the DQS BBS (listed below), access to the club disk libraries, and a subscription to AIM. All this (and more) for the low, low price of $8.50 per year for Ohio residents, and $12.50 per year for others (US only).

More information on MAUG may be obtained by contacting Chuck Steinman on GEnie (DataQue), Compuserve (71777,3223), Delphi (DataQue), or the DataQue Support Board (419-529-5197). The club mailing address is M.A.U.G. c/o DataQue, Post Office Box 134, Ontario, OH 44862, USA.

M.A.C.E.
The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:
MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696.

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 60 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

The April meeting saw a great turnout with some members coming that we have not seen in a while. We had about 20 members with many lively discussions going on. Members seem to have their hopes up that Atari may be ready to do something in the North American market this year.

Top of the discussion was new hardware that Atari has been showing at CEBIT in Germany. Discussions were held on the new ST Pad and ST NoteBook. We had some new members show up at the meeting and saw some faces that we havn't seen for awhile because of the war.

We had the demo's from ST Action - Back to the Future III and Predator 2. We also had demo's of NeoDesk, and a great new program Public Domain program called FormDoIt. FormDoIt which is given out by Gribnif (the makers of NeoDesk) allows you to switch the default box in Alert windows and substitute keyboard commands it also adds an option to use the UNDO button to get out of dialogue boxes. The program goes into your Auto folder and works with all of the programs that I have used so far with no problems.

On the foreign front the ST seems to be doing well. The ST was the best selling computer in Germany this spring and continues to hold a clear lead in France. In Great Britain the Amiga sales have caught up to ST sales and Amiga sales have been good. There are rumors that Atari will be setting up a factory in Israel. This may be a good sign for the American market in that it will help meet the demands of the European market and perhaps make more ST's available in the U.S. There are still ramblings about mass marketing but as of yet there is no news as of what, where or when.

For those of us that use PageStream the upgrade should be available soon for $75. The biggest added feature will be a better screen display with Adobe Fonts and better printouts on a 9 pin printer. Users of version 1.8 of PageStream will not have to worry about losing the use of their fonts because they will still be able to use their old fonts. The upgrade price also includes new manuals for use with the new program.

The May meeting was another success with the usual great turnout. I got to see some faces that I hadn't seen in awhile. Jimmy Howe is off from school for the summer so we should see more of him at the meetings. Also Mike Wadsworth has quit working weekends so that he can concentrate on college so that means that we should see more of him.

We had some free-bees at the meeting to give out. First of all let me announce that the dues will be going up to $6 per year, but there is a silver lining to that. It is the "Atari Users Magazine" that we will now be receiving each month and all the club has to do is pay U.P.S. shipping of $6 per month for 50 copies. We also received our first Atari Coupon book that was loaded with some nice bargains. One that caught my eye was HagTerm for $22 that includes shipping. Be sure to use your coupons so that we can get more.

Bob Blackshear and Jimmy Howe both brought their computers to the meeting so we had plenty of hardware available. New programs that we saw were F29 Retailiator and A.D.S. Advanced Destroyer Simulator.

Another announcement that I would like to make is the date for our ANNUAL COMPUTER SHOW. Once again we will be teaming up with the local IBM users groups of Warner Robins and Perry for our annual show at the Houston County Mall in Warner Robins. The date is OCTOBER 5, so mark it down in your calendar so you won't forget. More details will be forth comming, I'll keep you posted.

Just another reminder that for most members the club dues will be comming up in July and they will be $6. Don't forget to sign up for AIM magazine and keep your subscriptions current. Let me see, that's $18 per year for 2 magazines each month and 2 double sided disks full of software each month. You can't beat that.

That's about it for this month hope to see you on July 14th and don't forget the computer show is comming up.

N.A.U.G.

Nashville Atari User's Group

Nashville Atari Users' Group P.O. Box 121752 Nashville, TN 37212. NAUG meets on the third Thursday of each month from 7PM to 10PM at the Cumberland Museum and Science Center. Membership dues are $24 per family for the entire year. With your membership you will receive our local newsletter, Atari News, a subscription to Atari Interface Magazine, access to the club's 8-bit & ST Public Domain/Shareware libraries, any group discounts on products, and entrance to all club related functions. We have an Associate Membership for $12 per year. With this membership, you will receive Atari News, AIM and access to our 8-bit & ST PD/Shareware libraries. People joining during or after the month of July pay 1/2 the yearly rate. Visitors are welcome to all meetings.

NSAUG

Novia Scotia Atari Computer User Group

The Nova Scotia Atari Computer User Group (NSAUG) is a registered non-profit organization dedicated to sharing information about computing on Atari computers. We will be meeting as one group starting in October (date, place and time to be announced). We own and operate XEST BBS (at 856-0101) which is accessible to all owners of Atari computers. Non-members have limited access to features of the BBS. We are always looking for new members. If you own or are thinking about buying an Atari computer, come on in and see what we do.

We can be contacted either by phone through the executive board or at one of our meetings or by writing NSACUG, 170 Nestor Crescent, Darthmouth, Nova Scotia, B2W 4B1.

President, Treas.	Mike Hundiak	429-2639
ST Vice President	Dave Mason	826-7101
XL/XE Vice President	Hilary McCarron	275-3688
Secretary	Marlene Abriel	434-4430
Newsletter Editor	Steve McCarron	275-368

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.) Call 592-5427, for more info on O-ACEs!

O-Aces - Omaha Atari Computer Enthusiasts 03/13/91

General meeting summary:

At our general meeting in March, we thoroughly discussed what we accomplished at the McMillian Junior High Computer Expo '91. We had 6 machines at the show, including a Mega ST and STacy, thanks to Bob Patton. The club 1040ST died at the expo, the power supply went out. But, the computer has already been fixed. That was fast!

We briefly discussed pirating, and George told us about a group of pirates called the United Federation of Pirates. They ran a bulletin board that he was once on, and it had a very large 'elite' section, that made George delete his account immediately.

We concluded the meeting by talking about the new Mega STe and TT, and talked about their many features. We also talked about Drafix, a CAD program, which was being sold by a former member that showed up at the meeeting (he had acquired a group of them from a local business that was being liquidated). Several members opened up right there and bought a copy. We briefly talked about the upcoming FOCUS meetings, which will include MIDI topics, and ST viruses.

FOCUS MEETINGS for April, May and June:

April FOCUS will be on strategic simulations and war-gaming. Specially featured will be classics like "Balance of Power", newer programs like "Team Yankee", and we expect you to bring your favorites as well.

May: This month the spotlight will be on hard disk utilities. If you have a hard drive or are thinking about getting one, come on out and see what it is all about. We plan to concentrate on those PD/Shareware utilities in our library, though mention will also be made of commercial programs and, as always, we highly encourage you to bring any you have. Bring your questions as well as your observations to share -- remember, FOCUS means never having to say you didn't get a question answered!

June: As summer approaches in earnest, we will return to a subject we have touched on before -- Programming Languages. We plan to primarily review and update what we covered before rather than set off into uncharted waters, so don't worry if the subject is new to you -- come on out and test the waters with the rest of us!

PORTS ATARI

P.A.C.E

COMPUTER ENTHUSIASTS

Membership to PACE is $30 ST and $20 8bit per year or $9 per quarter. Meetings are held at 6:30pm on the third Sunday of every month. Membership includes a monthly newsletter, FREE Disk-of-the-Month, FREE printer ribbon re-inking, and FREE copying priveleges to our VAST collection of 8/16 bit Public Domain programs. Ports A.C.E. is an alliance of families with a mutual interest in the Atari 8/16/32bit Computers. PACE hardware assets: 130XE, 1050 Drive, MacInker and a 520STfm. Any written correspondence should be addressed directly to Ports A.C.E., Tracy Hendershot, 4835 Crosley Avenue, Duluth, MN 55804.

Our March meeting was held in the Board Room of the Duluth Radisson Hotel. This room had luxuries far beyond what we have been accustomed to lately. The glass wall gave us a spectacular view of downtown's firework display. This marked the end of a day-long celebration honoring our Armed Forces and for the early conclusion of the Persian Gulf War.

Our meeting held several surprises for everyone present. Chuck Kelly passed around the internals of his highly modified Indus GT for the 8-bit. Don Pfeiffer showed us his industrial-strength XE mod. His prototype looked as though it was borrowed from the cockpit of a Stealth Fighter! One meg of memory, 3.5" and 5.25" disk drives, built-in 5" monitor, lights and switches for numerous functions, internal cooling fan and detachable IBM keyboard.

The new Mega STe's, TT's, Pen-based ST and the new "notebook" was discussed in some detail. Some members were quite disturbed about the interruption in our AIM/DOM's. It seems AIM has lost record of our check mailed last November. Treasurer John Zupansic found the canceled check and copied it. Hopefully by the May meeting, we'll have our missing Feb/Mar/Apr/May AIM-DOM's for our members. The meeting was topped off with the celebration of PACE's Sixth Anniversary! Nobody brought munchies, so we voted to order pizza for the dozen members present. Compliments of Ports ACE!

Remember, no meetings Jun/Jul/Aug! Each summer, we always find some excuse for the group to have an informal gathering to talk 'tari. Watch the local BBS's for a posting sometime mid-summer. Enjoy the warm summer months, and long live Atari!

The Prez Sez

For some reason, our March column didn't get printed in AIM, so we'll cover the stuff that was missed (which was actually written in January) and the new stuff from the end of March and the beginning of April.

The club is off to a good start with a fair showing at the January 8-bit SIG and a good plan for the ST SIG. By the way, we are still looking for an 8-bit VP. In the meantime, Dave Koster, myself and several others are taking up the slack.

At the January 8-bit SIG we started to review various word processors. We looked at Bank Street Writer, Letter Perfect, AtariWriter and AtariWriter Plus. Each program had at least one redeeming feature. John Sandgren's demo of AtariWriter Plus was a revelation to several of us.

At the March ST SIG, we were privileged to have Cary Calone from Horizon Computers in Denver speak to the club. Cary talked about hardware mods and "disposable" disk drives among other things. The the April ST SIG will examine Bob Vixie's AdSpeed from ICD. Sam Cherry will demonstrate Video Eyes as well. We got 4 disks from our member at the Wyoming State Prison along with a nice letter. Bruce Faulkner and Terry Quinn report that there was some pretty good stuff on them, so will show that at the April meeting as will. The May ST SIG will be a swap meet.

The 8-bitters demonstrated Video Title programs. These programs are used to put titles on home videos. We looked at Video Titler and Video Title Shop. We had a drawing for a copy of Video Title Shop and Roger Meston won (again). We looked at the German Club disk, which was really fascinating. We also demostrated Mario Bros along with Techno Ninja and Cultivation/Chromatics from Software Infinity. The May meeting will be a "game night."

We should be sending out a mailing to seek your interests for future club meetings and to see what kind of problems you are having with your computers.

P3ACE is now an "official" registered Atari User Group. I E-mailed with Bob Brodie over GEnie and the problem was that they had our old address. Lots of good things will happen now, I think.

The club should have a new Bulletin Board home by the time you read this. It is called the "Community BBS." The BBS is run on a 30MHz 386 machine with a Gigabyte of memory and it is hooked to a HST modem that runs 300, 1200, 2400 and 9600 baud. We haven't set it up just yet, but there will be a P3ACE club section on the board. The number is 390-9320.

Please examine your address label to see how your membership is faring. this will also be the first month that we E-mailed the mailing list to AIM, rather than printing them and mailing them. Please let me know if something went awry. We plan to send out "dues reminders" this year as an aid to the forgetful. Remember, in order to get this great magazine, your dues need to be squared away. See you at the next SIG Meeting.

PHAST Club Minutes for Sat. April 13, 1991 - by Jim Keho

The meeting started at 12 noon. There was about 13 in attendance! Where were you?? And where's our President?? He disappeared! But don't worry we have a new President and a Vice Pesident too! It was voted and approved! Thanks to Michael Aubrey (President) and Paul Ihms (V. President) for volunteering!

It looks like there'll be some changes at the meetings in the future! But if you're not there you'll never know! <grin>

Also due to PHAST not being able to afford the central phone line for STBase BBS, PHAST is going to have to stop supporting it.. I hope ST Base will continue though! It's been going a looong time! And it's sad for this to have to happen.. If it does not continue, I'd like to say a big thanks to Ken Riggs for running his OWN system on ST Base and doing a great job! And sorry PHAST couldn't keep supporting it.. Well... Watch for changes with PHAST in the near future.. You have to make it to the meetings though!! So Be There!

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9 to noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

Hey gang! Things are cooking up in the Raleigh area and the club is doing great. All of the officers are keeping very busy and I am up to my arm pits in work and things to do. Therefore, this month will have a very short article.

The most important thing is that you all know when the April meeting will be. The April meeting will be held on April 23 from 7-9 p.m. We will be showing members various ways to SPEED up your ST! From software to hardware, we'll try to cover it all. See ya on the 23rd!

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit Atari computer user group and is not affiliated with Atari Corporation, or any of its affiliates, in any way.

$12 per Year with a one time sign up fee of $13.00.

STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

S.A.G.E.
SPECTRUM ATARI GROUP of ERIE

SAGE, PO Box 10562, Erie, PA 16514-0562

The Spectrum Atari Group of Erie, PA was founded in December of 1984 to provide communication and support among owners of all Atari computers. Our newsletter is the SAGE Scroll which is published monthly. In addition to being distributed to all of our members, the Scroll is exchanged with over 50 other Atari computer user groups nationwide. SAGE maintains extensive libraries of public domain software for both the Atari 8-bit and ST computers.

The SAGE BBS has been operating for 5 years at 814-833-4073 (2400 bps, 24 hours). The SAGE BBS offers public access to all of the message bases, and, in cooperation with the Erie County Library offers a unique on-line reference service known as GET R.A.D. (Get Reference After Dark).

The Spectrum Atari Group of Erie meets on the third Sunday of each month at 2 PM at St. John's Lutheran Church in Erie, PA. We also have SIG meetings monthly covering Telecomputing, the ST/Mega/TT computers and programming in GFA BASIC.

Wizop/Memberships	Steven Kiepe	(619)549-3207
BBS	24hrs, 300-2400 68MB	(619)689-815

It's April as I write this and San Diego just finished its winter/spring transition and some of the heaviest rains in one month in the city's history. No real problems out here in America's greenest desert save the inevitable line noise on the BBS when the phone lines and exchanges get immersed.

By the time you read this, a fair number of our members will have returned from a lecture by Bob Brodie at the H.A.C.K.S. user group in Glendale, Ca. I expect it to be well represented by our San Diego users. We are also starting to look forward to September's Glendale Atari Fest - with Southern California down to only 1 show a year, you tend to start looking forward to it very early!

SDACE will not have it's standard first Thursday ST/8-bit user's workshop in July due to conflict with the July 4th holiday. We will, however, come back in full force when on Thursday, August 1 we hold another Atari Swapmeet at the North Park Adult Center in San Diego. The swapmeet is open only to SDACE members although everyone is invited to attend the 8-bit meeting occurring concurrently with the swap meet. The last swapmeet was so successful that by popular demand, we will be conducting them several times a year.

The SDACE BBS hard drive suffered a final, and very fatal attack of "loss of memory" recently and had to be put to sleep. Actually, through amazing luck, we recovered all files from the old drive and quickly replaced them on a new hard drive. The old one served us well for many years, especially remarkable when you consider that it was an old 40 MB MFM drive pushed to 68 MB by formatting it as if it was an RLL. Its controller was also old and rickety, but we're running solidly once again with a properly driven and formatted drive. Many thanks to Rick Dehaven for a very low cost replacement drive. SDACE salutes you (and the check is in the mail).

We hope you can join us at one of our future meetings!

SPACE

SPACE, the Southcentral Pennsylvania Atari Computer Enthusiasts meet on the third monday of the month at the Camp Hill Mall Community Room. The doors open at 7 and the meeting begins at 7:30. Dues are $15 per year and include a subscription to AIM and SPACE Probes, our official newsletter. SPACE was founded in 1982 and is still going strong. We support both ST and 8bit computers.

For more information, call either John Slade, President at (717) 938-3656 or John Hileman, Newsletter Editor at (717) 938-8753 or write to: SPACE, PO Box 11446, Harrisburg, PA 17108.

SCAT SUBURBAN CHICAGO ATARIANS

AN INDEPENDENT COMPUTER USERS GROUP

SCAT (Suburban chicago Atarians)

SCAT general meetings are held on the third Saturday of each month at 10AM, unless otherwize indicated on the SCAT BBS. The location for the meeting is College of Dupage, Student Resource Center, Lambert Road between Roosevelt and butterfield Roads, Glen Ellyn, IL. SCAT is a not-for-profit computer group for the purpose of helping people better understand and utilize Atari 8 Bit/16 bit/32 bit series of computers for business and pleasure. Meetings are open to all.

Membership dues are $20 per year per family. Membership benefits include subscription to Atari Interface magazine (AIM) and special club events. SCAT and AIM are not affiliated with Atari Corp. in any way.

Anyone wishing to become a member can just come to a meeting and sign up or call SCAT's 24 Hour Bulletin board (708) 231-7227 or write SCAT, P.O. Box 72266, Roselle, IL 60172

STAG
Saginaw / Tri-City Atari User Group
"where the deer and Atarians play"
ST

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9 am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township, Michigan. Upcoming meetings are April 13th, May 11th, and June 15th.

President	Bryant LaFreniere	(517)835-2234
ST Librarian	Jim Fleming	793-9792
Treas/Secretary	Marty Schmidt	792-6029
8 Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's Public Domain library, disks are $3 for a double-sided disk packed full of goodies (2 for $5, what a bargain!). Check your mailing label, if you need to renew, (or haven't joined us yet!). A free PD disk is included with each new membership or renewal! DO IT NOW!

Al could not attend the February meeting to demo Base Two but we had an in-depth review of Superbase Personal by Bryant. Superbase Personal is a low-cost database (~$45, mail-order) that can be used for anything that a person would encounter in their home. The enhanced version (Superbase Professional 3.0) is the ultimate database in terms of cost (~$200) and features for the business or professional user.

Superbase Personal is the most convenient database on the ST market for personal use (according to Bryant). It has VCR-type controls on the bottom of the screen for easy movement through the records in the database. This unique interface makes "looking" at many records very effortless. A special filter function can allow only records that meet the filter criteria to be looked at, printed, and/or exported to another database format. The filter function can be as complex as, for a mailing database, "all zip codes=48640, with last names beginning with A through L, and first name = Al". There are many other features in this database that are usually seen in those $100 database programs. For someone interested in a database that can do more than a mailing list program at a price under $50, this database is for you.

There isn't much to report about the March meeting, since only three people showed up. President Bryant wasn't able to attend, and substitute meeting chairman Marty Schmidt went skiing at the last minute. We therefore have no equipment volunteers yet for the April meeting.

We are trying to buy the latest version of WORDFLAIR II and have a demo ready for the April or May meeting. The program will be raffled off after the demo. As always, only current club members are eligible for the raffle.

At the May 11 meeting there will be an in-depth explanation of how one should construct ASSIGN.SYS files using GDOS and GPLUS+. We'll notify you by postcard of the finalized plans for the meetings.

SST

Sacramento ST User Group

The Sacramento ST users group supports the ST and TT family of computers and meets on the second Wednesday of every month at the Pac Bell auditorium at 2700 Watt Avenue. The meeting starts at 7p.m. with an informal beginners session with the regular meeting starting at about 7:25.

Dues are $24 a year and membership benefits include, the club's newsletter, full access to the club sponsored bbs, a free raffle ticket at every general meeting, membership disk, access to our extensive disk library for a extremely reasonable rate and a subscription to AIM.

President	Mark Warner	(916)344-1150

STUN

The ST Users Network -- supporting users of the Atari ST, Mega, and newer technology computers. P.O. Box 27285 Salt Lake City, Ut. 84118. STUN operates a 24 hour BBS -- (801)272-4243. Open meetings are held on the 3rd Wednesday of each month at 7 P.M. in the Murray High School.

By the time this arrives at your doorstep STUN will have elected new club officers. Thanks to Randy Larsen, Ron Johnson, Garth Walter, Jim Hepworth, and Eric Nikolaisen for taking care of the details that made the club a success this year. Good luck to the new leaders!

ST Atari Road Runners

THE #1 ATARI USER GROUP IN THE NEW HAVEN (CT) AREA

ST Atari RoadRunners (ST.A.R.R.) has held elections and the newly elected officers are as follows:

President - Madelon Wilson - (203) 735-6711
15 John St., Ansonia, CT 06401
Vice President - Leo Taylor - (203) 387-9658
Treasurer - Robert Hueffman - (203) 421-3864
Secretary - Roger Erikson - (203) 481-3326
ST.A.R.R. BBS - (203) 421-4861

If you wish to contact any of the ST.A.R.R. officers, by phone, please keep in mind that we are in the Eastern Time Zone. The ST.A.R.R. BBS is available 24 hours a day and runs on a U.S. Robotics 9600 BAUD modem. All uploads must be public domain. Our SysOp is Bob Hueffman.

Membership in ST.A.R.R. includes a one-year subscription to A.I.M. and access to a large public domain library. Membership dues are $20 per year, and membership is open to all interested users. We meet on the third Thursday of each month (except August) at The Greater New Haven State Technical College, 88 Bassett Road, North Haven, CT. Mailings should be directed to one of the officers listed above.

We will be holding our second annual ST.A.R.R. Picnic in August. Once again it will be held at the Madison Beach Club, and the club will pay for entrance tickets and provide the hot dogs, hamburgers, fixings for same, sodas, and paper goods. Each person or family that attends will be asked to bring either a salad or dessert. Further details, such as the date and time, will be provided to all in plenty of time for you to make plans.

Meetings have been held for the past couple of years at Greater New Haven State Technological College, 88 Bassett Road, North Haven, CT. Due to budget cuts that are effecting many of the state colleges, our meeting schedule has been seriously hampered. The building will not be open on Thursday nights during June and July, so alternate locations are being considered. If you have any questions about this, please contact one of the officers.

We would like to take this opportunity to extend an invitation to all interested parties who might like to join our group. Despite our current scheduling difficulties, we have been in continuous existence since March 1986 and will weather this storm as we have others.

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. There is a free disk of the month for all attendants, please bring your own disk. Dues are $12 per year and includes Atari Interface magazine. Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings.

SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

President	Gary Klugman	(408) 758-4894
Vice-President	Dale Meisenheimer	(408) 449-7750
Secretary/Treasurer	Charles White	(408) 449-8986
BitStream BBS		(408) 449-2150

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

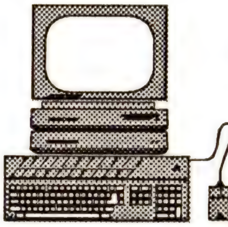
TEAC
The Educator's Atari Club

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

TACE

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649



THUNDER BAY ATARI ST ENTHUSIASTS

TASTE--Thunder Bay Atari ST Enthusiasts was formed in October, 1987 by a core of 5 ST owners interested in forming a user group to help each other and to help in publicising the Atari 16bit machine.

We grew fairly quickly to an all-time hig of 20 members by January, 1990. A monthly newsletter was published, and we established a PD library. Soon after, membership began to decrease -- members were getting to know their machines better, and lack of interest in publising a newsletter. We still have our PD library of about 70 disks, and will be adding to the list as we go along.

Thunder Bay is a city of 113,000 located on the norther shore of Lake Superior. We have one Atari dealer; is his also a dealer for the Amiga and IBM clones. Needless to say, the priority for Atari products is the lowest. We manage to stay alive monthly by mail order purchases -- unfortunate by necessary.

President, Neville Denetto, 185 Varsity Row, Thunder Bay, Ontario, Canada P7B 5P2.

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM, as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WACO also operates the WACO Ward BBS, 300/1200 baud. The club was founded to help Atarians support each other. One of the regular features of each meeting is called "Upload" when members share new information or ask for assistance in solving questions. Both 8bit and ST disks-of-the month are demoed as well as new hardware and software.

Since the first Taricon back in 1984, WACO has been represented at most of the northeastern Atari shows as well as having a booth at all Pittsburgh shows.

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

The April meeting of WAUG was held on 4/9 in the Anderson Room of the Michigan Union. President Craig Harvey called the meeting to order at 7:30pm, announcing this would be the last general meeting before the May 4-5 AtariFest. Craig gave a review to-date of the plans and solicited members to work the WAUG booth. Craig also announced that he and some of the other officers had been interviewed in a 1/2 hour show (for broadcast on Ann Arbor cable channels...) and that he JUST HAPPENED TO HAVE A COPY OF THE TAPE so the next 30 minutes were spent watching it. VOILA! A Star is Born! Many THANX! to member Ralph Salmeron for arranging this free show promo.

Craig announced the upcoming meeting topics: May - Discussion and slide show of the AtariFest including a possible video followed by a discussion of high speed modems; June - Officer elections for '91-'92 followed by the annual Flea Market swap night; July - A suggestion to skip the normal monthly meeting in favor of a pizza party at one of the local restaurants is being entertained by the officers (more info on this at the May meeting.)

Dave B. gave a description of the files on the FIRST 8-bit Disk-of-the-Month from AIM. Bill Rayl has put together a great disk of entertainment and utility software including a relatively new game called Escape from Syntron which Dave demonstrated. Bill is providing a much needed service for 8-bit Atarians around the planet (!) and WAUG is pleased to support/laud his efforts.

Craig described a new magazine that is about to go into circulation. The Atari User Journal, a spin-off from the people who brought you the now defunct ST Journal, will be distributed free every month (WAUG will receive 50 copies...) and subscriptions are available should someone be feeling philanthropic. This must be part of the New World Order we've heard so much about.

Mike Olin gave a demonstration and answered questions about the X- 10 PowerHouse home controller system. This versatile system uses you computer (by way of the RS232 port) to program a master control unit which, in turn, controls various slave devices throughout the home. Using normal electrical wiring, the system sends commands for specific devices to turn on/off at pre-selected times/dates without user intervention. This versatile, hands-off device also serves as a security system by simulating the activities of a normally occupied household while the residents are away and can actually be programmed to conserve energy expenses by operating associated setback controls on home heating/cooling equipment.

Russ Crum gave a Treasurer/Membership report, it looks as if all is stable and steady for the upcoming AtariFest. Russ then sold advance tickets for the show.

The meeting was adjourned at 9:45pm.

WAUG Pizza Party!
The July meeting is a Pizza Party at Uno's instead of the regular meeting.
Please contact Craig (313) 994-5619 to RSVP!
WAUG will provide the pizza, you'll have to pay for your own beverage!
See you there!

Windsor Atari Users' Group

The Windsor Atari Users' Group (W.A.U.G.), founded in 1982, is among the oldest computer clubs in North America to serve the Atari community. We are an international family of Atari owners with members from across Southwestern Ontario and the state of Michigan.

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'. In addition, each membership gives you access to our ever growing public domain library, packed with programming from around the world. Each club disk sells for $4.00 (Canadian) with the occassional monthly special as offered by our club librarians.

President	Brian Cassidy	(519) 966 0305
Vice President	Len Brown	(519) 252 4572
Finance	Gary Choptiany	(519) 966 5489
Membership	Kazmir Choptiany	(519) 254 4557

WNY
U G

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

President	Mike Husband	(716) 825-8486
Vice President	Kevin Packard	773-9325
Treasurer	David Shane	875-5350

The April, 1991 meeting was called to order by the President, Mike Husband, at 7:45 PM at 116 E. Bacon Hall, Buffalo State College campus, with 12 members present.

Mike opened the business portion of the meeting by noting the occasion marked the ninth anniversary of the forming of the Western New York Atari Users' Group. He then extended a note of thanks to several past and current members for their support of our group.

Mike then noted that election of officers will be held at the May meeting. It was announced that our current VP, Kevin Packard, does not wish to run for re-election, so there will be a vacancy in this position. This offers all of our members a golden opportunity to run for one of the top positions in the group.

It was announced that the group has obtained a new Atari 1050 disk drive, at a cost of just $50, to replace our Indus GT drive, which had major problems, including a bad stepper motor and a drive mechanism that was on its last legs. So, we again have a working disk drive for use at the meetings, and we should have no more problems with being unable to run program demonstrations due to drive problems, as has happened on a few past occassions.

The group also gained another new member, who signed on at the meeting and who is no doubt familiar to some of you. John Chmielewski, better known as "Atari," is an electronics technician and is Sysop of the Atari 8-Bit BBS. Welcome aboard, John!

With the business portion of the meeting thus concluded, we proceeded to hold a commemoration party honoring our ninth anniversary. Drawings were held for a door prize and several other prizes. Congratulations to the lucky winners. We hope those of you who won software will demonstrate the programs at an upcoming meeting.

One final note to all members: Because our regular meeting night (1st Thursday of the month) for July happens to fall on Independence Day, we will in all probability be cancelling the July meeting.

NEW! Quick ST 3

Software Screen Accelerator and Desktop Customizer

MAXIMUM SPEED FOR YOUR ST OR TT!

- *Speeds up most ST software by speeding up screen graphics*
- *Text, GEM graphics, and GDOS fonts all redraw significantly faster*
- *Compatible with all ST, STE, and TT computers*
- *Supports all screen resolutions, including Moniterm and ISAC*
- *Fastest version ever! Even the "fast" TT speeds up considerably*

- *Easy to use! Install it in the AUTO folder or run it from the desktop*
- *Requires 20K to 40K of RAM (depends on the configuration)*
- *Includes the Quick Index 3 benchmarking utility*
- *Include the MonSTer high resolution screen emulator*

- *Install any DEGAS Neochrome or Prism Paint picture on the desktop*
- *Change the desktop font and icons with our font and icon editor*
- *Install a different font and picture for every program!*

Accelerate...
Benchmark...
Customize...
...any ST or TT
for only $29.95.
(Before June 31 1991)

Upgrade from:
Quick ST II $15
or Turbo ST $20
(with proof of purchase)

Don't settle for imitations. Only Quick ST 3 speeds up all screen resolutions on all monitors.

Branch Always Software

Quick ST 3 will be available at Atari ST dealers across the U.S. and Canada in July 1991 at a price of $34.95 U.S.

Write for our free newsletter!

Order Quick ST 3 before June 31 at an introductory price of only $29.95 U.S. Product shipment starts June 17, 1991.

Ad*Speed*™ ST

ICD reaffirms its position as the leading developer of third party hardware for the Atari® ST with the introduction of **Ad*Speed* ST**, a full featured low–cost 16 megahertz 68000 accelerator for all Atari ST, Mega, and Stacy computers. With **Ad*Speed* ST** almost every operation of your computer will be performed faster.

Ad*Speed* ST continues ICD's tradition of providing the best product available. These are some of the features that set it apart from the competition:

- Works with all ST models, from the 520 ST to the Mega 4 and Stacy.
- No mouse, I/O, or blitter conflicts.
- No jumper wires.
- Low power, high speed CMOS 68000 CPU for full 100% instruction set compatibility.
- Software selectable speeds, with a true 8 MHz mode for 100% compatibility. Switches speeds on the fly without rebooting the computer!
- 32 kilobytes of high speed static RAM for 16K of data/instruction cache and 16K of cache tag memory.
- Full read and write–through caching for maximum speed.
- State of the art multilayer, surface mount design makes **Ad*Speed* ST** the smallest accelerator available anywhere.
- ICD's famous quality, dependability, and support.

Ad*Speed* ST is the most effective way to increase the overall speed of your Atari computer. You'll be amazed at the increase in your computer's performance and your productivity.

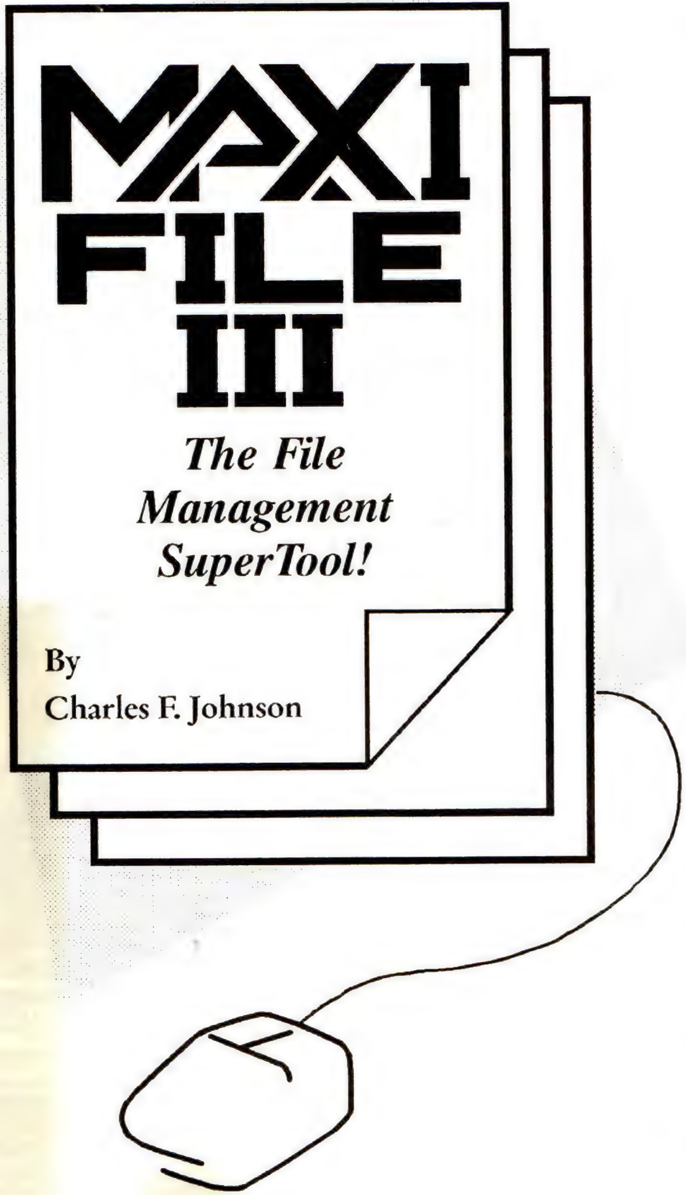
Nothing compares to MaxiFile III!



That's right – there's just no competition! **MaxiFile III** is far and away the most advanced file/disk management utility for the Atari ST and TT; nothing else even comes close!

MaxiFile III runs either as a GEM desk accessory or as a GEM program, so it's always available when you need it. You'll never have to exit a program just to copy, erase, move, or rename files or folders, or to format or duplicate a disk.

Our unique **Graphic Disk Info** display shows you the percentages of used and free space on all your disk drives, both numerically and with a bar chart.

Special **batch operations** let you rename groups of files, change date stamps, change file attributes, "fastload bits" and TT RAM flags, and even queue up a list of files to print – with just a few mouse clicks or keypresses!

If you've ever misplaced a file, you'll appreciate MaxiFile's powerful **search** function, which lets you search for multiple types of files by time/date, attributes, and more!

MUG SHOT!

$39.95

Parts is parts, they say, but with MUG SHOT! parts add up to a whole lot of fun and practicality. Extra data disks are available for only $19.95 so you'll *never* say, "Gee, is that all there is?". The possibilities are truly endless.

- Save as IMG, Degas or .MUG file.
- Prints in 4 sizes to Epson 9/24 pin, HPDJ, HPLJ, SLM804, KXP4450, and more.
- Works in color and monochrome from minimum 512K to TT RAM!
- Optimized for use with big screen monitors.
- Comes with a set of famous faces and a cartoon set for kids of all ages!

Addtional Data Disks: Mr. Veggie-head, StereoTypes of the 90's, Real People

Loadable data files means infinite possibilities!

IMAGE CAT

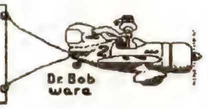
$24.95

The complete **Graphics Cataloguer**! Can't find the right picture? Look in *your* catalogue of *your* art and find just the right pic for your needs in seconds!

- Fully automatic, fully loaded. Prints up to 15 pics per page!
- Automatically prints up to 28,700 files with ONE click of the mouse!
- Catalogues *your* IMG, PI#,PC#,NEO,TN# and MAC files without hassles
- Does not require GDOS
- Prints to Espon 9/24 pin, HPDJ, SLM, HPLJ, NEC, KX-P4450&20
- Catalogues color pics with your choice of dithering for best print quality!

Get IMAGE CAT and get the picture!

MVG



$59.95

Dr. Bob's Handy Dandy **M**ulti**V**iewer **G**raphica: *ALL NEW* MVG ***version 2.0***
Do more than just touch up your graphics. And do it 16 times faster! Cut your editing time in half then in half again! Written in 100% optimized machine code!

- Now compatible with big screen monitors!
- Loads & saves IMG, PI3,PC3,NEO, MAC- plus saves in TRUE-MAC format!
- Built in fonts or import GDOS fonts *without* using GDOS
- Best Cut-n-Paste *ever* for the ST!
- Image size limited only by available memory.
- Modules available for the Geniscan/ST™ and the Migraph™ hand scanners. (G:$14.95/M:$19.95)

Do it *better, faster* and *easier* with MVG!

ATARI INTERFACE

Your Connection to the Atari Users Community

Publishers
Bill Rayl / Patricia Snyder-Rayl

Managing Editor — Patricia Snyder-Rayl
Editor — Bill Rayl
Contributing Editors — Dave Plotkin, Paul Alhart, Tim Holt, Paul Stampfli

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs is preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

EDITORIAL RAMBLINGS

THIS ISSUE OF Atari Interface focuses on products from CodeHead Software. Charles F. Johnson and John Eidsvoog of CodeHead have brought the Atari community some of the very best utilities and enhancement programs available for any computer system.

If you own any Atari from an ST to the new TT, chances are you are using one or more of the programs written by these two guys. If you aren't, you should! In this issue, we review MaxiFile III, Hotwire 3.0, CodeKeys, and LookIt! & PopIt!

Just before press time, we received some good news and some bad news from the CodeHeads.

First, the good news. The new two-disk update to the CodeHead Utilities package arrived. We're impressed with the innovative additions they've made to this package. Their RAMdisk and Print Spooler combo is truly amazing. CodeHead Utilities is something every Atari ST/TT owner should not be without.

Now, the bad news. The ever-slowing, ever-declining US market for Atari is taking its toll on everyone, including the CodeHeads. The CodeHeads have now become registered Macintosh developers. While the CodeHeads will continue to support their current products in the Atari market, they "currently have no plans to release any new products for the Atari market."

The CodeHeads have been a mainstay of the Atari market almost from the ST's beginning. Losing their continued innovativeness would be a serious blow to the Atari community.

What can you do to keep them producing new software for the ST and TT? Buy their current products! If you already own the packages, get them upgraded to the new versions (the enhancements are well worth the upgrade costs). If you're using a CodeHead product that you haven't paid for, replace it with a legitimately purchased copy. Like the commercials say, "Just Do It!"

Bill & Pattie Rayl

From The Reader's Viewpoint

Editors:

In the April/May issue, Wayne Padgett from SVACE outlines some problems he is having using the current version of WordUp, 3.0. His main complaint appears to be his inability to import ASCII files using TOS 1.2 or 1.4. I had this same problem, namely that each attempt to do so would produce two bombs.

There is a solution. The key is you must turn off text mode prior to attempting the import. While I realize that having to turn _off_ text mode to import ASCII text files seems rather oxymoronic, it makes a certain amount of sense when you consider WordUp's development history.

This document processor was written to use GDOS thereby giving the user access to fonts not resident in his or her printer. Text mode was just added in version 3.0 and apparently the authors made no provision for ASCII import in that code segment.

They also made no mention of this information in the rather mediocre manual either.

Wayne also mentions that use of the thesaurus with TOS 1.4 causes a crash on his system. I also have TOS 1.4 installed in my Mega 4 and have never had a crash using the thesaurus.

It is possible that Wayne has some accessory or TSR/AUTO folder program installed that is causing a conflict. Other than that I can't think of any explanation for his problem and my lack of one.

I agree with Wayne that any future support for this program seems rather unlikely unless Atari adopts WordUp as an in-house program. This is a possibility since Mike Fulton is currently employed by them.

However even if this happens, I don't know how much further development we can expect to see.

By the way, I typed this letter in Flash's editor, saved it as an ASCII file, and then imported that into WordUp to use it's spell checker. No bombs at all.

I did that just as a test, since the AIM editors can attest to the fact that I really don't _need_ to use a spell checker. <grin>

Voice/FAX
(916) 666-1813

Safari Fonts #24 contains 3 new display fonts. All faces contain upper and lowercase characters as well as many foreign characters. Disk #24 contains files for PageStream in Type 3 and Type 1 format. PageStream and *Type 1* versions contain hundreds of kerning pairs.

Atari ST Calamus versions are *Outline-Art Capable* and contain no segments or "pieces" to ruin shaded or filled effects.

Safari Fonts works with all versions of PageStream including 2.1 and ALL PageStream supported printers including postscript. California residents add 6% tax. Write/Call/FAX us for our Catalog!

Right on Target

David Plotkin
Contributing Editor

> **As I see it, 1991 is it for Atari. Either they are going to get their act together this year or the curtain will fall.**

May 22, 1991. It's a day I'm going to remember for awhile. I turned 37 years old that day, and the phone rang around noon. The caller was my old friend and editor of STart magazine, Tom Byron. Tom was calling to tell me something you should be aware of by now—that Antic Publishing had "pulled the plug" on STart, and the premier Atari magazine in the US was no more. It was a sad event, both for what it says about the Atari market and what it says about Antic Publishing.

Stopping STart

What it says about the Atari market is old news, and it doesn't have to be rehashed here. The lack of product, of proper marketing, of advertising, of a coherent business plan, are all combining to hurt the people who threw their lot into the Atari market. The problem is that the situation has intensified to the point where the casualties are mounting at an alarming rate.

STart is just the latest in a long line of casualties. You don't hear from Migraph much anymore, and I was saddened to learn from Charles Johnson a few weeks ago that CodeHead Software does not plan to produce any new products for the ST. This isn't to say they won't support their current users, but they are bending their efforts into more profitable markets—like the Mac.

What it says about Antic, which has been one of the really staunch supporters of the Atari line, is very sad. STart magazine just couldn't make any money, despite the fact that it is an extremely lean magazine—very little permanent staff, agressive advertising reps, and considerable publishing know-how.

But the advertisers are hurting too, and my guess is they are not being real prompt about paying their bills to Antic. If Antic makes it (and the jury is still out on this), it will be because of the success of their PC magazine, PC Home Journal.

Jim Capparrell is striving mightily to keep Antic's doors open and make a go of it. He is using every trick in the book (and some that are not) to manage it, and from what I know of Jim, he may just pull it off. If he manages to get out a few more issues of PC Home Journal, he may yet succeed.

I sure hope he does. He and the rest of the Antic staff deserve better than unemployment for the years they have educated and entertained us. Jim has assured me that, if Antic can return to profitability, their debts (especially those to authors such as myself) will be paid. We'll keep a good thought.

And Now...

The closing of STart leaves the Atari world in a precarious position. There are certainly still valuable resources for obtaining Atari information around—AIM, Current Notes, ST Informer, AtariUser, Atari Explorer (admittedly somewhat of an Atari house organ). But STart was an institution, and probably the most widely distributed of the Atari magazines, with professional production values. It will be just that much harder for users and potential users to get information on our favorite machine.

It appears that the real hope for rejuvenation comes from Europe. There, the market share for Atari is sufficient to support some really professional software and hardware. The recent announcements from Goldleaf (publishers of Wordflair) illustrate this. Professional drawing and typesetting packages and the hardware to match is very impressive, though I'm not sure what the interest for such things in this country will be. Time will tell.

There are actually quite a few interesting products around—accelerators and other technical upgrades are making things exciting for those of us into such things. However, the software that appeals to the masses—that would convince them to go out and buy Atari hardware because of the awesome software, just doesn't seem to be there.

Not everyone will get excited about the latest version of Calamus (though it's very good), and some of the really fun stuff, like CAD 3-D, has basically just died on the vine. I recently noticed a new suite of 3-D rendering packages, but the advertising descriptions were so poor that I was hard put to figure what they did—not to mention the fact that they really worked best with such things as large-screen monitors and resolution enhancement boards—not the kind of thing the average user would go out and buy.

It's Up to Atari

That leads to another point. Atari really needs to get their more capable machines out the door. Most people are reluctant to upgrade their machines when it means tearing them open and clipping or soldering things inside. Thus, with Atari machines, the average user is going to be limited to what Atari supplies with the basic machine.

Open architecture machines, such as the PC, don't have this problem—if the user needs better sound, or graphics, or scanning, or whatever, he/she just plugs in a new circuit board. Of course, its not quite that easy (you usually have to mess with interrupts and jumpers, though the better designed boards are self configuring) but it's doable.

Thus, comparisons between basic PCs and STs always show the ST doing better in a lot of areas—but the PC can be upgraded to do just about anything. I wonder why Atari never produced an open architecture machine. Even Apple has a Mac with slots.

Finally

As I see it, 1991 is it for the Atari. Either they are going to get their act together this year or the curtain will fall. They need to get some neat, cool machines out there that people will fall over themselves to buy—and get those machines past the FCC. Me? I'm pulling for them like crazy, because I have used these machines since 1980 and I don't want to see them die. But I have hedged my bets—I've got a fully equipped 386 PC too. Hey—I'm loyal, but careful.

See you next month.

The sales blurb on the back of the MaxiFile III manual claims that it "is far and away the most advanced and powerful file management utility available for Atari ST/TT computers!"

With all the file-oriented utilities available for the ST, that's quite a claim. And MaxiFile III more than lives up to it. Just about everything you can imagine wanting to do to a file or disk can be done by MaxiFile III. There is probably no way to do complete justice to this program in a single review.

Like its earlier versions, MaxiFile III can be run as either an accessory or as a stand-alone program. Not everyone will want to use MaxiFile III as a desk accessory; it takes up 161K of memory!

For most users, running it as a program would be the best route. If, like me, you happen to have at least 2.5 megs of memory, you'll probably want to install MaxiFile as an ACC. That way, you can use it from within any GEM-based program that lets you access desk accessories (or from Little Green File Selector!).

A Whole New Look

MaxiFile III's user interface has been spruced up quite a bit from earlier versions, while still retaining its ease of use. When you first access MaxiFile, you're presented with two independent scrolling directory displays.

The left-hand display contains the "source" directory, while the right-hand display shows the "destination" directory. This is MaxiFile's "Dual-Display" mode. Clicking on the "1/2" symbol at the top left of the MaxiFile screen switches you into "Source Path Directory" display mode.

I find both display modes to be highly useful. Source Path mode allows viewing of up to 80 files/folders at once in the source directory, but you can't see what is in the destination directory without "swapping" paths. Although this is just a single click of a symbol in MaxiFile, you then have to click again to get back to your original source.

The new Dual-Display mode resolves this minor inconvenience beautifully. With independent scroll bars for the two directories, as well as the ability to scroll both directories simultaneously, MaxiFile III gives you the best of both worlds.

Add to this the replacement of text boxes with icons, and MaxiFile's display has become far more eye-pleasing. Having been a previous user of MaxiFile, I was thankful the CodeHeads left the buttons in relatively the same positions and only changed their look. That was a big plus in adjusting from text to icons.

Nifty Features

I'm not going to try to describe all the wonderful things MaxiFile can do, and I'm certainly not going to give step-by-step instructions on how to do them.

The excellent 80+ page manual for MaxiFile III, complete with a useful Appendix of keyboard equivalencies, does a superb job of that...plus it's fun to read. Hats off to Charles Johnson and Maurice Molyneaux for creating a usefule and entertaining manual on the subject of file management!

I will, however, try to point out some of the "nifty" features that I think make this program indispensible to just about every Atari owner.

The GEM Advantage

While file and disk management is not the most glamourous and exciting job, it is a necessity of computing life. When you have to work with a large number of files, the standard ST desktop just doesn't have the power and flexibility you might wish. That is why many people use Command Line Interpreters (CLIs) for complicated file manipulation.

The problem with all CLIs is that they aren't GEM-based; most are TOS program or they run inside a GEM window, but you still have to type your commands. And, you have to learn all sorts of intricate incantations to get the job done. MaxiFile gives you all the power and flexibility of a CLI in a point-and-click environment. You really can have the best of both worlds with MaxiFile.

From the MaxiFile screen, you can select individual or multiple files by clicking on their names. Holding down a Shift key while clicking a filename selects all files with the same extension (such as *.PRG). A Control-Click sequence selects every file. Alternate-Click highlights all files with the same first six characters in their names. And all of these options select every file in the source path matching the respective criteria—even if the files are not currently displayed on-screen.

A Fine Filter

Clicking on the Filter icon (or pressing 'F') gives access to MaxiFile's filter and file search functions. Up to 16 of the file extensions you select/search on most often can be defined here, plus you can enter your own criteria. Multiple file extensions can be used simultaneously—you can find all *.PRG, *.ACC and *.RSC files in one simple process! You can even select/search for files by creation date and time.

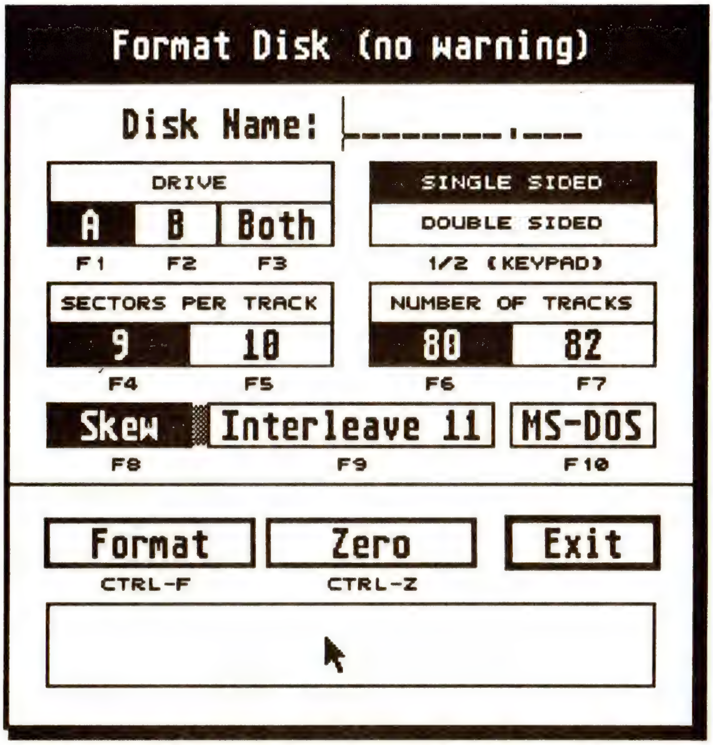
The Search dialog box allows you to individually select the drives on which to search. Alternately, you can select all drives or all drives from C: on up with a single click. Once the search begins, paths found that match your criteria are added to a "Search Paths Menu." You can select a path from this menu, and MaxiFile will automatically set this as the Source path and highlight the matching files (or even all files in the path if you like!).

Behind Door #1...

Clicking on the Door icon (or pressing the space bar) calls up a submenu packed with options. Near the top of the submenu, MaxiFile displays the version and creation date of TOS in your machine and the amount of free system RAM.

One of the most important features accessible here is the Format Disk option. The Format Disk dialog allows you to set a disk volume name; choose Drive A, B or both, and set single/double sided, 9 or 10 sectors per track and 80 or 82 tracks per disk.

An option to format true MS-DOS compatible disks is very handy if you transfer disks between an ST and IBM or PC clone. When formatting IBM disks, you have the option of 1:1 or 2:1 interleave. Users of TOS 1.4 or higher have IBM-compatible disk formatting built in to their machines, but I have personally found that some IBM clones cannot read these supposedly compatible disks. The extra features of MaxiFile's MS-DOS format option fix this problem.



The Copy Disk option is also a handy utility, as it actually analyzes the source disk's format and duplicates it on the destination disk.

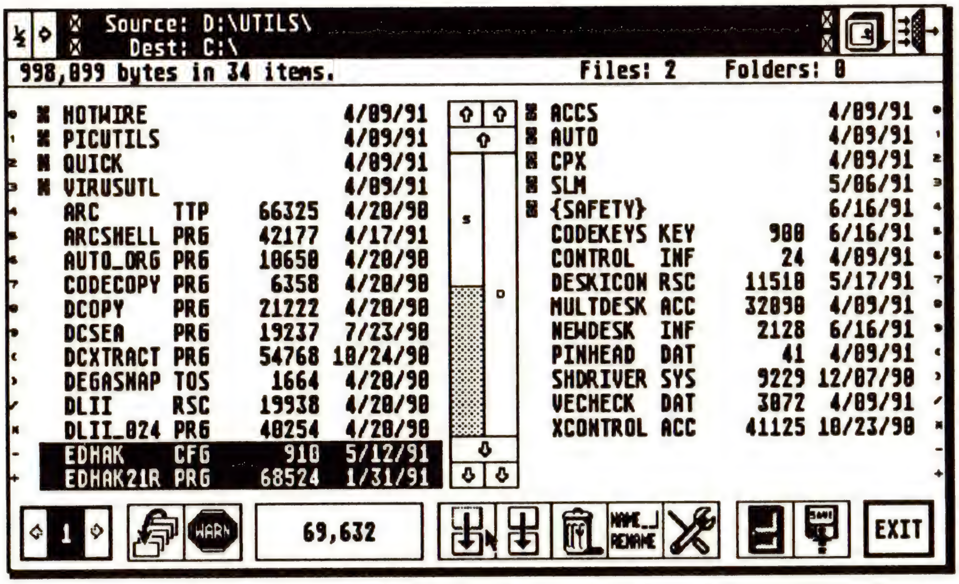
One of the most visually impressive options is Graphic Info. Clicking on this button allows you to generate a bar graph display of disk usage, with total drive capacity, bytes used, bytes free and percentages used and free for each drive. A grand total at the bottom sums up the individual columns.

A Wealth of Information

MaxiFile III's File/Folder Information dialog proves the old addage that information is a powerful tool. For folders, you can change the folder name, open the folder, move to another folder or add comments to the folder.

This ability to add comments to files and folders is a very nice feature of MaxiFile III. Up to three 48-character lines of textual description can be added to each and every file and folder on your system.

The File Information dialog lets you view a file on your screen or print the file to disk. MaxiFile's "view mode" is an excellent file viewing utility. You can easily move up or down a document, line-by-line or page-by-page. You can jump to the end, beginning or even the middle of a file with a single keypress. While viewing a file, you can search forward or backward for a word or phrase. You can use the left mouse button to



```

scroll forward and the right to scroll backward through your text files, as well.

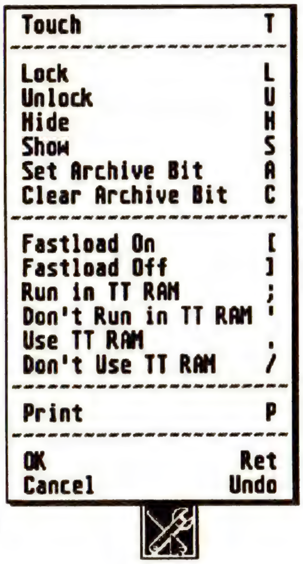
Read/Write or Read Only, as well as Normal, Hidden or System flags can be set from the File Information dialog. You can also set a number of "program flags" for executable files. These include FastLoad flags and flags for running or using TT Fast RAM.

Other Features

Setting these flags from the Information dialogs affects individual files. In addition, MaxiFile allows you to modify these flags for groups of selected files via the Tools icon.

You can rename entire groups of files by selecting a batch of files and clicking on the Name/Rename icon. MaxiFile presents each file, one after the other, for you to modify.

Clicking the Safe icon in the upper right corner of the MaxiFile III screen gives you the equivalent of a recoverable trashcan. When on, any files you delete via MaxiFile are copied to a folder called {SAFETY} in the root directory of the source drive. Using MaxiFile to delete items in the {SAFETY} folder actually deletes them permanently.



Users of HotWire and MaxiFile get the added bonus of being able to run programs from HotWire by simply double-clicking on the displayed names. MaxiFile can also be called directly from within Little Green File Selector, a shareware File Selector replacement that is included on the MaxiFile III disk.

Everything you can do in MaxiFile III by using the mouse, you can also do using keyboard equivalents. Everything!

You can save your configuration of MaxiFile III, so you don't have to reset often-used options. Your current paths, sort and warning options, disk format and copy settings, filter extensions and lots more are all saved.

Conclusions

In short, MaxiFile III is one heck of a great utility. In fact, it replaces a whole slew of individual programs. Unlike some "integrated" packages that do a lot capably while individual programs do individual tasks better, MaxiFile III does everything superbly. In fact, if Atari's executives managed their company as well as MaxiFile handles file management, the Atari world would be a happy place, indeed.

HOT

I'm a fan of desktop replacements and enhancements. I find that I like to spruce up and juice up my computing experiences as much as possible. I've tried, and liked, almost every package that falls into this category—NeoDesk, DC Desktop, SLICCTOP, VDOS Pro-Queue, Menu Plus, GoGo ST and the list goes on.

Most of the desktop enhancing or replacing programs are high on functionality and features. They all use up some degree of your system's memory, but what they give you in return is well worth the cost. And, each person will have their own favorites for one reason or another.

Personally, I like them all. But the one I use most—the one I have continued to boot my systems with for the last two years—has been HotWire from CodeHead Software.

Other software packages, like Menu Plus from Rimik or GoGo ST, also work in a similar fashion. Rather than do a feature-by-feature comparison with these other products, I'm going to stick to HotWire. *[Ed: A review of Rimik's Menu Plus will appear in a future issue of Atari Interface.]*

What It Is

HotWire is now at version 3.x and has come a long way over the years without losing its ease of use. In fact, it's gotten easier to use, in my opinion.

Before we get into how HotWire functions, though, it's probably best to discuss what HotWire is and what it can do for you and your computer.

HotWire falls into the category of desktop enhancements. You could, however, use HotWire exclusively—along with a couple other packages from the CodeHeads—and never look at the ST desktop again. Like most of these programs, HotWire is most useful to hard drive owners and not very practical for floppy-based systems.

The actual HOTWIRE.PRG file goes into your AUTO folder and is installed into your system's memory at bootup. You can define HotWire to "autostart" at bootup, or you can switch into HotWire from the desktop with a click of the right mouse button.

What HotWire allows you to do is fairly simple—it allows you to create menus from which you can execute programs. Of course, there are piles of other features, like Ledger Files, corner clock and alarms, environment variables, Work Files and more. We'll discuss some of these extra features later in this review.

Gourmet Menus

When you first use HotWire, you need to add your favorite programs into the HotWire menu. HotWire recognizes TOS, TTP and GEM programs. With

Corner Clock Options F4
HotWire™ Alarms F9
--- SAVE
Save Configuration F1

WIRE 3

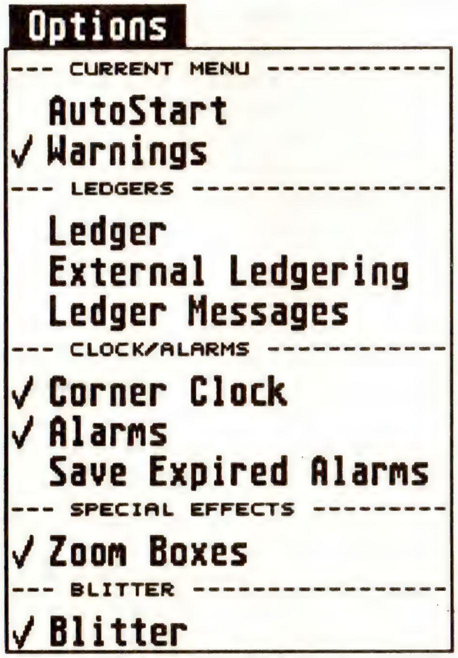
TTP files, you can include command lines—in fact, there are HotWire menus available from the online services that act as ARC shells, etc.

You can also create "headlines" to group programs by type within a specific menu. HotWire lets you go even one step further by allowing you to create "sub-menu" entries. You can, for example, put all utilities on one menu, all games on another menu, etc. Then, you can link the menus to each other via sub-menu entries in each individual menu. I use both headlines and sub-menus in my setup of HotWire.

With up to 54 programs per menu and the number of menus limited only by the amount of free disk space, you'll run out of programs before you'll run out of entries!

Program Entry Options

Although the concept of what this software does is simple, the way HotWire does it is unique and very powerful. To give you an idea of the power and usefulness of HotWire, let's look at the Options Box for a specific program.



Options

Once you have clicked on an empty cell in a HotWire menu, the File Selector appears. From the Selector, you choose the program you wish placed in the cell. After selecting the program, HotWire presents the Options Box. Let's split this dialog box up into four distinct parts for this discussion.

Identification

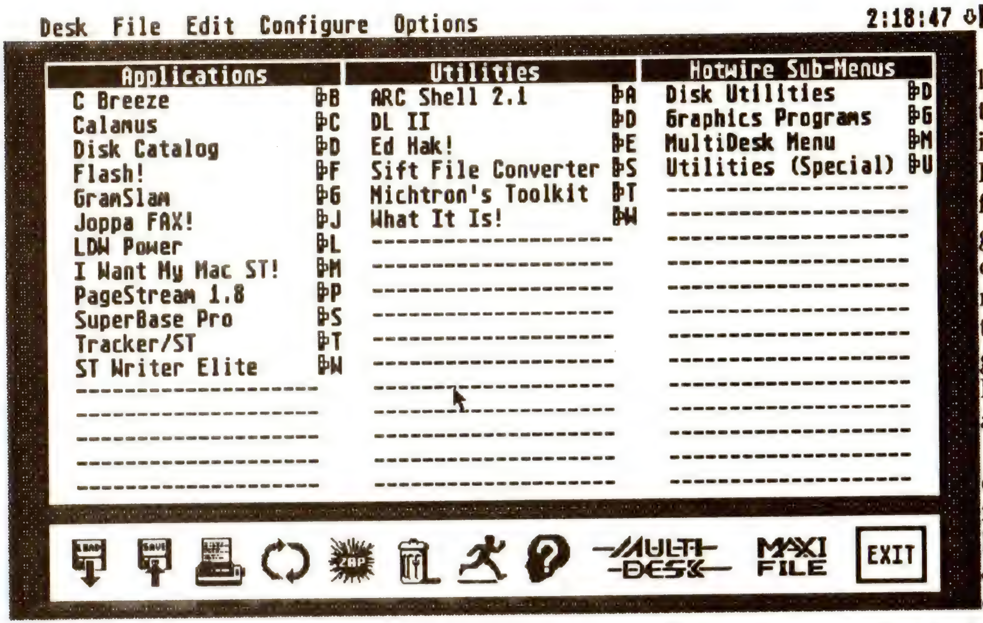
The first part, at the top of the Options Box, identifies the program. In the Title field, you enter the name you wish HotWire to display for the program. The Title need not be the same as the actual program, allowing you to give programs more descriptive names. You can also set the text color for your program entries.

Beneath the Title Field are four buttons that tell HotWire how to execute the program. The function of the GEM and TOS/TTP buttons are fairly obvious. Selecting the Command Line button causes the standard TTP command line to appear each time you run the program from the HotWire menu.

Running your TTP programs from HotWire in this fashion gives you the added bonus of being able to use the File Selector to input filenames. Clicking on the Exit Prompt button makes HotWire pause and wait for a keypress or mouse click after running TOS/TTP programs.

Further down in the Options Box, you can define up to four "document types" to be associated with this program. This works like the "Install Application" facility of the ST desktop. For example, let's say you have created a Calamus entry in HotWire. In the Documents section, you could add "CDK" as an extension. Then, you could add entries for any Calamus documents you use frequently, adding them to the Hot-

...the one I use most—the one I have continued to boot my systems with for the last two years—has been HotWire...



Wire menu as "document" files. By clicking on one of these document files, Calamus would execute and automatically load the chosen CDK file.

HotKey Selection

The second part of the Options Box allows you to pick a single key (or key combination) that can be used to execute the program from the HotWire menu or from the ST desktop. This is one of the most useful features of HotWire, in my opinion. Let's say, for example, that you have PageStream defined with a HotKey of Alt-P. To execute PageStream from the desktop, all you do is hold down the Alternate key and press 'P'.

HotWire allows you to define HotKeys using the Control, Alternate, Left and Right Shift keys, or any combination of the above, as well as single characters. In all, there are 416 possible combinations from which to choose!

On Atari's new Mega/STE and TT, these HotKeys do not function from the desktop. The CodeHeads say this was done to maintain compatibility with future TOS versions. Also, the newer machines use key combinations for their own purpose. The HotKeys do function perfectly from the HotWire menu screens on these new machines.

Return Options

The Option Box's next major section determines what happens when you exit a program you've run via HotWire. Just below the Documents fields are four buttons labeled Always, Never, Same and Opposite. Choosing Always will cause your system to always "return" to the HotWire menu, while Never causes your ST to always "return" to the desktop. Clicking on Same returns you to the same place from which the program was run (either the HotWire menu or the desktop). Opposite, obviously, sends you to the desktop if you ran the program from the HotWire menu, or vice versa.

Miscellaneous Options

For lack of a better definition, let's lump all the little buttons at the bottom of the Options Box into a miscellaneous catagory. Here, you can set how HotWire functions with individual programs. You can set HotWire to display (or not display) the corner clock, keep track (or not) of the time you spend in a program, use (or don't use) CodeHead's Button Fix accessory, and more.

I don't have room to go into detail on all of these features. I find some of them highly useful, like the ability to turn the corner clock on or off for each program. Others, like the password protection for individual program, I never use but can see how someone might find it important.

Global Blocks

HotWire 3.0 adds the ability to define a "global block" of programs. These are programs that are independent from any specific HotWire menu. The big advantage to this is that they are available at all times, no matter which menu or sub-menu you are in. You can switch from your main HotWire menu to a Utilities sub-menu and still retain access to your most-used programs.

Other Goodies

At the bottom of the HotWire screen is a row of icons for saving, loading or printing HotWire menus (.HOT files), configuring HotWire and even for executing programs not found on your HotWire menus. Also in this row are buttons allowing you direct access to MaxiFile and MultiDesk, CodeHead's file manager and desk accessory loader, respectively. Of course, you have to own MaxiFile and MultiDesk to take advantage of these options—and I strongly advise you to get these two utilities! *[Ed: See the review of MaxiFile III elsewhere in this issue. MultiDesk was reviewed way back in the April '89 issue of Atari Interface.]*

The HotWire disk comes jammed with a whole slew of HotWire-related utilities. HotSaver is a screen saver, mouse accelerator and hard drive park utility all-in-one. HotSaver works just fine without HotWire, but has some extra features—like displaying the time—when HotWire is present.

Other utilities on the disk allow you to edit HotWire menu files, globally change drive paths, etc. A special KIKSTART program allows you to get up and running with HotWire quickly.

Plus, the CodeHeads have thoughfully included the Button Fix accessory (stops that annoying double scroll of window bars in TOS 1.4), Little Green File

Selector and PinHead. There's more on the disk, including sample HOT files, but you get the idea.

Conclusions

HotWire has a lot to offer to anyone wanting to inject a strong dose of power into their ST desktop. The program is so unobtrusive that you will, most likely, forget it is even there. The addition to your system of HotKey execution of your favorite programs is something you'll find you almost can't live without. I give HotWire a definite thumbs-up!

$29.95

NEW! Quick ST 3

Software Screen Accelerator and Desktop Customizer

MAXIMUM SPEED FOR YOUR ST OR TT!

- Speeds up most ST software by speeding up screen graphics
- Text, GEM graphics, and GDOS fonts all redraw significantly faster
- Compatible with all ST, STE, and TT computers
- Supports all screen resolutions, including Moniterm and ISAC
- Fastest version ever! Even the "fast" TT speeds up considerably

- Easy to use! Install it in the AUTO folder or run it from the desktop
- Requires 20K to 40K of RAM (depends on the configuration)
- Includes the Quick Index 3 benchmarking utility
- Include the MonSTer high resolution screen emulator

- Install any DEGAS Neochrome or Prism Paint picture on the desktop
- Change the desktop font and icons with our font and icon editor
- Install a different font and picture for every program!

CODEKEYS

Bill Rayl

I don't know how many times I've had a program that makes me go through the exact same sequence at bootup and I've said to myself, "Gee, I wish there was some way to automate this." Short of writing to the author and hoping the program would be updated to make my life easier, my options were very limited.

CodeKeys from CodeHead Software to the rescue! This little combination AUTO program and desk accessory package can be a godsend to anyone who wants to automate part or all of a given program.

Although this is one of the few CodeHead products that not everyone will need, I think most people would find CodeKeys useful if they had it. Ever wanted to add keyboard equivalent to the desktop's drop down menu commands? Well, you can get one of the newer machines with TOS 2.0 or higher...or use a replacement desktop...or you could use CodeKeys to get the job done.

BBS sysops, how would you like to set your BBS to automatically back up your important system files at a specific time each night? CodeKeys can do it for you, while you're sound asleep.

User group members needing to do demos can automate the demo process, complete with dramatic pauses, freeing the demonstrator from sitting at the computer and allowing for a better overall presentation. CodeKeys is the next best thing to a VCR for demo purposes!

The possibilities are as endless as your imagination. Anything...absolutely anything...you normally do on your computer can be recorded and played back by CodeKeys.

How It Works

The CodeKeys package consists of two programs. The first goes in your AUTO folder and actually does the macro recordings. The desk accessory allows you to edit, name, save and load CodeKey macros. While it is not necessary to install the desk accessory to use CodeKeys, you will want it around when you are first creating your macros.

Once you have installed the CodeKeys executables and rebooted your system, you are ready to start recording. Creating macros is a simple process. In fact, the most complicated thing you have to do is decide whether you want a normal or "timed" macro. A timed macro is one that runs at exactly the same speed at which it was recorded, and is very handy for program demonstration. Normal macros, which run as fast as possible, make your ST look like it's just gone into warp drive.

Depending of which form of macro you choose, you press a given key combination to start recording. CodeKeys asks you to supply a macro number (1-32), and then requests a trigger key combination that you will use to invoke this macro in the future. Then, you go about doing whatever it is you want to record—accessing drop down menus, running programs, even calling other macros. When you are done, another key combination tells CodeKeys to stop recording.

That's it. The macro has been created and is now ready for your use! To play back a macro, all you have to do is press the trigger key combination you defined while recording.

Accessory to CodeKeys

Well, that's really not *it*. There are lots more options, and most of them are editable or available through the CodeKeys desk accessory. One of the most impor-

tant of these options is direct editing capability of your macros.

The left side of the CodeKeys accessory display contains the Macro Display Window. All the commands (called "events") contained in a selected macro appear here. You can scroll through the macro, and add, delete or change events. These features allow you to fine tune your macros, adding or removing timing delays as needed, etc.

Clicking the Options button lets you define a number of useful functions. Probably the most important of these are the Repeat 0, Repeat 1, Delay and Scheduled options, in conjunction with the Time and Repeats fields. Selecting Repeat 0 or Repeat 1 tells CodeKeys to repeatedly play the macro once it is triggered. The timeframe and number of times to be repeated are indicated in the Time and Repeats fields.

Macros set with Repeat 0 will begin executing after the time interval, while Repeat 1 macros begin playing when triggered, then wait for the specified time interval before playing again. It sounds complicated, but it isn't.

For example, let's say you do a lot of word processing, but your program doesn't have an autosave feature. Use CodeKeys to record a "Save Document" macro. Set this macro to Repeat 1, Time of 00:05:00 and leave the Repeats field blank. You now have a macro that saves your document immediately upon being triggered, then automatically initiates a save after every five minutes until you manually turn off the macro.

The Delay option sets a macro to play once after a specified time period has elapsed. Scheduled macros play at preset times, such as 4 AM. Scheduled macros are useful as an alarm clock, backing up important BBS files late at night, etc.

Other Options

The CodeHeads have given CodeKeys lots of other nifty options. You can, for instance, create what is called a Link File. This file "links" individual macro (*.KEY) files to specific programs. When programs in this list are executed, their corresponding macros are automatically loaded.

For example, you could create a special KEY file for your word processor that contained all the macros related to that program. In this KEY file, you could include the "Save Document" macro mentioned earlier. Whenever you ran you word processor, these macros would automatically load and be ready for you to use. Then, when you exited back to the desktop, those macros would be unloaded and your "global" macros reinstated.

With 32 different macros possible for every program you own, you'll run out of procedures to automate before you run out of macros!

CodeKeys can also be disabled by a key combination at any time. This allows you to turn off all macro playbacks. Another key combination gets you going again.

Users of CodeHead's HotWire have the added ability to load KEY and Link files by using LOADKEYS.PRG. While this program can be used from the desktop, it is far more useful when placed on a HotWire menu with KEY and Link files included as "documents."

The following chart gives version numbers and suggested retail prices for all CodeHead products as of Monday, June 24, 1991 are:

CodeKeys	1.3	$39.95
G+Plus	1.5	34.95
MultiDesk	2.2	29.95
LookIt & PopIt	1.2/1.1	39.95
MaxiFile	3.0	44.95
HotWire	3.0	44.95
HotWire Plus (HotWire & MaxiFile)		69.95
MIDIMAX	1.3	49.95
CHead Utilities	Rel #4	34.95

CodeHead Products are available from your local Atari dealer, through mail-order houses, or directly from CodeHead Software at P.O. Box 74090, Los Angeles, CA 90004, Ph: (213) 386-5735 FAX: (213) 386-5789 BBS: (213) 461-2095

CodeHead Software accepts Mastercard, Visa and American Express, as well as checks, money orders and cash. Shipping charges are $3 US, $4 Canada, and $6 elsewhere.

Current office hours are Monday-Friday 9AM-1PM Pacific time. Prices and hours are subject to change without notice.

LookIt! & PopIt!

A Double (Code)Header

PopIt! is one of those "neat-o" little hacks we've come to expect from the CodeHeads.

In the CodeHead tradition of producing excellent utilities at a reasonable price, the LookIt! & PopIt! package gives you "two powerful utilities for the price of one."

The only connection between these two programs, other than being in the same software package, is that they are both programmed by Doug Harrison. LookIt! & PopIt! is the first CodeHead package not written by Charles Johnson or John Eidsvoog. Both programs live up to the "CodeHead standard," though. While LookIt! is the most impressive of the two programs, PopIt! is one of those "neat-o" little hacks we've come to expect from the CodeHeads.

LookIt!

LookIt! is, to put it simply, a file viewer and binary file editor. The user interface is very Macintosh-like. For some, this could be a hindrance; for others, a major plus. The manual explains the interface quite nicely, so no one should get lost. Users of the Spectre Macintosh emulator or GEMINI replacement desktop will feel right at home.

If you're a GEM purist, don't let the interface turn you off to this program. LookIt! is the fastest file viewing utility I have ever seen. I'm not talking about the kind of speed up you get with Quick ST or Turbo ST. I'm talking blindingly fast.

To give you an idea of the kind of speed I'm talking about, I did a test using a 97K text file. From the ST desktop, with Turbo ST installed, it took me exactly one minute to get from start to finish of the file. Running LookIt! on that same configuration, I scrolled through the same file in 22 seconds!

Speed isn't all that LookIt! has to offer. You can load up to 32 files at once. Up to four "bookmarks" can be placed in each file, allowing you to jump to a specific point in a file with a single keypress.

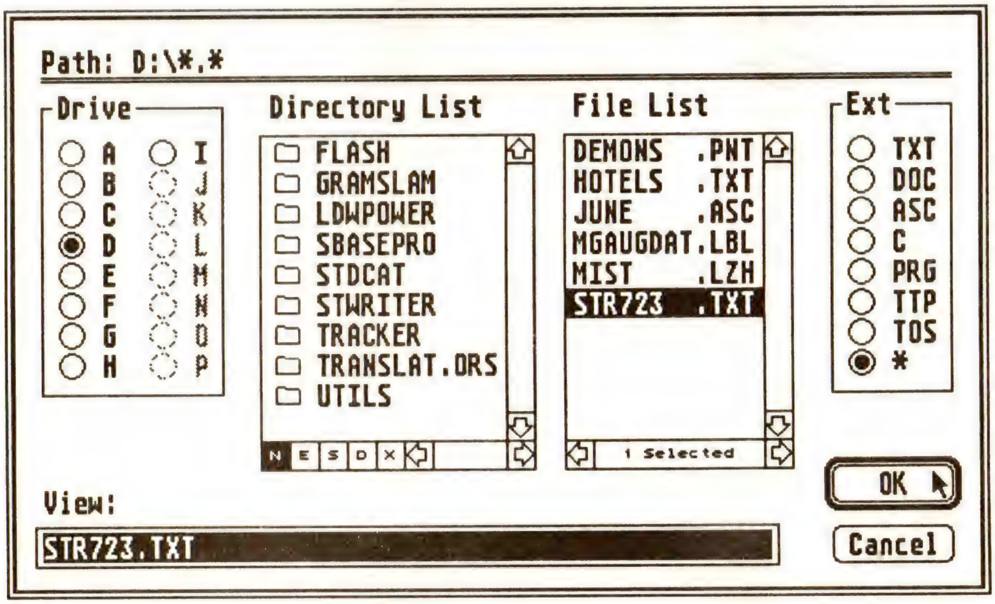
Expressive Searching

LookIt! gives you word/phrase searching capabilities using "regular expressions." In other words, you can do some pretty complicated searches using some fairly simple to learn operators.

For instance, to find all words that start with a capital letter or all lowercase words ending with "ing," you could search using this expression—[A-Z]+ [a-z]* | [a-z]*ing. That kind of search capabitily is hard to find even in highend word processors. Users of UNIX and egrep will, no doubt, recognize this form of searching.

While many users may not need the kind of searching power LookIt! offers, it sure is nice to have the capability.

When in Binary viewing/editing mode, you can search using ASCII, Decimal or Hexidecimal inputs.



Path: D:\*.*

View: STR723.TXT

Printer Control

Once you're done viewing your file, you might wish to obtain a printout. LookIt! can do this for you, as well. LookIt! has a pile of useful print options, and comes with printer drivers for the HP DeskJet in 66 and 132 lines-per-page mode, as well as for standard Epson and compatibles. If the predefined drivers don't suit your needs, you can define your own printer configuration file.

Other print options include final/ draft, condensed printing, use of extended characters, printing a header on each page and setting of left, right, top and bottom margins.

LookIt! HotWire Menu
by Terry May

HotWire Main Menu ⌂M

Command Line

Users of HotWire or any other program execution shell that can send command lines can really have fun with LookIt! LookIt! comes complete with a very powerful predefined HotWire menu allowing you to load from one to five files with a click of the mouse.

Using the command line, you can actually load multiple files into LookIt! simultaneously, with some files loaded in text viewing mode and others in binary. Once in LookIt!, you can switch from file to file with a single keypress.

PopIt!

PopIt! is a very uncomplicated kind of utility. In fact, the 50+ page manual for LookIt! & PopIt! contain only seven pages for this program. It's the kind of utility that is super easy to install, and once you start using it you forget it is even there.

What PopIt! does is assign "hotkeys" to your desk accessories, allowing you to open a desk accessory with the press of a key combination. Nothing earthshaking, but definitely a useful utility. PopIt! even works with desk accessories loaded by CodeHead's MultiDesk.

As a devout MultiDesker, I really like what PopIt! does for me...allows me to access my desk accessories without moving to the Desk menu, clicking on the MultiDesk entry, then selecting the appropriate accessory.

PopIt! can keep track of up to 50 different desk accessory definitions per configuration file. You can load and save these configuration files on the fly. PopIt! does not, however, load any desk accessories—it only allows you to add hotkeys to the currently loaded accessories.

You can also call any active desk accessory by double-clicking on its name in the PopIt! window.

The Portfolio Hand-Held Computer: A Business Tool

Bill Kithas (HACE)

I am employed by an Oilfield Service company that records logs (graphs) of oil wells to assist oil explorers in pinpointing and evaluating oil- and gas-bearing rocks. This describes how I use the Portfolio to assist me in doing my job.

With the introduction of small, hand-held computers and small portable printers, computer-assisted well log analysis can be performed anywhere. All equipment can be carried in a briefcase. Along with this portability, you have the ability to do basic word processing, spreadsheet analysis, maintain an active diary and maintain a dialing/address book.

Any business application for which you may use a laptop computer can be performed by these small computers. The Portfolio computer was the first hand-held computer introduced to the American consumer. The use of hand-held computers will greatly expand the capability of the log analyst and technical representative beyond the technology provided by programmable calculators.

1989 was the year the computer industry introduced small, hand-held computers to the U.S. consumer market. The Atari Portfolio was introduced in September of 1989. Basic specifications are:

List Price: $399.00
Power Specs: 3 AA batteries.
RAM: 128K / 640K
Media Storage: Ram Card
Screen Size: 240 x 64
Keyboard: 63 keys
Size: 1.2"H * 7.8"W * 4.1"D

The Portfolio is the hand-held of choice for the following reasons. First, it has built-in software that covers all the needs of a Sales Engineer, Log Analyst and Manager. Second, the size and weight are excellent because of comfortable transport wherever your job takes you. The final reason is the reasonable cost. The availability of portable printers for about $300 provides a complete system at the cost of the next competing hand-held computer.

These three facts, once recognized by technical people on the move, will cause a dramatic change in the portable computer business. As these machines become more powerful and more reasonable in cost they will replace the programmable calculators.

Built-In Applications

The Portfolio has the following built-in applications that allow the businessman to conduct his everyday business with a portable computer.

The Operating System for the Portfolio is resident in the computer's ROM and is compatible with MS-DOS 2.11.

The Address Book allows the user to compile as many separate books as he wishes and the only limitation is memory. Notes and comments may be recorded with each entry, as well as several phone numbers per entry. An option allows the auto dialing of a selected phone number.

The Calculator serves as a continuous business calculator or a scientific calculator. Remember, these applications are in the machine's Read Only Memory (ROM) and are retained even if the machine is left without power. No part of RAM is used for program storage by any of the resident applications.

The Diary has a Calendar that can be scrolled to the future as well as the past. As many appointments or messages can be entered for each date as you desire. The Diary can be actively edited and its contents may be printed. All the applications allow printing of their active contents.

The Editor is a simple word

processor. This article was written using the editor. The saved file was then transferred to my office PC and copied directly to a 720K IBM-formatted disk. This disk, as you know, is compatiable with the ST.

A file from the Editor can then be imported into ST Writer, Wordwriter ST or Timeworks Desktop Publisher. I am sure other programs will accept these TXT files, but these programs were the only ones tested. The Portfolio can be used as a portable text editor for the PC, the ST and probably the Macintosh.

The Setup utility allows configuration of the Portfolio's bells and whistles and printer, RS232 and file transfer setups.

The Worksheet is a Lotus 1-2-3-compatible spreadsheet. This application allows the user to perform many basic business functions that can be done using a spreadsheet. Log analysis, expense account entry and printing, job price calculations, financial record keeping and forecasting are some of the uses of this spreadsheet. The same IBM and ST compatibility applies to the worksheet WKS files as the editor files. VIP Professional, Masterplan, LDW Power and others read the worksheet files. The remainder of this article will cover examples of the worksheet utilization.

Open Hole Logging Job Pricing

The Worksheet application allows the use of Lotus 1-2-3 WKS files or templates. One such template is a simple spreadsheet that allows the user to make a price estimate for a normal open hole logging job. Once the user becomes familiar with the mechanics of using a spreadsheet, he or she can easily modify this template for custom needs and even save these custom templates for future use.

Most of the entries for this template are in one column. This makes the actual pricing very fast. Discounts may be set for the entire job as well as changing the discount for special services. This template will handle wells of any depth on land or offshore.

Basic Log Analysis

Log analysis is done using the Worksheet application. The benefits recognized for the pricing template apply to any other spreadsheet template. One template is for quick look (or basic) log analysis, another is for Complex Lithology Reservoirs. A shaley sand template and a pulsed neutron template are not, as yet, ready but are being developed or tested.

These templates provide a print that is similar to the handwritten worksheets commonly used. The equations used in this spreadsheet are in popular use and no proprietary information is used.

In the basic template, porosity is calculated from Sonic travel time using the input matrix velocity. Porosity can also be input as density or neutron porosity values. The density and neutron porosities are averaged using special averaging functions that duplicate crossplot porosities very well. This is the default porosity.

To use the sonic porosity, the density and neutron values must be omitted. Water saturation is calculated by either the Archie Equation or the Humble Equation. This option is selected in the heading. As an aid to the log analyst, Rwe can be calculated from the SP. This is also provided in the heading.

Resistivity of any water can be corrected to a bottom hole Temperature in a part of the spreadsheet. Also the Rwa and Ro for each zone is calculated. The traditional disclaimer is included in the printout of each analysis worksheet.

Conclusions

Of the available hand-held computers, the Atari Portfolio is best suited for use by mobile technical professionals. Those who need large file capacity may choose a laptop. However, most large applications are done on a desktop machine. The cost, size and built-in software make the Portfolio the most acceptable choice. Normal business applications are provided by the Portfolio making it desirable for the average businessperson.

By combining the Portfolio with a small portable printer, a complete, complex system can be carried in a briefcase for only $760 (plus tax). As consumers recognize and accept this, the use of hand-held computers will exceed the use of programable calculators.

So You Want to Start a User Group?

A Primer for Starting Your Own User Group, Part 1

Tim Holt (ACCEPT)

The computer sits on your desk, shiny, new and ready to take you on a cruise you have never been on before. You got your word processor, your spreadsheets, your databases, and all the other neat things the guy at the computer store could sell you. Your tax rebate check is gone, and your wife wants some results from that expensive "toy."

You crank up the word processor and start into the 576-page manual: "Make sure interface A is solidly connected to your camshaft before you begin any operation of your wing nut removal system..." It is going to be a long time before grandma gets her letter.

How could you avoid the hassles of computer ownership? How could you find out how Part A slides "easily into Slot B?" And, most importantly, will grandma ever get her letter?

Well, you could go back to your dealer, but chances are they would have to fit you in between customers. And, frankly, they thought you were smart enough to figure the computer out before you bought it. It would be *embarrassing* to go back to them. You convinced them that you were smart, and going back would prove they were wrong.

The best bet would be to find another computer user who was at one time in the same mess you are in now. Another user who could guide you through the programs. Even better, a group of users who could help you, whose brains you could pick, and who wouldn't make you feel too stupid. What you need is a *User Group.*

What do you say? There is no user group in your area? Well, why not start your own? In this series of columns we will hopefully describe how someone can get a user group going in their area, what to look for, what to avoid, and how to keep that club going even after you have it well established.

Of course, this is just a generic outline of how to get a group going. The rest will be up to you. Like art, the limits in any user group are the limits of your imagination. You will do things that we have never tried, and some of the things we have tried won't work for you. But hopefully, this series will let you at least see the way to go.

What, Why and How

1. What is a user group, and do I belong?

A user group is defined here as a group of people with some sort of similar interest (i.e., the computer). This group meets, either formally or informally to discuss how to make the computer a more useful tool for them. If you do not think you are getting all you can out of your computer, then you might enjoy the services of a user group.

If you are a master of everything about computers, then a user group would be a great place to display the fruits of all your hard work. In other words, a user group can be fun for just about everyone.

2. Why form a user group? Wouldn't just talking to your friends be enough?

Well, this idea works if all of your friends own exactly the same things you do. Chances are they don't. Chances are also pretty good that your friends are not using the computer for the same purposes you are.

The old cliche that two heads are better than one works well here. Input from a wide variety of sources is extremely important. You didn't buy the first car you ever saw, or the first computer. You shopped around and got a variety of ideas.

A user group facilitates the wide variety of inputs, the bantering around of new ideas. Some fellow from the other side of town, or in another city, might have a solution to your problem that your inner circle just can't figure out. The sharing of ideas is *the* major reason user groups are formed.

3. Okay, I want to form one. How do I do it?

Well, you just can't expect a user group to form overnight. Some careful considerations are in order *before* you even have a first meeting.

Check the Numbers

Consideration #1: Will your area support a user group?

Get a feel for how many other similar computer users there are in your area. If you are the only one in a 300 mile radius, chances are a group won't work. However, if you know of several other people with your type of computer, chances are there are many others that you do not know about. (Kind of like roaches—if you see one, there might be thousands in the walls....)

Put a "feeler" up on a local BBS that supports your computer. Ask the dealer nearby if they would ask customers about starting a group. Put a poster up in the local computer store saying a user group is forming, and to call you if they are interested. This should give you a pretty good idea.

Make an effort to let it be known that you will be having an organizational meeting. Make the date and time convenient for most people. The organizational meeting for our group was held in a food court at a local shopping center. The reason being, the mall was well known, easy to get to, centrally located, and neutral. Folks might have qualms about going to some stranger's house. If you find that a few people are interested, great. Don't be discouraged by a low turnout, either. Our first meeting had 5 people show up!

Consideration #2: Where are you going to meet regularly?

Well, you can't keep meeting in the middle of the mall, so you had better find a place that facilitates your club's gathering. Here are several things to look for in a meeting room—lots of chairs (for the big crowds!), lots of tables (gotta put those computers somewhere) and lots of electrical outlets. If you know a place that meets those criteria, go for it. (This also knocks out most people's homes.)

Public libraries usually have meeting rooms they will let you use. They should let you use them if you tell them you are a non-profit organization. Since your taxes help pay for the library, most cities allow clubs to use the meeting rooms in libraries.

Public schools also make nice meeting places. Lots of chairs, etc. However, most schools are not open on Saturdays, which is a traditional meeting day, and many of them are not usable during the summer. Check with your local school district on their policy towards clubs using the facilities.

Churches usually have meeting rooms and tables with chairs. If you have a close relationship with a local church, go ahead and ask them if you can use the room once a month. They might ask for a small donation, and if it isn't too outrageous, go for it.

The dealer who sold you the computer might have an open area in the back of the shop that you can use. This is especially nice for you because you get to use their computers and see the newest gadgets right in the store. It is also nice for the dealer, because he gets a group of users that are always looking for the newest and neatest stuff, and he essentially has a captive audience for a few hours. Good for you, good for him.

Other options: I have heard of clubs meeting in banks, Shriner's Halls, Bingo Parlors, the local college. You name it, they meet there.

Remember, though, if you can save money, do so. If you have a choice between a free place and a $5/month place, go for the free one if they are similar. Some places make you sign an agreement for a period of time, say, a year. Don't sign one that says *you* will have to pay so and so. *You* will get stuck with the bill if something happens. Try to find a place that has no monetary restriction, such as security deposits.

That's why our club meets in a library. We have an agreement that says our club will meet there the second Saturday of each month for an entire year. No other user can use the facility during our time, from 12:30pm until 3:30pm.

Consideration #3: How will the group be structured?

Traditionally, a club of *any* kind has the basic officers.

President: The grand marshall. He oversees all the goings-on of the club. This person sets the agenda of the club and is responsible for making sure that things run smoothly. In many clubs, the president is EVERYTHING! Don't let this happen. For one, he will get burned out real fast OR he will go on a power trip that will alienate the rest of the membership. When things go well, the president looks good. When things go poorly, the president looks real bad! If you have a traditional club, make sure the president shares responsibilities.

Vice President: This guy fills in for the president when the president is away, sick or resigns, as in the case of our club! Sometimes, the president just flips out, and the vice president must be there to fill in. (I would tell you about our flipped out president, but there are still a few in El Paso that are sensitive about it...)

Toadfile 44 Magnum

Toad Computers, the folks who brought you the original 44MB Removable Cartridge Hard Drive, have another great deal! The Toadfile 44 Magnum. It's our famous Toadfile 44, with three removable cartridges - one filled with PD software, too! Order yours TOADAY and enjoy unlimited storage, high speed (25ms), and absolutely legendary support! (Choice of vegetable or garden salad.)

COOL PRICE, ONLY $849!
Standard Toadfile 44, $699!

New Atari 1040STEal!

Toad Computers has a major edge over most places selling the STE Computers. We're an AUTHORIZED ATARI SERVICE CENTER! That means that if there's ever a problem, WE can fix it. We're not some cro-magnon reseller that's going to tell you to "throw it away" if it's broken, expecting another major cash outlay. We'll even extend your warranty to ONE FULL YEAR for $49.95! Now that's a deal!

Atari 1040STE, Only $399!
1040STE 2MB, Only $599!
1040STE 4MB, Only $699!

AUTHORIZED ATARI SERVICE CENTER

SPRING DEALS: SLM804 LASER TONER - $49.95!
SUPRA 2400 and Cable - $99.95!

Secretary: This person is in charge of the club's office work. Mailing out letters, filing newsletters, keeping the membership informed about the goings on in the club. Also, the secretary often will take the minutes of the meeting to be read at the next meeting. The duties of the secretary are often closely related to the Treasurer.

Treasurer: The person in charge of the club's money. Your club will have to get a bank account and this person is in charge of it. Make sure it is someone trustworthy.

Also, make sure there are specific guidelines for how money should be spent. Can the treasurer take money out of the account by himself, or must two officers sign for money? Can the officers spend money *between* meetings, or must all transactions be approved by the membership? All of these questions must be answered *before* anyone should be allowed to play with the money.

Sure as shooting, if you spend money, someone will ask why. Since the membership money was paid by the members, they will demand an accounting. They have the right to one at any time. It's really their money. Sometimes, the officers of a club will get cocky and think that the money belongs to them. That is why safety guidelines should be established, to protect everyone. In many smaller clubs, the secretary and the treasurer are usually the same person.

This traditional method is rather like a triangle, with the president at the top, and the regular members at the bottom.

There are other ways to structure the club as well. ACCEPT has no officers per se, but rather a three-member executive committee that meets on occasion.

There are no *rules* that say your club must have things a certain way. Our group started out with the traditional officers, but evolved into what we have now. No one way is correct. You may decide that officers are needed, or you may decide that officers are a pain. If it feels good, do it.

Can't decide? Well, that's one of the neat things about user groups, someone will always come up with an idea. (Sometimes the ideas are pretty lousy, but every once in a while, a gem comes through.)

So you have decided to form a group, you got a meeting place and have decided on the organizational aspects. Next time, we will discuss how to get members, and what you have to offer them in order to keep them.

LDW Power Users!

Templicity™

Home And Small Business Templates

If you hate setting up spreadsheets and making up formulas, Templicity™ will save you time. Instantly calculate and analyze mortgage rates, evaluate a car loan, estimate the maximum affordable price for property, design a savings program for a child's education, etc. This package of 104 prefabricated spreadsheet templates covers everything from bookkeeping and budgets to inventory and real estate. Interactive tax templates aare upgraded each year for $5.00. Available in separate versions for LDW Power and VIP Professional. $39.95

"Templicity is an excellent value and I highly recommend it." Amiga World, October 1990
"...a wealth of tutorial material..." ST Informer, Sept. 1988
"Templicity gives you ... a lot for your money." MACWORLD, August 1990

Blank Disks

These are the same double-sided double-density Sony™ high quality disks that we use for our products. We buy disks in large quantities and pass the savings on to you. 50 3 1/2" disks--$39.95

New for PageStream Users!

Qwikforms™ for PageStream™

The key to quick and easy, professional-looking forms and documents is Qwikforms™ It's the only package of forms with over 100 different, adjustable layouts. Just choose the one you want, insert your name, logo, or text, and print. Business forms include invoices, inventory control, real estate forms, job estimates, applications, organizers, ledgers, charts, etc. Page layouts include newsletters, letterheads, business cards, brochures, booklets, envelopes, press release, resumes, etc. Legal forms include wills, deeds, claims, bill of sale, power of attorney, etc. Personal forms include announcements, cards, architectural symbols for home planning, mail lists, invitations, etc. There are also guides and many other unique and unusual uses of PageStream. Includes 2 free disks of PD clip art, symbols and logos, calculator accessory, and other useful desktop publishing accessories. State which computer you have. $39.95

Cliptomania™ 10 full d/s disks of high-res PD clip art in IMG format for use with PageStream, Easy Draw, Touch-Up, and Calamus. Categories include Advertising, Animals, Cartoons, Fantasy, Holidays. Letters, People, Restaurant, etc. Over 360 images! $39.95

ClassicWare™

A complete package of the 100 best shareware programs for word processing, database, graphics, games, education, utilities, music, telecommunications, desk accessories, etc. 10 double-sided disks! Save dozens of hours downloading. Includes STWriter, STSheet, VanTerm, DevPacSt, Anist, MasterPaint, MidiSeq, KidsABC, PicSW7, Pinhed1.3, DCFormat, etc. These programs are shareware or public domain and a contribution to the individual author is often requested and rewarded with additional support and upgrades. $39.95

STers, Don't Let Your 8-Bits Grow Up To Be Doorstops!

Thomas Girsch

Copyright 1991, Thomas James Girsch [NOTE: This article has never before been printed, and has not been submitted to any other publication. One time printing rights are hereby granted to Atari Interface by T.J. Girsch].

Someday when you've got some hours to kill, go back and boot the old thing up, and see how much fun they really are.

The Atari ST is a wonderful machine. So wonderful, in fact, that I seem to keep investing more money (that I don't have) to enhance my system. After acquiring a hard drive, I found myself a bit stripped for cash, with only one solution in sight. "Old Faithful," my 130XE system, would have to be sold.

Now, while I certainly liked my 8-bit (it got me through middle and high school), I figured I wasn't using it, I had no room for it, I have no time for it, and so on... So, I dug it up. And boy, did I find all the neat stuff I had with it!

I heaved a sigh. I no longer wanted to sell this old beauty. While the applications can easily be replaced by those on my ST (better, in fact), there are some old games on the 8-bit that I miss dearly that cannot be obtained for the ST. I longed for the time to use them again.

Star Raiders—While it's true there was an ST conversion of Star Raiders, the general consensus is that it was nowhere near as playable as the old 1978 Atari 8-bit classic. I probably spent more time with this one over the years than with any other game. Never did master it, either. *That* was a game with lasting appeal.

Ali Baba—This was another of the all time 8-bit faves. OK, so the graphics were poor, but the game was so much *fun!* I used to have groups of people come over and I'd dig out the ol' 400 with 4 joystick ports. We would literally play for 5 or 6 hours. They just don't make fantasies like they used to.

Koronis Rift—Toward the end of the 8-bit heyday, Lucasfilm developed some excellent titles. KR was probably the best of these. Long hours went into this one, too.

M.U.L.E.—This one is probably the most widely missed of the 8-bit games. I don't know how many Atari shows I've been to where people would cry out for ST MULE! I even heard talk of "MIDI MULE." Sometimes the simplest games are the best, and MULE was a perfect example.

Alternate Reality—Only two modules of this one—City and Dungeon—saw release, but boy were they ever good. Many people I know preferred 8-bit Alternate Reality Dungeon over ST Dungeon Master!!! The City saw ST release, but to the dismay of many, it paled in comparison to its 8-bit counterpart.

So many of these I found. "God," I thought, "how can I ever get rid of this???" Still, the empty wallet calleth. I was forced to sell the old system. And I felt torn asunder, as if an integral part of me was missing. I realized then that I had been an 8-bitter for ten years!!! There was only one way to solve this dilemma, and I exploited it—I sold the 8-bit to a friend. That way, I can still get at it when I go through my "8-bit withdrawal" symptoms.

Many of you STers, I am certain, still have your 8-bits laying around somewhere. Some of you may still even have them hooked up. Someday when you've got some hours to kill, go back and boot the old thing up, and see how much fun they really are. You may even begin to miss it as much as I do.

Who knows? Maybe I can scrape up the cash for a Branch Always 8-bit adapter....

AAAUA ATARI 8-BIT USER GROUP

Presidential Ponderings—May 1991

On May 14th and 15th, the ninth annual COMPUTER & OFFICE SYSTEMS SHOW, was held at the San Antonio Convention Center. American Show Management, who organized and conducted the show, invited all computer user groups in San Antonio to participate and to hold a user group meeting at the Convention Center the evening of May 14th. The show management also provided a booth for participating user groups to display and distribute posters advertising their respective groups.

AAAUA accepted the invitation, as did several other user groups, and held an Atari Historical Exhibit from 7-9 PM, on Tuesday, May 14th. It wasn't a complete exhibit of all Atari products, but we did have a fair representation of computers from the Atari 400 up to the Atari ST. We distributed and posted hundreds of posters and talked to dozens of people.

Although thousands of people attended the main show, only a few found their way to our Atari exhibit. This was rather disappointing, but understandable. The show was virtually 100% MS-DOS oriented and most of those attending had that mindset. Also, two of the user groups who participated were "PC" groups, and their "PC" oriented presentations lured attendees from our "off brand" exhibit.

This experience at the San Antonio COMPUTER & OFFICE SYSTEMS SHOW served to highlight, once again, the entrenchment of the IBM and clones in our business community and the vast difference between the business user and the user group member. The typical business user looks at the computer simply as a means to an end; the user group member looks at his or her computer as a source of pleasure and entertainment, while, at the same time, serving a number of very useful functions. We are certainly in the minority, especially those of us who have chosen "other" machines. Once again, we are reminded of the function and usefulness of the user group and the need for users to band together. SUPPORT YOUR USER GROUP!

Presidential Ponderings—June 1991

It should come as no surprise that education in the United States is on shaky ground. The deplorable state of our educational systems is the topic of numerous interviews and debates.

The topic appears on TV, on the radio, in magazines and in newspapers. Many of our high school graduates, barely able to read, are joining a community with already a large percentage of functional illiterates. A recent survey showed only 46% of high school seniors can solve problems involving fractions, decimals and percentages and only 5% are ready for college math! The majority of college graduate students in science and engineering are foreigners, most, of whom, return home after their studies.

How long can we, as a nation, remain a world leader if our population, as a whole, is becoming so academically weak?

Most everyone recognizes the problem, but there are vast differences in how best to solve it. There are those who advocate spending more money. But in my view, "throwing money" at a problem alone does little to solve it. Much more important to the solution is the attitude and value system of those involved. And that does not mean JUST the teachers. Parents and their families play a key role in the success of any educational system.

So, what does that have to do with computer user groups? Could it be that helping correct this problem should be a mandate of every user group? Yes, I know that originally the user group was formed to provide a source of information for home computer users. This is still a valid and primary purpose of a user group.

But, think of what we of the computer community could do by encouraging young people (and those not so young) to become involved in a computer user group. The spin-off benefits are practically endless.

Becoming computer literate is the first thing that comes to mind. But, along the way, the active user group member will (can) learn many ancillary skills. Among them are logical thinking, programming, math, music, art, video work, desktop publishing, English (and other languages) and writing and speaking skills.

If the member becomes an officer or otherwise gets involved in the administration of the group, he or she will gain organizational and management skills and possibly even political skills if they undertake to persuade other users to participate in group activities. This is difficult enough even if one is working with paid employees! But with volunteers, it provides a REAL challenge!

Yes, there are numerous benefits from working with computers, especially if one is an active member of a user group. Young folks who are aware enough to know that the rewards of this life are largely dependent upon their education and skills, and especially their parents, whom we trust are dedicated to providing the best for their offspring, would be wise to actively participate in a user group.

We, who are active members, would do well to encourage participation. We would be benefiting not only the individual user and ourselves, but we could take justifiable pride in our contribution, even in a small way, to elevating the educational status of the nation. And, to top it all off, it's FUN!!

Atari Clubs of Denver

Atari Club of Denver Minutes - May 7, 1991

Paul started the meeting with a demo of Print Power. This program has been available for some time, but it was new to some of the members. Paul showed almost every feature short of printing out his creation. Print Power is still available from Horizon Computers and some Mail Order houses.

Larry showed a utility written by Tom Hunt called Snapshot. Snapshot enables an 8-bit machine of 128K or larger to have two programs in memory at the same time. Each program is run independent of the other. Although both programs can't be running at the same time the user can switch from one to the other in less than four seconds. This interesting utility has some great possibilities.

Mike announced ICD is having a sale on most of their 8-bit products. The sale prices are available only through their BBS. Anyone interested in ordering something should contact one of the club officers.

Mike showed us a File Information Data disk with almost all of the game section of the Starfleet library cataloged on it. He demonstrated the speed of the search feature by searching 168 records in under three seconds. As soon as we work out the details, the Atari Club will start cataloging its library too.

Starfleet Meeting Minutes

by Thomas Oughton, February 8, 1991

Officers present: Guenther, Oughton

The meeting started with a total of 7 members present. Anyone who wants to attend our meeting, please call an officer for our summer meeting location. Chris, our president and librarian, has been cataloging our library. This month he demonstrated a new games disk added to the library. The disk includes classic games like Wumpus, Bowling and Ski. Other games are Oilwell, Acrobat, Roto and Star Attack.

Wumpus is a basic game where the player is in a cave and is hunting a cave dwelling animal called a Wumpus. A Wumpus is very heavy so "super-bats" that live in the cave can't lift it. It has suction feet so it can cling to the side of a pit. It spends most of it's time sleeping, but wakes when it hears an arrow. The hazards in the cave are the fore-mentioned "super-bats"; that carry the player to unexplored parts of the cave; and the bottomless pits; where the player falls to his death.

Bowling is a simple Basic game where the computer is the bowling alley. It even keeps score. Ski is a game where you try to avoid trees and other things while sking down a mountain. Acrobat is a game where a man is running along and must jump over or duck under things placed in his way. In Oilwell, you get to buy and sell oil wells. Once an oil well is bought, you can drill the well to produce oil. Taxes are charged on the amount of oil a well produces. It you make enough money, you can be the next J.R.

Roto is a machine language game that has a one man helicopter flying in a cave. By shooting the walls he can enter other parts of the cave. His object is to find all these glowing fuel cell like things and return them to his base. Star Attack is also a binary game. The player must avoid stars bouncing around a room or box.

I demonstrated Jukebox a program from STart magazine. It plays A.M.P. files without all the keystrokes needed by A.M.P. to play a file.

Family Finances is an Atari program that allows the recording of expenses and income for an entire year. It can be used to then budget the expenses for the next year. While written back in the early 1980's, it is still very usable and is still available.

Mike demonstrated Snapshot, a program written by Tom Hunt. This program allows a 128k or larger memory XE compatible to switch between two 48k programs while running them. This for example, allows an author to play a game then, while still playing, switch to a word processor and write the review on it. While not a true multitasking system it is as close as an eight bit can get.

The meeting broke up at 10:00 p.m.

ACCEPT

Atari Computer Club of El Paso, Texas

A very nice meeting, unless you let me carry any of your equipment. Thanks to Paul, Wendell, Pete and Mark for bringing systems to the meeting. Paul did a nice demo of the Macintosh game "Life or Death" in which you are an actual surgeon trying your best to save someone from certain death. Although Paul demoed the Mac version, the game is also available for the ST, but you must get it from Europe.

The new AtariUser was handed out to everyone. All people seem impressed with this new offering. I don't think anyone will complain about the $6 they charge us each month.

We have had responses from 45 people to our free membership offer. Two have actually joined. I would also like to welcome back to the club Joann Anderson. Ben Tice also has become a new member. Welcome both!

I destroyed Paul's keyboard. (Actually just the down cursor) and I apologize again. See, trust the prez to do something...We had several of the European mags on display today, and a lot of people took a look at what we are missing by living in the US.

Next month, our meeting time is changed to 3:00pm. PLEASE NOTE THE TIME CHANGE. Also, next month is our auction, so if you have something to sell or trade, this is the place to do it.

Well, that is all for now. Thanks to all who have given money for the upgrade, it should be in soon. Also, thanks to Wendell for doing a fine job with the library. Thank you Pete for scanning the new club logo. Thanks to Angela Holt for designing the new club logo. Keep bringing those computers! Until next month...Tim

ACCESS

Atari Computer Club

Encompassing Suburban Sacramento

For those of you who don't know who we are, ACCESS is the Atari Computer Club Encompassing Suburban Sacramento (California). We are proud to be an EXCLUSIVELY 8-BIT user group, carrying on the 400/800/XL/XE tradition. If you have trouble finding software for your 8-Bit, check out our Disk Library and the ACCESS BBS. We provide help and information to the local Atari community. In addition to AIM, our members receive "The ACCESS Key", our local newsletter.

We offer a number of meetings each month to give you more information on your computer and to answer your questions. And of course, we are anxious for you to share what YOU know, since there always seems to be something new and fascinating in the Atari world.

Our GENERAL MEETING is at 7:30 pm on the first Wednesday of each month in Classroom B of the S.M.U.D. training building at 1708 59th Street, between Folson Blvd and R Street, just off Highway 50. This is our main get-together.

Other monthly meetings are held on the following three consecutive TUESDAY nights at the homes of Barry Gordon (Modem SIG), Bob Drews (Board of Directors Meeting), and Tim Naber (Disk SIG). Telephone them for additional details. We hope you can be part of these groups.

Our meetings are very informal and lots of fun. The format is called RANDOM ACCESS, meaning it's up to you to bring something to share--a new program you might be working on or an old favorite that you want to show off. There will be a sign-up sheet at the door.

We will start with a "question and answer" session, so be sure to write down specific questions or technical problems you might have. During this session we won't go into detailed answers, but we will point you to someone who is likely to know the answer, and then you can get together with him (usually Barry Gordon!) during the later part of the evening, after any demos or presentations, when all pretense of organization is dropped and we gravitate into informal groups and "catch as catch can."

During the past few months, for example, we have been treated to: Michael Stomp (our most often published writer) on programming; Bob Haynes with his "works in progress" (Big Font, Son of Big Font, and Illegitimate Son of Big Font!); former ACCESS president Mark O'Connell with the very popular "Antic Music Processor"; Jim Dysle (our other prolific writer) with a mind-boggling, humorous "Acrosstix" (how do you spell that???); and not the least of all, our hardware experts, Tim Naber & Barry Gordon with everything from the Black Box and MIO's to 1-Meg upgrades, hard drives and SynFile.

We're comfortable with a "laid back" kind of club: casual, informal, just friends getting together on a monthly basis to share what we know or to learn from what somebody else is sharing. It's a great group. We have alot of fun at the meetings. If you are reading this and are not a member, come on and join us. We hope to be a group "where everybody knows your name."

Anyway, we hope to be in touch with you other 8-Bit user groups. Why not drop us a line -- electronically on the ACCESS BBS (916-428-8662) or "the old fashioned way" (at PO Box 1354, Sacramento, CA 95812-1354).

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

Notes from the June 1 Meeting.

The topic for the meeting was telecommunications. Kim Stahn had just received the new US Robotics 9600 baud dual-standard modem for the BBS and he had it with him. (It has since been installed and is up and running on the BBS.) Our FNet node number will be 678 but Kim and the Sysops are still getting things set up for us to be an FNet node.

Scott Sorg demonstrated a couple of inexpensive approaches to modem use with the ST. Vanterm 3.8 is a shareware telecom program that has many features that make it easy to use. Vanterm was written in GFA Basic. Scott also demonstrated how the VT-52 emulator that comes with the ST can be used as an accessory which along with another accessory like Transfer 1.2 to make maximum use of a 512K, single-floppy system. An ST was set up with Forem to act as the BBS for the demonstrations. An XE running Express! was also demonstrated.

Mike Surface demonstrated Lemmings on the ST. Adam Kelley demonstrated the ST version of the Lynx game Chip's Challenge.

Notes from the Officer's Meeting

The July, August, and September meetings will be held at the Shawnee branch library on the first Saturday each month starting at 10 AM. Final preparation for our Three Rivers Festival event is being made. Plans are for the joint ACORN/IEEE meeting to have emulators as the main topic.

ATARI FEDERATION

Secretary's report: June's meeting was started with a demo of AIM's new 8-bit disk-of-the-month. Looks pretty good. Phil brought in the club's new 1040STe. The club librarians are maintaining the club computers. Discussions started with the Glendale Atari Show, we will not be having a booth this year, but some of our members may assist in show activities. There is a new release of ST Writer Elite, it's on Sonny's BBS for those interested. The latest Calamus update is modular. Word also has it that the Stacey was canceled. However, the Atari Notebook is due out 'soon'. Following the regular meeting, several people got a chance to try out the new 1040STe. Next club meetings are: Jul. 1st, Aug. 5th, and Sep. 2nd. See you there, and don't forget to renew your memberships!

BRAG ST

Buffalo Region Atari Group for ST's

The May 16, 1991 BRAG ST meeting was opened by Chairman Mark Pierro at 7:30 p.m. Due to an error (wrong meeting date and agenda) on the reminder postcards sent to members for the May meeting, there were only 10 members present. We regret any inconvenience this may have caused.

Club business included a discussion about having a fund raiser, but the idea was voted down for the present time. Copies of the ST Connection "Atari Users Coupon Book" were then passed out.

The meeting continued with demonstrations of Informer 2 (an excellent data base program with the ability to integrate graphics with data) by Gerry Genson and Hard Driving by Mark. Because of the low attendance it was decided to save the raffling of Hard Driving for the next general meeting. As usual, Carl Barron was busy selling the AIM disk of the month.

See you all at the next meeting.

C.O.A.C.

Central Oregon Atari Club

Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986

Our own Mr Aaron Leis is gittin' married to Miss Charah Celeste Starr. The wedding took place the 29th of June at the Village Green in Sisters Oregon. Our congratulations and best wishes to you, Aaron and Celeste.

Everyone, remember we receive PD software monthly. Much of it quite good and useful. We have utilities, graphics, and games. We have recieved some DeskJet and hard drive utilities that some of you may be very interested in. One of the HD utilities allows you to turn your system on all at once. The utility awakens and waits for those SCSI drives that require you to do a double boot. It's Shareware ($5.00) that makes life with you HD much nicer. There are envelope and sheet label print utilities, screen dumps, and down loadable fonts for your Desk Jet. Come to the meetings and pick some up. Oh, by the way, it would be handy if you would pre-format your disks. That way we don't have to waist the time formatting we can get right to copying.

HACE

ANNOUNCEMENT !!!!

HACE has confirmed its plans for the 1991 **ATARI SAFARI** to be held in Houston on Saturday, 28 September 1991. Times will be from 11:00AM til 5:00PM. *Everyone is welcome!* For details call the officers of HACE or call 915 855-0815 (evenings). A dealers package is about ready and will be mailed out in June or early July. Bob Brodie has indicated that he wants to come to Houston and that he did not want to miss the ATARI SAFARI. Everyone make your plans to make this *Houston Event*. The location is at the Holiday Inn @ I-10 and Silber. The meeting space is three times larger than last year's space, so this is going to be the largest ever Atari event in Houston. Y'all come!

Middle Georgia Atari Users Group

M.G.A.U.G.

JUNE MEETING

The June meeting was a little smaller than usual. Discussions were held on the state of Atari and new developments. One discussion was about whether Atari's move to production in Israel was wise. Although Atari will be cutting transportation cost for its main export (Europe) there will be substantially higher labor costs in Israel.

Lee Benjamin brought his computer to the meeting with a new and unorthodox adaptation for the Atari -- n IBM power supply adopted for use with the ST. Seems that Lee's power supply in his ST died last month and while looking for a low cost alternative he noticed that many IBM power supplies have the same outputs as the ST. A little rewiring and the IBM power supply was hooked up without a hitch. Although the set up was not very good looking there is an added bonus of using low cost IBM power supplies which in many cases sell for $40 or less.

Plans for our annual show on October 5 are going ahead so be sure to sign up to participate. As stated earlier we will have the IBM, and Amiga users groups will attend also for a big gala event.

Thats about it for this month. Don't forget the next meeting.

P3Atari Computer Enthusiasts (P3ACE)

The Prez Sez by Rick Reaser

It's hard to believe it, but summer is already here and it's time for our annual picnic. The plan is to have it at the same place as last year, Black Forest Regional Park, with the same general plan-- bring your own meat and the club provides everything else. We will be sending out a separate flyer with the details by direct mail. Since the park has electricity, we will also have a few computers in the pavillion as well.

Mailbag—We have a nice library of catalogs from many Atari vendors. Several catalogs are really worth seeing. Best Electronics and B&C ComputerVisions both have new catalogs with excellent product selection, pictures and graphics. The latest German club 8-bit disk has stuff that will knock your socks off (so will the stamp that mailed it). Of course we continue to receive PSAN and Current Notes. We are also getting the new AtariUser magazine as well ST Connection. The ST Connection sent us a bunch of coupon books that were passed out at a recent ST SIG meeting. We got a nice letter from Jim Cox, who is still in Germany, but at a different location. Jim renewed his dues so that P3ACE membership will continue to span the globe. Nick Christopolous, our Wyoming member also wrote and is having trouble winning at some of his games. Looks like STart is no more. At least we still have AIM.

The April 8-bit SIG was game night. We played One-on-One, Mario Brothers and a whole lot of other things. Fun was had by all. We looked at educational software in June. There were a number of picks and a lot of pans. The watchword is to ask someone else, before you buy any educational software. There are some real dogs out there. The July meeting will be a swap meet. We are doing heavy advertising on it with the GT, Base paper, CableVision and a post card to each member. Someone donated an entire 8-bit system to the club which we well sell cheap at the swap meet. ICD is selling out all their 8-bit stuff direct to anyone. We are going to "double" the donated 1050 disk drive and keep it, but sell the club's Percom drive. The ICD sale is pretty good, so if you ever wanted anything from ICD (P:R: connection, SpartaDOS, R-Time, Rambo XL, US Doubler, Toolkit, etc) now is the time to get it, cheap!! We are also signing up to get AIM's 8-bit Disk of the Month. More 8-bitters need to start coming to the SIG, so that Roger Meston doesn't keep winning the door prize.

The STsters have been up to their usual antics. In April, Bob Vixie demoed his ICD AdSpeed. Slick!!! Not only that, he explained how the AdSpeed worked. Slicker!!! Bob also had several other "industrial strength, home made" boxes hooked up to his highly modified 520 ST with 1Meg and Rainbow TOS. Sam Cherry, the accesory and public domain software king, showed us Video Eyes. He severely jeopardized his 1040's memory chips by scanning yours truly's happy mug as a part of the demo. May was a swap meet for the ST SIG. (I wonder where the 8-bitters got the idea to do their swap meet?)

On a sad note, Dave Koster is now in Ohio getting his Masters Degree in Space Stuff. We will really miss Dave in P3ACE. He was always ready to help and go that extra mile for the club or anyone for that matter. He was a true Atarian's friend. But wait, he's not dead yet. Maybe he will get reassigned here to the Springs. We can only hope. In the meantime, I will need to find someone else to call when I don't know what to do.

See you at the next SIG meeting.

PORTS ATARI

P.A.C.E.

COMPUTER ENTHUSIASTS

Summer's here, and as I've been told, interest in computing declines markedly. I don't know about the rest of you, but I have been logging an enormous amount of time on my ST. I've fully organized PACE's ST Disk Library and that should be to everyone's benefit. Working around system crashes with Word Up is enough to drive one insane. How could such a program be sold for money? Maybe it was written to run on an Amiga and went through a sour translation. Nonetheless, my MIDI programs run supurbly. Next project is to upgrade the STe to 4 megabytes and try to locate Atari's "Midi-Tasking" software. I've been searching for some software that will "show off" my STe's sound and graphics. If anyone hears of such a program, let me know.

By now we should be receiving our 8-bit DOM from AIM. Hope the disk contains some of those fabulous European programs we have all been hearing about. I'm sure each disk will contain a good mix like the ST AIM DOM's. I have read that the 65/130XE continue to ship to many parts of the world, including the US. Atari is supporting the machine the best way possible, but support for the 8-bit in the US is declining sharply. My 800XL is still used many times during the week. Aaron's favorite games? Challenging the computer in Archon, flying with Blue Max and Ace of Aces! Keeps his trigger finger finely tuned.

Our summer meeting respit is half over. However, like previous years, we always seem to get together once in the summer to talk 'tari. Think of summer as an opportunity to familiarize yourself with fellow members on a more personal basis.

PACE loves their AIM DOM's!!! Those of us who don't have access to either modems or the commercial BBS's have become reliant on those disks as a source of excellent software. The magazine isn't bad, either! Again, our club is in excellent financial shape and is continuing to "run itself."

I've received an alarming number of telephone calls lately involving the sale of used Atari equipment. One caller with a huge ST assortment joined the IBM league and was hoping we would purchase his equipment for our club. Another call was from a real 8-Bit power user who bought an IBM clone and needed to sell his gear. More and more Atari users are defecting in favor of "Big Blue" and nothing I say will stop it. Just about every major retailer has IBM clones for sale and prices are coming down monthly. Most of us agree if there were only one retail outlet that sold Atari's in this area, people could at least compare machines and make an educated decision what computer to buy. On the positive side, there's bound to be an enormous amount of Atari gear in the local want-ads, so keep an eye open for some good deals.

Our ST-PD disk library is ready and by now, everyone should have our catalog on disk. It is chock-full of useful programs along with the PD library. The disk also features GoGo-ST as the menu driver. Out of town members should have received their disk by mail. The 8-Bit AIM Disk arrived and has a varied mix for everyone. I admit I was a bit rusty unarc'ing the disk, but after the first one, it was easy. It's been a long time since we've had anything new to offer our 8-Bit users and this disk fits the bill perfectly. We'll have a lot of catching up to do at next month's meeting, so be prepared to wait in line for your free ST / 8-Bit DOM's. See you next month in AIM!

Club Minutes–Meeting on 06/08/91 by Wayne Myers

Well, with this meeting our club meetings now begin at 10:00am in the morning so the rest of the day wouldn't seem so short. Unfortunately, some failed communications brought some members at the 12:00pm time.

During the meeting we had demonstrations of two programs, Shufflepuck Cafe and ST Writer Elite V. 4.1.

Shufflepuck Cafe is a game by Broderbund in which you play a futuristic air hockey player and find your way in to a bar with some alien hockey players which want you to play a game or two or more of shufflepuck. Shufflepuck itself is very similar to pong, you basically knock a puck with your paddle to your opponent and then your opponent returns it to you, and back and forth until someone fails to return it. Each opponent you face has their own personality and special ability in shufflepuck, so you need to develop different strategies against each one of them. As well there are various options to modify the paddle size, speed of puck and other things.

ST Writer Elite is a word processor which started out as the ST's 16 bit Atariwriter program, but Atari dropped its rights and it became public domain. With that a fine programmer modified it and it became what it is today, a free word processor for all to use at no cost. The actual word processor covers most command used by word processors, as well it can convert Atariwriter files to ST Writer files.

R.A.C.E.

Well gang, it's been a while since we've talked but since we missed the last issue, there's a little bit of catching up to do. First of all, I'd like to announce the new officers to all of you who missed the May meeting.

I was concerned that no one would want to step up and help with the club and I was really thinking that the club may come to an end. But I was proven wrong. As of now the officers for R.A.C.E. are as follows:

President -	Lewis Midyette -	828-4319
Vice President -	Eric Schofield -	851-5134
Secretary -	Don Nelson -	942-2764
ST Treasurer -	Tony Manino -	851-8092
8-bit Treasurer -	Arthur Katz -	881-0247
BBS SYSOP -	Robert Yates -	552-7053

If you have any problems, please call. We're here to help you.

The club BBS is now up and running and activity on the board is very low right now! We need to change this. We all have been griping about getting a BBS and now that we have one, no one ever calls it. We need EVERYONE to call and upload their favorite Atari software to it (no copyrighted software please!) whether it is 8-bit or ST software. Let's get involved gang, send email, send fmail, start messages, DO SOMETHING! The name of the club BBS is the Galaxy BBS and the number is 552-0974.

The club is now receiving AtariUser magazine each month. You can pick up your FREE copy simply by coming the the meeting. The mags will be distributed there. It has a color cover and the articles inside the magazine are excellent. It has easily become one of my favorite magazines on the Atari market.

July's meeting will be held at the Richard B. Harrison Library at 7p.m. on Tuesday, the 23rd. We will be discussing telecommunications and hopefully we can work something out where we can hook up to the club BBS and GEnie while we're there. We'll show you a couple different terminal programs and show you what some of the telecommunication services have to offer. We'll see you at the next meeting and don't forget to call us if you have any questions!

SCAT SUBURBAN CHICAGO ATARIANS

AN INDEPENDENT COMPUTER USERS GROUP

President's Comments:

This column contains information to our members who have not attended our past meetings. Because of AIM missing an issue and our problems with meeting at College of DuPage some of our members are unaware of changes made at the last meeting. COD is starting to charge for meeting on the weekend at a rate of 10 dollars an Hour. Therefore, the following will take place. The July meeting will be on the 20th of July. There will not be any August meeting. Starting in September the meeting will be on the first saturday of the month. This change will be permanent. The ST Sig will be canceled until Mike Riley can get together a group to restart the meetings. This change was the best the club could arrange at the present time. It also will mean our treasury could get tight in January next year.

SCAT has scheduled the following demo's at the general meetings.

July 20. Al Conley will attempt to get an 8bit Atari to talk to a ST with the use of a null cable. Room K157

August NO MEETING

September 7 Desk top publishing programs Timeworks Publisher ST and PageStream Version 1.82 will be compared. Room K157

October 5 A Hewlett Packard Laser IIP and deskjet 500 will be compared.

San Diego Atari Computer Enthusiasts

SDACE has been busily arranging for speakers to address our monthly general meetings and it looks as if we have a couple of good ones coming up. At our May 20th meeting, we had Mr. Todd Bane demonstrating ST Informer II database system. At our June meeting, we hope to have a demonstration of ST Tracker although that was not confirmed by press time. For upcoming subjects that will occur after this goes to print, at our workshop meeting Thursday, August 1, we will have our second Atari Swapmeet. Don't miss this event! We hope to press on with more demonstrations including TT's, ICD's ADSPEED accelerator, and more! Come join us at our general or workshop meetings, everyone is welcome.

For those of you who just joined us, SDACE is still alive and well and continuing to hover around 100 members. That makes us a significant Atari market and we want to make sure other folks know it. Why might you ask? Because our size has aided us in our ability to get some good Atari product demonstrations for the group, and some great software discounts to boot!

In May, we had a demonstration of ST Informer II, a semi-relational database program, by Mr. Todd Bane of Soft-Aware Inc. After the meeting, we managed to get a special discount on the latest release of the program and 5 happy members picked up a copy. While we're all not in the process of itemizing our workplace or household, the power of the program and ease of use make this an ideal database for all but the most demanding of users. Thank you Soft-Aware!

In another coup for the group, Vladimir Vooss, our Secretary/Newsletter Editor, managed to work another deal on ST Tracker. With a demo version to be shown at the June meeting, and a big discount to club members, we're rounding out the software inventories of our group.

We've had some changes in our group - Dennis Kay has taken over the monumental job of maintaining SDACE's public domain disk library with hundreds of disks to be catalog'd and updated. Terry Scott, our 8-bit coordinator has moved out of the area and had to turn the reins over to Tom Smith. We'll miss Terry, he brought a tremendous revitalization to the 8-bit group.

Our August workshop meeting, scheduled for Thursday, August 1st, is rapidly approaching, bringing with it our second SDACE swapmeet of the year. The response to the first one was exceptional, but this next one should easily eclipse it. I'm dusting off my unused software and hardware in preparation for this event. It is coming just in time to help me get in the mood for the September Glendale, Ca Atari show put on by the HACKS group. This event is the big Atari event for all of southern California. Hope to see you there!

SEVAC

SEVAC Report for 4-20

Treasury Report $650

We have a 520st and are upgrading it with the jri simm board to 2 meg and starting an ST BBS. We got an 85 meg harddrive for $275. No date yet for its operational start. Phone number will be 833-9216.

1040STE $400 drop from $699. Branch Always discount through club for 5 or more orders. Practical Solutions is out of business. Our meetings are now at the Dobson Library in Mesa.

SEVAC Report for 5-18

Treasury Report $293

Wire schematic for Microsoft mouse on ST. STart is not publishing any more. Jim Allen's new T20 (68020) board upgrades for $329.

June 15, Hardware Day...Bring Your Favorite to Show.
July 20, Applications Day...Bring Your Favorite to Show.
Aug 17, Audio/Video Day...Bring Your Favorite to Show.
Sept 15, Emulation Day...Bring Your Favorite to Show.
Oct 20, Telecomm Day...Bring Your Favorite to Show.

SLICCTOP

The most powerful desktop available!

And still at the unbelievable price of only . . . $49.95

(Requires a hard drive and at least 1 meg of memory)

MULTITASKING DESKTOP

ACCESS FROM GEM PROGRAMS
UNIQUE QUICK ACCESS MENU (Holds up to 144 programs / data files)
CONCURRENT PROCESSING
UNLIMITTED WINDOWS
HOT KEY CAPABILITY
CUSTOMIZED ICONS
ONLINE HELP

Summer Brings New Desktop Applications

By Randy Foster
President of SLICCWARE

SLICCWARE is pleased to announce the introduction of a series of applications written specifically for the SLICCTOP multitasking desktop. The first application, the SLICCTOP text editor will be made available to registered owners the beginning of July, 1991; and will also sell for $49.95.

August will bring the release of a powerful word processor, SLICCWORD , which will also be made available only to registered owners. Both the word processor and the text editor will run directly on the desktop and make use of the multitasking, unlimitted windows, and transparent data sharing capabilities found only in SLICCTOP !

Additionally, a terminal emulator and various five'n-dime software modules for interfacing modem hardware and performing file transfers using standard protocols, are planned to be released before summer's end.

Most importantly, SLICCTOP will not increase in price until autumn, when it will undergo a substantial increase in price to reflect its capabilities as an operating system.

Until then, it remains at an unbelievable price of only: $49.95

To order directly, send $49.95 (check or money order payable to SLICCWARE) to:
SLICCTOP, P.O. Box 2609, Kirkland, WA 98083 Or call: (206) 867 - 1786.

EdHak

2.1 is here!

SAG Saginaw / Tri-City Atari User Group

"where the deer and Atarians play"

IMPORTANT NOTICE: NO MEETINGS IN JULY AND AUGUST!!!! OFF FOR THE SUMMER. HAVE A SAFE AND FUN SUMMER.

At the MAY MEETING:

At the May meeting, we discussed the happenings at the Atari show in Ontario, Canada. Two of our members attended the show and enjoyed the seminars, dealers, and discussions with fellow Atarians. Bryant LaFreniere demoed the stuff that he bought from Codehead Software. The major program of interest was the CODEKEYS program. This program can remember keystrokes, mouse clicks, and other movements. With this ability, macros can be created for any of your Atari programs. The ability to edit these instructions makes this program the ultimate macro creation program for the ST.

At the JUNE MEETING:

At the June meeting, we discussed the information recently received from AIM. The new format for sending information to the club within a month of a meeting was our goal in the beginning. I hope that it works out for them and us. We will register for the AIM disk for the ST and 8-bit for the following year. We will not participate in the community fair during the July 4th weekend at Fashion Square Mall. Doing two shows is too much for our small club and we will concentrate on participating in the January show next year.

Marty demoed dbMan, the most sophicated database for the Atari ST. DbMan is compatible with that other computer's (IBM) popular database, DBASE. The ability to create your own desktop menu allows you to customize your databases. The self-creating and editable programming language gives you the flexibility to do whatever you want in formatting, printing, and search capabilities. We were very impresssed on the possible uses of the dbMan database program.

In SEPTEMBER:

NO MEETINGS IN JULY AND AUGUST!!!!

At the September 14th meeting, we will hopefully look at WORDFLAIR II for the ST. The newest GDOS, FSM GDOS, should be out and a demonstration of it with WORDFLAIR will show you the power of ultimate word processing. Bryant LaFreniere and Darryl Ziegler will show you these programs and will be the equipment volunteers. Also, The premier issue of the AtariUser magazine SHOULD be there (if Steve gets it to us). A free copy will be given to all who comes to this September meeting.

May Meeting Minutes

The May meeting of WAUG was held on Tuesday, 5/14, in the Anderson Room of the Michigan Union. President Craig Harvey called the meeting to order at 7:30pm, keeping his campaign promise good to the last drop! Craig distributed a survey polling the members on ideas concerning the club's future.

The video of the AtariFest we had hoped to show was not available, so it looks as if we'll be watching that next month instead. There was some discussion about the show for the sake of those who had not attended, and copies of the show brochure were made available. By most accounts the show was highly successful and, although the attendance levels were somewhat disappointing, most of the vendors have indicated in the online networks that their sales levels were good and both the WAUG clubs were happy to note they did not report any red ink when all was said and done.

Craig detailed coming events: June will be the annual officer elections/flea market. July will feature a twist from the normal general meetings, we'll be meeting at Uno's pizzeria instead of the Union where the club will spring for 'za for the members in a sort of Post-AtariFest- Extravaganza-For-No-Good-Reason.

Bruce Urbanski started the discussion of the feature topic (high speed modems) showing his U.S. Robotics HST and describing some of its features. Bruce was happy to tell us that the USR proprietary protocol has allowed him to experience throughput exceeding 14,000 bits per second. Bruce was followed by Victor Volkman, sysop of the local HAL9000 BBS. Victor held the room in near silence as he described the history and status of current CCITT standards, modems and protocols, and the Hayes hardware he uses.

Bill Rayl demonstrated and/or described most of the titles on this month's AIM disks, both 8-bit and ST. The latest picture display programs for the XL were truly astounding! Russ Crum followed Bill with a treasury/membership report.

The meeting was adjourned as Bob Retelle showed prints of pictures he took at the show, with Bill merrily chugging away making up copies of disks from the club library.

June Meeting Minutes

The June meeting of WAUG was held on 6/11 in the Anderson Room of the Michigan Union. Craig called the meeting to order at 7:30, depending on whose watch you were looking at, and announced this was to be the annual officer election night.

Preceding election activities, Craig read the list of job descriptions from the Charter. With the formalities out of the way, the fun started. It is noteworthy to mention that MOST of the positions had more than one nominee in contention! And the winners (?) are:

David Brzezinski, President
Craig Harvey, Vice President
Dan Cable, Secretary
Russ Crum, Treasurer
Bob Retelle, Editor
Mike Olin, ST Librarian
Dick Selke, 8-bit Librarian

Congratulations all!

Following the elections, Craig reviewed the results of the survey taken last month. It was decided to update our old and outdated demo equipment, along with an increase in door prize activities.

Dave B. described a brainstorm he's been working on concerning future Atari shows and a way to promote user groups amongst Atari computer owners. While this is still in the thought stages, ideas will be considered during future officer and general meetings.

Craig announced that the show video is still not available for viewing. Apparently the producer has been having some equipment problems which should be rectified any day now. Plans for the July general meeting, however, will make it impossible to view the tape at that time so we will probably now postpone it until the August meeting.

The July meeting will be a pizza party, a "good job" gesture in recognition of the excellent work and support that went into planning and execution of the AtariFest. Members will meet at Uno's pizzeria (South University, near Forest) at 7:30. The August meeting plans are a bit fuzzy at this point. We will either take a guided tour of a TT or demonstrate the assembly of a hard drive system for the ST and 8-bit systems.

A-T-A-R-I

ANSWERS, TIPS AND RELEVANT INFORMATION

CREATIVE PROGRAMING USING ATARI BASIC'S IMMEDIATE MODE

Paul V. Alhart (AFED)

What is the Immediate Mode? Just type in a command, *with no line number*, and press RETURN. The command will execute *immediately* without disturbing any program or data you currently have in memory. Try this from BASIC:

```
FOR I=1 TO 255: POKE 710,I:
NEXT I: POKE 710,144[RETURN]
```

As you can see, more than one command can be placed on a line, just as in any BASIC program line. There are some obvious limitations though. You have to type in the commands each time you want to use them, and you can only type in as much as will fit on one "logical" line (120 characters max).

So where does the creative programming come in? Type in the above example again, only precede it with a line number before pressing RETURN. Notice that this time it didn't execute when you pressed RETURN.

The line number tells the computer the command is a Program Mode Command and should execute only after you issue a RUN command. Now give this one line program a name and LIST it to disk (for example, LIST"D: TEST").

Using a word processor, load this one line program and edit away the line number. Resave it to disk using the ASCII Save option, and you now have a disk-based program that will RUN in Immediate Mode when ENTERed from disk (using the above example, ENTER"D:TEST").

Now you can get creative. Your Immediate Mode programs are no longer limited to one "logical" line. They don't have to be retyped each time you want to use them. They will not interfere with programs or data residing in memory!

Most BASIC commands can be used, including DIMension, Open & Close, GET & PUT, IF & THEN. Commands that reference a line number—like GOTO or GOSUB—cannot be used within an Immediate Mode program. But, GOTO can be used as an exit to a program line that is in memory.

Immediate Mode programs can call other disk-based programs. BASIC programs can call Immediate Mode programs and use them as disk-based subroutines. End your Immediate Mode program with a RUN or GOTO command and a program in memory can be automatically restarted when your Immediate Mode program finishes.

Some uses for disk-based Immediate Mode programs could be for utility programs. I have written several Immediate Mode programs which I keep handy on my BASIC Programming utility disk. They allow me to look up an ERROR number, convert numbers between hexadecimal and decimal, look at disk directories, Lock/Unlock/Delete files and more....

All without ever leaving BASIC or the program I am working on! You may remember seeing some of these in my Atari BASIC Enhancements article that appeared in the May '89 issue of Antic.

Now it's your turn to get creative. Write an Immediate Mode program or utility of your own. You will find that writing a program that does not reference any line numbers can be quite a challenge.

Be sure to LIST it to disk and edit out the line numbers after you have it debugged and RUNning. Feel free to send me a copy of the fruits of your labors. I would love to see what other 8-bitters are doing.

Also, with your permission, I will share your efforts with my readers in future A-T-A-R-I columns or possibly on an AIM 8-bit DOM.

Hi-Tech ATARI 8-Bit!

BRAND NEW ITEMS

$\$169^{95}$/ $\$199^{95}$ THE "SUPER E-BURNER!" $\$169^{95}$/ $\$199^{95}$

The Super E-Burner is a **PROM/EPROM** copying/programing device that plugs into your Atari's cartridge port. It is the **FASTEST**, most versatile Eprom programmer ever devised for Atari. It will program all Eprom sizes from 2732's through 1 Meg! Its speed is incredible. It can program a 27128 and double verify its contents in 15 seconds! It is a software driven device which allows the user to **READ** and/or **PROGRAM** proms/eproms and save their contents to disk or hard drive. Only $169.95 plus $8 S/H/I. Mini **GANG BURNER** which is the same as above but will burn two eproms at a time is only $199.95 plus $8 S/H/I.

$\$49^{95}$ "HARD DRIVE PRO BACKUP!" $\$49^{95}$

A truly useful utility for anyone owning a Hard Drive. It is the simplest, fastest, most versatile HD backup program ever offered for Atari 8 bit computers! It will allow you to stream your data to floppys (up to 8 destination drives!), other HD's, and is VCR compatible if and when our VCR backup interface becomes available!

- **SUPER FAST**
- **AUTOMATIC COMPRESSION** to save disk space
- Allows saving to 8 **DESTINATION** drives!
- Allows saving to another HD
- VCR backup compatible
- Restores individual directories
- Works with **MYDOS** or **SPARTA**
- Will save to **80 TRACK** drives
- Backs up by **ARCHIVE**, by **DATE**, or by selected **DIRECTORY/SUBDIRECTORY**
- Supports **ULTRA HIGH SPEED** disk I/O to capable floppy drives
- Allows **PRINTER DUMP** of all pertinent information

Only $49.95 plus $5 S/H/I.

$\$99^{95}$/ $\$139^{95}$ "XF551 3.5" CONVERSION!" $\$99^{95}$/ $\$139^{95}$

The **XF551 3.5" CONVERSION kit** for your XF551 drive will double your storage space (750K per disk!) while allowing you to use the far superior 3.5" disks currently being used by many of the major computer manufacturers. Included with each kit is a high quality **SONY** 3.5" drive, completely mounted in a 5 1/4" faceplate assembly, all cables necessary for a **SOLDERLESS** 2 minute installation, and a completely re-written OS (including some incompatibility problems). This is the best quality conversion of its type! Only $99.95 plus $8 S/H/I. A **DELUXE CONVERSION** which allows the use of the existing 5 1/4" mechanism in your XF551 along with the 3.5" drive is also available. It will allow you to access BOTH mechanisms as two separate drives so copying from 5 1/4" to 3.5" disk or vice-versa is possible even when mixing densities! And its totally **SWITCHLESS!** Just insert your disks and DOS does the rest! Kit contains all features of the standard conversion (above) except that minimal soldering is required. Only $139.95 plus $8 S/H/I.

$\$49^{95}$ "BLACK BOX ENHANCER"!© $\$49^{95}$

A must for all serious **BLACK BOX** owners! This device simply plugs into your **BLACK BOX** and delivers the following features:

- High resolution screen dumping in 16 shades of **GREY!**
- Dramatically improves print quality of **TEXT** or **GRAPHICS!**
- Built in handler will print **CONTROL** and **INVERSE** characters.
- Has built in Hard Drive **TASK MASTER** utility
- Supports **MYDOS** and **SPARTA**
- Supports all densities
- Built in **SECTOR EDITOR** supporting partitions up to 16 meg!
- Displays **DIRECTORIES** and **SUBDIRECTORIES**
- Built in **SECTOR COPIER** utilizes all available memory
- Copies selectable sectors
- Allows editing of **ASCII**
- **SEARCH** by string (**ASCII** or **HEX**)
- Automatic **HEX/DEC** toggle
- Built in **DISASSEMBLER**
- **EDIT/SEARCH** by 11 or 16 bit links/**SPARTA** sector map/or entire disk

Ideal for repairing blown directories, making on the spot repairs or

REPAIRS

For 24-48 hour repair service on Atari computers or drives, call our repair department at (716) 586-5545 day or night. All work is guaranteed, NO minimum estimate fees; if you have two or more items for repair and don't want to spend any money .... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE ... we'll keep the other defective item for parts!

BEST SELLERS

$\$69^{95}$ SUPER ARCHIVER $\$69^{95}$

The new **SUPER ARCHIVER**, obsoletes all copying devices currently available for the **ATARI 1050**! It eliminates the need for Patches, **PDB** files, Computer Hardware, etc. Copies are exact duplicates of originals and will run on any drive; without exaggeration, the **SUPER ARCHIVER** is the most powerful **PROGRAMMING/COPYING** device available for the 1050! Installation consists of a plug-in chip and 6 simple solder connections. Software included. Features are:

- **TRUE DOUBLE DENSITY**
- **ULTRA-SPEED** read/write
- **FULLY AUTOMATIC COPYING**
- **SUPPORTS EXTRA MEMORY**
- **SCREEN DUMP** to printer
- **TOGGLE HEX/DEC DISPLAY**
- **SECTOR or TRACK TRACING**
- **AUTOMATIC DIAGNOSTICS**
- **DISPLAYS HIDDEN PROTECTION**
- **ADJUSTABLE/CUSTOM SKEWING**
- **AUTOMATIC SPEED COMPENSATION**
- **AUTOMATIC/ PROGRAMMABLE**
- **PHANTOM SECTOR MAKER**
- **ARCHIVER/HAPPY ARCHIVER**
- **COMPATIBLE**
- **BUILT-IN EDITOR**-reads, writes, displays up to 35 sectors/track short
- **BUILT-IN CUSTOM FORMATTER** up to 40 sectors/track
- **BUILT-IN DISASSEMBLER**
- **BUILT-IN MAPPER**-up to 42 sectors/track
- **DISPLAYS/COPIES** Double Density **HEADERS**
- **AUTOMATIC FORMAT LENGTH CORRECTION**
- **SIMPLE INSTALLATION**

$\$99^{95}$ The "SUPER ARCHIVER II"!© $\$99^{95}$

NOW! COPIES all **ENHANCED DENSITY** programs plus retains all of the features of our World Famous **SUPER ARCHIVER**! (see above). Allows you to **COPY** or **CREATE** single or **ENHANCED** density protection schemes (including **PHANTOM SECTORS**!). Completely automatic; compatible with the **BIT-WRITER I**; the **ULTIMATE BACKUP/PROGRAMMING** device! Only $99.95 plus $4 S/H/I. **NOTICE**! If you already own a **SUPER ARCHIVER**!, you can upgrade to a **SUPER ARCHIVER II** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$\$79^{95}$ BIT-WRITER $\$79^{95}$

The Super Archiver "**BIT-WRITER**"! is capable of duplicating even the "uncopyable" EA and SYN series which employ 34 FULL sectors/track. The "**BIT-WRITER**"! is capable of reproducing these and **FUTURE** protection schemes of non-physically damaged disks. Simple installation... **PLUG-IN** circuit board and 4 simple solder connections. The "**SUPER ARCHIVER**" with the "**BIT-WRITER**"! is the ultimate **PROGRAMMING/COPYING** device for Atari 1050's. **EXACT DUPLICATES** of originals are made! Copies run an **ANY** drive. Must be used with Super Archiver. Only $79.95 plus $5 S/H/I.

$\$69^{95}$ ULTRA SPEED PLUS $\$69^{95}$

Imagine a universal XL/XE Operating System so easy to use that anyone can operate it instantly, yet so versatile and powerful that every Hacker, Programmer and Ramdisk owner will wonder how they ever got along without it! Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. Use **ANY DOS** to place an **ULTRA SPEED** format on your disks, boot any drive (1-9) upon power-up, format your **RAMDISK** in Double Density, activate a built-in **400/800 OS** for software compatibility, plus dozens of other features too numerous to mention! Below are just a **FEW** features you'll find in the amazing OS:

- **ULTRA SPEED** SI0 for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from **RAMDISK**
- Special timer circuits not required for 1 or 2 Meg upgrades
- Background colors adjustable
- Reverse use of **OPTION** key
- Cold-start without memory loss
- Built-in floppy/disk configuration editor (1-9)
- Built in **RAMDISK** configuration editor(1-9)
- **RAMDISK** exactly duplicates floppy drive so sector copying and sector editing are now possible
- Built-in MINI Sector Copier
- Toggle **SCREEN OFF** for up to 40% increase of processing speed
- Toggle internal **BASIC**
- Ram resident disk loader program (**MACH10** menu)
- **DOUBLE DENSITY RAMDISK** capable
- Entire **MEMORY** test that pinpoints defective **RAM** chip
- Boot any drive (1-9) upon power-up or cold-start
- Supports memory upgrades up to **TWO MEGABYTES**
- **THREE** Operating Systems in one (**XL/XE, 400/800, ULTRA SPEED PLUS**)

$\$39^{95}$ THE "RICHMANS" $\$39^{95}$

80 Column Word Processor

Easy to use, very **powerful**, and **NO ADDITIONAL HARDWARE** required! Works with TV or Monitor! This "**DISK ONLY**" 80 Column Word-Processor is simple to use while offering numerous features such as:

- Completely Menu driven
- Self contained DOS
- Complete Text formatting
- Built-in Printer Drivers
- Page numbering
- Justify and Endfill
- High speed Cursor
- Spell Checker
- 80 COLUMNS ON THE SCREEN!
- Insert and Delete
- Search Mode
- View only mode
- Memory Statistics
- Alternate Output
- Change screen Colors, borders, luminesce
- Mouse compatible
- XEP-80 Compatible

One expert has compared **40 domestic** and **foreign word-processors and concluded that the RICHMANS 80 Column Word-Processor is the best**! Only $39.95 plus $5 S/H/I. (64K required).

$\$199^{95}$ The "BLACK BOX"!© $\$199^{95}$

The **Black Box** is a device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It has two buttons, two switches, and a set of dip switches visible from the outside. It plugs directly into the back of the 600XL, 800XL, and 130XE computers. Custom cases may be an optional expense. The **Black Box** performs three main tasks: interface to a SASI/SCSI bus device (hard disks), Parallel printer port, and a RS232 port. A fourth option, available soon, will be a floppy disk port, especially useful to XF-551 owners. The SASI/SCSI port provides the necessary signals for hooking up most common hard disks, You may partition your hard disk into as many drives as you wish; up to 9 can be accessed at at time. By pressing one of the buttons on the **Black Box**, you will enter the configuration menu, where you can re-assign drive numbers, etc. When you exit, you will be right back in the program you were running when the switch was pressed. Each hard disk can be write-protected. The Parallel Printer port will allow you to hook up any printer that uses the standard Centronics interface. As an option, you can use the computer's extra memory as a printer buffer, or order the **Black Box** with 64K of on-board RAM. You may assign printer number and line-feed options within the menu (for use with multiple printers). Another amazing feature of the **Black Box** is the built-in screen dump. By pressing a button (on the box), the contents of your screen will be dumped to your printer (you can define text or graphics modes with a switch)! The RS232 port supplies the full RS232 spec signals for connection to a modem, or another machine (for null-modeming). The handler for the **Black Box**' s modem port is built in and takes up NO memory! The port handles rates up to TRUE 19.2K BAUD! A future upgrade for the **Black Box** is a floppy disk interface board. This will allow the addition of up to four 5.25" or 3.5" mixtures of floppy drives to be used with the system. The drives will act like standard single/enhanced/double density disk drives, but MUCH faster! All drives will be Super Archiver compatible, and support up to 2 sides of 80 tracks. Along with this hardware upgrade will come software capable of reading, writing, and formatting disks in IBM's MS-DOS format and the Atari ST format, and allow you to transfer files between those disk formats and the Atari's format. In addition , a machine language monitor has been added to allow memory disassembly, memory/register changes, and more. The Price of the **Black Box** is $199.95 for the basic unit and $249.95 with 64K of RAM (for printer spooler) plus $8 for S/H/I. An optional custom **BLACK BOX** case is available for $39.95 extra. The Black Box is a product of Computer Software Services...Not the Black Box Corporation!

$\$199^{95}$ The "MULTIPLEXER"!© $\$199^{95}$

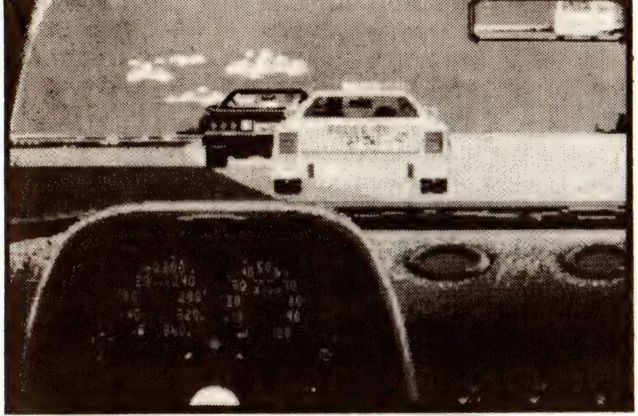
This device brings the power and flexibility of larger systems to your 8-bit. The **Multiplexer** is a device (actually a collection of modules) that allow up to 8 Ataris to read and write to the same drive (typically a hard disk), printer, and talk to each other. One "master" computer (any 8-bit) is equipped with the master **Multiplexer** interface. Then up to 8 "slave" computers can hook up to the master, each having their own slave interface. The "common" peripherals (things that are to be shared) are connected to the master computer. On each slave, all disk and printer I/O is routed through the master, so no drives are needed on them. The master computer can be configured in any manner you wish - you can for example have certain peripherals "local" to the slave, or routed to a different number on the master. Under development is a BBS system that will make full use of this device, allow ing up to 8 lines/users to be using the system at the same time! A multiuser chat mode is a feature of this program, however, you do not NEED this program to run a BBS with the **Multiplexer** (but be warned that not all BBS programs will run concurrently). All slaves are independent, and do not need to have the same program running on them. This system is excellent for BBS SysOps, because you can be using your hard disk(s) while still running your BBS uninterrupted! Another example is in a classroom situation, or anywhere a disk needs to be shared by different people. This is an EXCELLENT programming/debugging tool as well! The **Multiplexer** price is $199.95 for a master and two slave units (plus $5 S/H/I). Additional slave units are $99.95 each.

HARD DRIVE & LIMITED SPECIALS

Hard Drive Systems include drive, Black Box, a zero RF power supply, controller, cables DOS and assorted HD software. All systems are wired, preformatted and have sample programs on them. Attach to your computer and BOOT! No hassles! We have systems available from 5 meg to 108 meg. Prices start as low as $399.95!

Limited Specials are on a first come, first served basis. Preowned items are in exceptionally clean condition and are in perfect operating order. All items are warranteed. Sorry...no rainchecks...no Dealer Discounts. S/H/I to be determined according to weight and value of each item purchased

1. 5 Meg removable or 10 Meg fixed Hard Drive Systems...NEW!	$399.95
2. 20 Meg industrial HD system	$495.00
3. 32 Meg industrial HD system	$595.00
4. 64 Meg industrial HD system	$750.00
5. 108 Meg industrial HD system	$995.00
We have all HD sizes from 3.5" to 8" industrial—any capacity!	
6. Adapter 4000A controller	$89.95
7. Adapter 4070 (RLL) controller	$125.00
8. Western Digital controller	$59.95
9. Xebec 1410 controller	$69.95
10. 130XE x/320K Power Plus and Ultra Speed+	$250.00
11. 1050 drives with SUPER ARCHIVE II and SILENCER	$250.00
12. Magnavox 80 column GREEN screen monitors w/sound	$59.95
13. DISKCRACKER (newest version)	$19.00
14. SILENCER (for 1050)	$19.00
15. BLACK PATCH master w/DATA DISKS 1+2	$35.00
16. SUPER PILL w/o case	$25.00
17. SIO Amplifier	$39.95
18. QUINTOPUS/QUINTOPUS II (Switchable Ports)	$39.95/$59.95
19. XE551 Enhancer	$29.95
20. Power Plus memory upgrade (256K or 320K)	$99.95
Lots of used equipment...cheap...call!	
VERY LIMITED—Remote IBM type keyboard with interface for Atari 8-bit computers...complete!	$99.95



TEST DRIVE II: THE DUEL

Mike Bonkowski (MACE)

It's finally here!!! Test Drive II: The Duel is out. But how does it compare with the original?

I have been waiting for this program to come out ever since it was released for the IBM machines last year. I saw all those wonderful scenery and car disks, especially the muscle cars. I called Accolade in March, and I found out it was released about a month earlier.

A couple of quick calls to my dealers and Test Drive II was on its way.

I believe Accolade listened to all the comments and complaints about the first and set out to correct those in the sequel. Most of the users of the original version will be very surprised when they try out this game.

The cars are "super" responsive. The original had very basic steering, and was very sluggish. This game gives new meaning to the word "oversteer." It is *extremely* easy to try to steer around one car and crash into another car or tunnel wall.

Did I say tunnel? Yep, there are three tunnels on the second scene of the master scenery disk, and each one is longer than the one before. They are also two lanes wide. So, it's near impossible to pass in a tunnel.

Thankfully, the scenery changes from round to round. You are not "locked" into the same type of scene as you were in Test Drive I. There are six different scences.

The first scene (level) is a flat open desert, where you can really "open it up." The second scene is a mountainous road, similar to Test Drive I, except that the road has no guard rails and has tunnels. You will also get a very weird sensation as your car goes over the edge of the cliff and crashes into the valley below.

The third scene is of a winding, tree-covered road. The fourth is similar to the second, except the mountian is on the right side, instead of the left. The fifth is similar to the third, except it is is more winding. The sixth is like the first, except it is *extremely* winding, almost in circles at times. Also, the third through sixth screens are heavly patrolled.

Overall, game play is still very similar—you are still "behind the wheel" of the car of your choice, either a Porsche 959 or a Ferrari F-40. Both are extremely sensitive to turns. Through my own trial and error, I have found that the Porsche is a little easier to drive and control, but not much.

In addition to what was found in the original game, this version also shows the distance you have to travel, distance to gas station, and elapsed time. You also have a graphic display of where you are on the course, where your opponent is, and where, if in pursuit, the police car is.

They also changed the sounds of the game. People who were annoyed by the "whine" of the original, will find that Accolade now uses digitized sounds, so it even sounds like you're really driving this car.

They even changed the traffic. The original had only three types of cars, all Fords. Now, there are Mercedes, Chevys and Fords trying to share the road with you. (Fat Chance! I own the road. I pay the electric bill.)

You can race against the clock or against a computer-controlled car. I have found it is a lot easier to race against the clock, since you will not have to worry about the computer car possibly boxing you out of passing traffic and slowing you down.

You now also have control over the traffic and type of transmission in the car. This version has a slide bar that has a setting for "Auto-Shift," a near automatic transmission. This bar also sets the speed and the amount of traffic on the road. The closer you set the pointer to "Pro," the harder the game is to play.

They even improved the crash and "blown engine" effects. When you crash into another car, you actually see the hood crumple and glass break. When you blow the engine, instead of a simple message of "Blown Engine" and cracked glass, you get a rear view mirror full of smoke. Nice touch. It make a lot more sense than a cracked windshield.

And the best part? Accolade decided to release it on two unprotected single-sided disks. You can copy it to one double-sided disk, or even to a hard drive! Accolade decided to use a "Code Wheel" instead.

Accolade deserves a round of applause. To release a game like this with no copy protection, it must take a company a lot of trust in its users. *So let's not let them down, shall we?!*

The only things I found wrong with this program are minor—a seldom occurring bug where the game stays stuck at the main menu. A quick movement of the cursor on the "rookie-pro" slide bar solves that problem. This could be the fault of my Mega ST. The other "annoyances" are that the Porsche 959 is an "all wheel drive" car, but only the rear wheels spin in the demo, and the computer shown in the "play against the computer" Icon is an Amiga 1000. Come on...the least Accolade could have done was change it to a ST. But I nit-pick.

Overall, the game is first rate. The program ran the first time, on a machine it wasn't designed for. It is "listed" for 520/1040 machines, and even Accolade, when I contacted them, was not sure if it would work on my Mega. Well it did, even with add-on boards and a Mac emulator hanging out of the cartridge port.

My final recommendation is *buy it!* Now if you'll excuse me, I must return to my Porsche. I left it idling, to challange that ST to a rematch. I wonder if anyone would want to buy my old copy of Test Drive I?

Test Drive II
Scenery and Car Data Disks

When I purchased Test Drive II, I also ordered all the data disks that are available. I mainly wanted to experiment with different cars. You can get tired of the same scenery and cars after a peroid of time, especially when the cars are not *really* what you want.

So when Accolade released Test Drive II, and stated that it would have additional cars and scenery, I couldn't wait. There are four disks for Test Drive II—The Supercars, The Muscle Cars, California Challenge and European Challenge.

Car Disks

The Supercars data disk is very much like Test Drive I's cars, except that instead of a Porsche 911 and Corvette, the cars are the Porsche 911 RUF Twin Turbo and Corvette ZR1. Otherwise, the cars are basically the same. The Lamborghini has lost its rear fin, but that is about the only change. The only car I am utterly disappointed with is the ZR1. If this game exactly simulates that car, I am not interested! As you will see below.

The Muscle Cars disk is the disk I *wanted!* Here are the cars I grew up with, and now cannot afford. If you purchase Test Drive II, get this disk as well. You won't be disappointed.

The cars on this disk, top speed in brackets, include 1963 Corvette Stingray (142 MPH), 1968 Shelby GT500 Cobra Mustang (138 MPH), 1967 Pontiac GTO (107 MPH), 1969 COPO 9560 ZL-1 Camaro (154 MPH), and my favorite, a 1969 Dodge Charger Daytona (144 MPH).

With the exception of the GTO, which is the slowest of the cars, they can all beat the ZR-1. The GTO can even beat the ZR-1 if the Corvette crashes even once. How pathetic—1990 Technology beaten by 1969 Horsepower! That doesn't say much for the new Vettes, does it? But I digress.

All of the cars are very nicely drawn. The '63 Vette is best, due to the use of shading. Sadly, the '69 Daytona is only very good. For some odd reason, Accolade chose to make the car completely dark blue. And actually, the rear of the car is almost completely wrong. It looks more like a 1970 Plymouth Road Runner Superbird than a 1969 Dodge Charger Daytona. But, it's still a very nice car.

Scenery Disks

The California Challenge scenery disk has six different scenes. Trees of Mystery to Eureka—a mostly straight stretch of road and not patrolled. Eureka to Rockport—this stretch of road has a lot of climbing roads and sharp turns. Rockport to San Francisco—here, the streets are straight and flat, open it up and gain some time. The last three scenes I have not yet seen—San Francisco to Carmel, Carmel to Santa Barbara and Santa Barbara to Mexico. I cannot tell you what to expect, but the screen shots look nice.

The European Challenge is the other scenery disk available. Due to a delay, I have not yet received it. According to the Accolade catalog, you drive through The Netherland, drive on the beaches of the French Riviera, descend the mountains in Switzerland, and drive flat out on the German Autobahn. It sounds great. But more mountainous roads? I think Accolade could have come up with something else instead.

All the disks I have seen have been very good. I prefer the Muscle Cars, but all of them are first rate. When you purchase Test Drive II: The Duel, take a look at the scenery and car disks. I am sure that after racing the same two cars on the same scenery, you will enjoy the change.

Your Friendly Neighborhood Echo Boss Loves You

Tim Holt (ACCEPT)

I don't know much about those BBS networks. I have seen Nets, Mail, and Echos, but to tell you the truth, I can't figure out the difference between one and another. Our club BBS doesn't have a net, is not on an echo, and the only mail I see is an occasional complaint left to me in the E-mail.

What I know is rudimentary to say the least, but I do know that if you put a message on a net—or in an echo—you get all kinds of replies from all over the place.

Perhaps a few of you have seen the free offer our club had a few months back. Essentially, what we did was offer a free three-month membership to any ST user in the United States. No big deal, right?

Well, after posting the offer in ST Report, and on GEnie and Compuserve, I decided to put the offer on an "echo" of another BBS here in El Paso. Uh Uh. Big mistake.

I posted the message for the free offer, and about a week later, I got a reply back from the head echoer, one Pat Moffit. I guess he is important, because he has a title: "Atari ST Echo Moderator."

I am in trouble. Let me show you part of our message (the end part) and the reply Mr. Moffitt sent me:

Message #108 'NETMAIL' >
Date: 30 May 91 20:14:44
From: Pat Moffitt of 1:347/11.0
To: Tim Holt of 1:381/67.0
Subj: Free Offer

TH> This offer is taking the USA by storm! No other user group in the United TH> States is making this offer! Take advantage of it now...Time is running TH> out!

"Now this is the kind of thing I was afraid was going to happen. Another act like this and you will ban all user groups for advertizing in the ECHO.

I also find this message very annoying for the amount of space it takes up. As the moderator I don't have to put up with this.

This is an offical [sic] *warning, do not enter adds* [sic] *that take up more than one screen in the Atari_ST Echo on Fidonet again."*

Pat Moffitt, ATARI_ST Echo Moderator
Fidonet 1:347/11.0 (509) 965-2345

Holy Moly! I had no idea the Atari ST echo is so anti-user group! Let's look at what I did, and then at the response:

I sent a message that was about 45 lines long. I guess that is about 5-6K long. It was not any type of commercial advertisement; it was just an offer for our little club, way out here in El Paso.

Apparently, Mr. Moffitt thought it was too long. Now correct me if I am wrong, but don't these echos and nets and such shuffle about huge sums of messages each day? I mean, if I get things right, they deal with megabytes of information! One little message 5-6K long can't make *that* much of a difference.

Well, I could understand if *everyone* left real long messages, but out here in El Paso, I see messages that the entire contents are two or three words! And that is the *majority* of the messages. Most of the messages say things like:

"Thanks Billy Bob, I'll check it out!"

The point is, I cannot believe that our *one* message clogged up the entire Atari ST Echo in the entire United States of America.

I think that our message was important, it was addressed to every user in the United States, and at last count, we have gotten over 100 responses. Of all the "ads" we placed, 36 of the responses came from the ad that was placed on the "ECHO." (We had a question that asked where people heard of our offer.)

"Now this is the kind of thing I was afraid was going to happen. Another act like this and you will ban all user groups for advertizing in the ECHO."

Doesn't that seem to you to be an *extreme* stand to take? Even if our club did break some horrible rule, this guy would ban *every user group* in the world from using his personal echo.

Let's see, how many user groups are there? Well over 300, I think. Mr. Moffitt would ban every one for something those dorks way out in El Paso did. Thanks Mr. Moffitt.

With support like this, it is no wonder that Atari is on the ropes. This guy is supposed to be a *friend of the ST?* Well, you know the old saying, with friends like these...

"I also find this message very annoying for the amount of space it takes up. As the moderator I don't have to put up with this."

Gee, Mr. Moffitt, I had no idea that the echo limited to a certain size any message that is put up. I just put the darn message up on a local board. However, if there is a limit in size, how in the heck was I able to *leave* the message to begin with? Seems to me you need to talk to your sysops, not get your panties tied in knots when user groups try to get a few new members.

"This is an offical warning, do not enter adds that take up more than one screen in the Atari_ST Echo on Fidonet again."

Okay you user groups, this is it! The official *warning* from *Sysop Pat*. Don't advertise on the Echo again. We at ACCEPT are sorry that we have dampened your chances. Our lawyers are ready for your responses.

Seriously, aren't we ST users supposed to be working together? Haven't we all figured out by now that the user group is important to the last remaining days of our computers? With the poor attitudes like the ones displayed by Mr. Moffitt, it is no wonder that Atari is still the stepchild of the computer world.

Gee guy, lighten up! We were only trying to get a few new members! It wasn't like we posted death threats or were passing pirated material over your system! I hope your attitude changes, Mr. Moffitt. I hope that you begin to realize that user groups are the thin line that separates Atari ST computers from Atari ST *orphan* computers.

As for all you user groups out there that are "Officially warned," we here at ACCEPT offer our sincere apologies. We didn't realize that our *one* message out of the millions that are posted would cause such a response. I hope it doesn't mean we can't do lunch next week...

The Best $19.95 You'll Ever Spend.

Don't throw your time away typing words and phrases over, over, and over again.

Abbreviator ST automatically expands your abbreviations to their full length. Unlimited number of abbreviations, each up to 240 characters long. No added keystrokes, a SIMPLE to use desk acc. For example: *da* becomes *desk accessory*
wp becomes *word processor*

You Choose The Abbreviation.
You Choose What It Stands For.

Abbreviator ST cost $19.95, we'll pay the postage. Write:

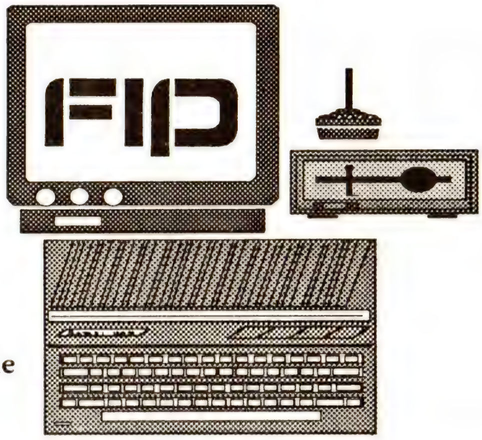
File Information Program



Chris Guenther (ACCD)

So there's nothing new or different for your 8-bit Atari, I hear you cry? Well, think again. What Atariwriter did to word processing with its power and ease of use, the File Information Program (FIP) has done for disk cataloging.

It's written in Action! (but, of course, stands alone), so everything it does is fast, and all of the functions are accessed from the single main screen. There's no hopping back and forth from one menu to another, and no disk swaps once it's loaded.

Fool Proof

Also, it's goof proof, because the FIP formats disks with a number in the first sector. If you swap disks without telling the program, it won't overwrite precious data or crash because it can't find an entry.

Data entry is very easy. Not only can you enter new data, but you can also modify any or all of an old entry. The field headings are what you'd expect. There are: 'filename' (w/extender); 'Record #' (the FIP increments this—you don't have to); 'Category' (the categories are already predefined. You just choose the one that best fits the program); 'Disk Number'; and 'Details' (which is a four line field where you can enter a more detailed description of the program).

The 'Details' field is great, because the FIP remembers the last entry here. Thus if you're entering a series of similar programs, just press <control>-R, and the previous entry is brought back, allowing you to put something like '...part 2' at the end.

Drawback?

One thing some people may feel is a drawback of the FIP is the lack of a sort function. But, because of the speed of the search routine, the user really doesn't need to reshuffle the entries.

For a test, I ran a search through the Details field for a key word I knew was only in the last of 186 entries. It took about 30 seconds to get through all the data and find it, and this was while reading from the disk! Searches on any of the other fields are even quicker, because that data is retained in memory.

Printing

If you want to print out a series of entries, just toggle on the print option, then use either the Search or Display option. These allow you to see the first, last, previous, or any in-between records.

Additional utilities from the programmer in the future (he doesn't leave much memory available for any major changes) may include a sort routine, a pack utility to take out deleted entries, and maybe a program to convert the data files to standard text, so they can be printed by a word processor.

The File Information Program can be obtained by sending **$12.50** to:

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

Video Titler III

For The 8-Bit

Ellen Lentz (ACCT)

Video Titler III (VT3) is a shareware program produced by Andrew Buongiorno. The purpose of the program is to produce titles which can be transferred to a VCR tape. It requires 48K memory and BASIC.

How VT3 Works

The program is divided into two parts and produces two types of files. One is called a Title and the other, a Screen. Either can be transferred directly to the VCR, but the Screen can include a picture with text, and a Screen can be incorporated into a Title.

There are several Screens included on the disk. These pictures can have text added to them and used in your own Titles. There are three .TXT files which can be printed out, giving information about the programs.

There are also two Titles—DEMO and SCREEN—which can be viewed to demonstrate what Titles can do, and the different Screens available.

On the back of the disk are two programs which allow you to convert MicroIllustrator and Fun With Art pictures to the MicroPaint format, which is used by VT3.

Getting Started

The program, once loaded, is resident in memory at all times, so you can remove the program disk and work with your data disk. The Main Menu is quite comprehensive. It allows you to List the names of the Titles and Screens, Enter changes, Retrieve, Display, Save, or Delete a Title and Paint (Create, Retrieve, Display, Change, or change colors) on a Screen. The Paint option is a very elementary drawing program, but it is useful when applying text to a picture.

There is also a HELP option on the menu which lists the commands used to create a Title or Screen. These commands can be listed to a printer for future reference.

Creating Titles

Titles are actually BASIC programs which are entered under the Edit option, complete with line numbers. The same features apply as in writing a BASIC program—you can list the whole file or a portion of it, delete a line by entering the line number only, change a line by typing over it or add new lines which fall between existing lines.

If you are creating a new Title, the line numbers are presented to you; if changing a Title, you supply the necessary line numbers. Commands can be typed in either upper or lower case.

You can flip between the Edit and Display options very easily—create your Title, then see what you have created. Then go back and add some more, or change it if you want to. Every so often, you should Save the Title, in case you do something illegal to generate an unrecoverable error. You have to reload the program after such as error, but you can then Retrieve your saved Title and continue.

VT3 commands are preceded by a period (i.e., .S). All other text entered will be displayed on the screen. You can have three sizes of letters, three different colors of text on one page, 16 background colors, and nine different intensities.

You can position the text on a certain line and between margins (useful if you want the text to appear in a certain position on a screen) and scroll the text horizontally or vertically. The text (if not horizontally scrolled) will be centered on the page, and both upper and lower case letters can be used. Screens can be entered with the ".Pict (filename)" command and music can be generated with ".Song" command followed by the appropriate code for the music.

An illustration of the foregoing can be observed by Retrieving the Title DEMO, then Displaying it. Each of the above features will be presented. To see the coding generated, use the Enter option. LIST will then list the code (you can stop and start it by toggling with CTRL-1).

Although these are BASIC programs, there is no way to list them to the printer, unless you first load a screen dump program (such as Humpty-Dump), run VIDEOTL3.BAS, use CTL-1 to stop and start, and then print each page to the printer. There will not be enough memory left to Display the Title, but since you have your printed listing, you can then reboot the program.

Since the word "screen" has a specific meaning here, the word PAGE will be used to describe what you will see on your TV screen or monitor.

To get a new page, you must enter the size of the letters you want—.S, .M or .L. You should then set the colors and intensity of your background and text. The default is a black background and gold text. On entering your text, you are limited to the number of characters on each line—about 18 or 20 characters for the small text. .Blank can be used to get a blank line between text. You can get 12 lines of small text on a page.

Entering a Screen will also produce a new page, but you can enter text on this same page (using the line number and margins). Entering .Song will not change the page.

Coloring

The colors available for both background and text are: Gray, Gold, Orange, Red, Pink, Purple, Navy, Blue, Lt. Blue, Aqua, Gb, Green, Yg, Og And Lt. Orng.

To set a background color, use .B (color). For the text, just .(color). Remember, only 3 colors can be used on a page.

The intensities are .Dk (0-4) or .Lt (1-4). The higher the number, the darker (or lighter for .Lt) the intensity. Again, for background, you use .B first.

Two other commands are available. .Pause (.1-5) will hold the page on the screen for the specified length of time. .Goto (line number) will create a loop.

Once you have the title DEMO loaded in, try changing it to see the effects of the above. It will not affect the original file. If you wish to save your changes, save the file to another disk.

To see the coding for the first page only, enter LIST 10,120. This shows an example of starting a page and using the background colors, intensity, and inverse type (use the Atari key for this effect).

List 120,370 for the 2nd, 3rd, and 4th pages. This demonstrates the different sizes of letters that can be used.

The 5th page, list 380,480 shows the text in three different colors. Try changing the colors.

490 through 830 changes the background colors on the page, and 840 through 1040 changes the background intensities. Note the use of the .Pause command.

1050 through 1210 is an example of the vertical scrolling. Note that no background color was specified so the default (black) will be used.

1220 through 1280 is an example of the horizontal scrolling. The screen is loaded (.PICT VT), line position is chosen (.VPOS 8), margins are chosen (.LMAR 3 and .RMAR 16), and the number of times the text is to be scrolled (.HSCROLL 3). The text to be scrolled can be any length.

1290 through 1310 loads the screen MUSIC (both screens VT and MUSIC are on your disk) and plays the song coded in line 1310. For those with a musical background, C is Octave 3.

1320 through 1340 is the final page and the Goto 10 at line 1350 returns to the first line and continues the display until you press Start, which returns you to the Main Menu.

Experiment with changing the text, text colors and background colors, or add some more text of your own. Hitting return with no entry will take you back to the Main Menu, where choosing Display will show you the effects of your changes. Press Start for the Main Menu again and choose Enter to make more changes.

To start creating a new Title, choose Enter, and type New instead of List. Line numbers will be generated for you until you exit. When you return to this feature you will have to supply your own line numbers. Take care because the keys are rather sluggish.

The PAINT option on the Main Menu is to allow you to draw your own screens but you would be better off using a drawing program such as Micro-Illustrator (Koala), Micro-Painter or Fun With Art, then converting these screens. The only two editing keys that work as specified are the Print and Fire Button.

Position your cursor to where you want to start printing, then hit 'P' and start typing your text. RETURN will turn it off. You must use a joystick to control the cursor, which will first appear in the middle of the screen. Holding down the fire button will draw a blank line. "Q" will quit the Paint option without saving the picture, but START will save the picture, with not always satisfactory results.

There are two programs provided on the back of the disk to convert screens. PICCNVRT.BAS will convert Micro Illustrator (Koala), Micro-Painter, and Fun With Art screens from one format to the other. It will alert you if the format you've chosen isn't correct.

Some of the picture files with .PIC extenders are actually Micro-Painter pictures and only need the extender changed to .MIC. This program will tell you which it is and you can copy from Micro-Painter to Micro-Painter, getting the .MIC extender. This program allows you to use two disk drives and shows you the picture before it is converted. You use the full name of the files.

VT3UTIL.BAS will convert a picture with the extender .MIC to a screen with the extender .SCN. There are two options available. XTFR will copy .MIC files from one disk to another. You should only put about 6 files on a disk to leave room for the .SCN files. PROCESS converts .MIC files to .SCN files on the same disk. You have the choice of copying every other line on the .MIC file, or copying only the top half of the picture. This is because Micro-Painter has 160 rows and Video Titler has only 80 rows. In either case, you'll get a full screen. Try them to see which one you'll like best.

VCR.TXT has the instructions to hook-up your computer to your VCR. Print this file (also the two READ.ME files) from DOS.

This is a very useful and easy-to-use Shareware program. If you enjoy it, show your appreciation by sending a few dollars to the author and keep these good Shareware programs coming.

Video Titler III—Andrew Buongiorno, Box 257, Brooklyn, NY 11214

The Right Brain
Shareware

Paul Stampfli
ACCEPT

Many years ago my Grandfather said something that, for some reason, stuck with me throughout my life. It was one of those things that he probably said in passing without giving it a lot of thought. But, to my child-brain, it sounded like genius, and stayed there forever.

What he said was, "You get what you pay for, Knuckle-head." True, I doubt this is an original saying, but I do have a lot of hero-worship left over for my Grandpa that I never had the chance to give him.

Which brings me to Shareware and Public Domain. For some reason, these have been lumped together over the past few years like they were the same thing. They aren't.

For those of you new to computing, or living under a rock for the past ten years, or perhaps if you have been ignoring Shareware fees, here it is. Shareware is *commercial* programming.

True, it doesn't come in a fancy box and have a fancy name like the stuff you get at your local dealers. It doesn't even come in plain, brown wrappers like the stuff you get from mail order houses, but it *is* commercial programming just the same.

What these brave souls, (Shareware programmers) have done is tried something *very* American. They have attempted to beat the system. These guys, mostly, are "back room" programmers that have created something they feel has value and use, but they can't afford to promote it or don't want to sell control of their beloved creation to a big, impersonal company.

They have set it adrift in the world of the computer and relied on people's honesty to send in their fees for their income. Generally, these folks are *very* disappointed in this method of doing things. Why? Because we computer users *don't pay*. It's just that simple. Oh, sure, we talk big stuff, but we don't pay up.

Public Domain, on the other hand, is just that—Public Domain. Anyone can have it, and anyone can freely give it (or often sell it) to anyone else. Some of these efforts are just plain garbage, and others are just plain wonderful. It just depends on what you want, or need, at a given time and the "Brownian" movement of software in the public domain scene.

Is this just another Shareware plea from a "back room" programmer that wants to make a few more bucks? Yes, and no. This is another Shareware plea, but not from a programmer. (I couldn't write a line of code if my life depended on it!) The doom and gloomers are always talking about the ST market drying up and moving on to other operating systems. Well, eventually, the ST will die. But I'm afraid that we are helping to kill it.

If we support the low-budget programmer—the "hobbyist" programmer— that writes good shareware stuff, he will continue to write good stuff. And since he is a hobbyist, has a day job and isn't likely to go to work for IBM tomorrow, he will probably continue to write programs for a "dead language" computer long after the big companies have moved on. (Look what's happening to the Atari 8-bits!)

They, (the big companies) have to make big profits to stay in business and will not continue to support a computer with a small, and shrinking, installed user base.

But the Shareware programmer, who needs no such "big bucks" will continue to support us IF we continue to support him or her. So pay your Shareware fees, folks! It will help us all in the long run, and hurt us all if you don't.

Besides, like the man says, it's the right thing to do.

Shareware authors... rely on people's honesty to send in their fees for their income. Generally, these folks are *very* disappointed...

TextPro Configuration

John McGowan

(This article is Copyright 1991 by John McGowan but can be reprinted ad libitem provided this notice and the source from which you obtained the file are given credit.)

This article is for those who use TextPro version 4.54 (or later) and who also have a RAMdisk (there are some SpartaDos specific recommendations, but similar procedures can be used in MyDos).

One difficulty I had when I first used TextPro (from hereon referred to as TP) was that I had many macros and help screens and had to be sure the proper disk was in Drive 1 before accessing them (either by using the HELP key—OPTION-? on the 800—or CTRL-V to load a macro).

However, as indicated in the documentation for TP, this *can* be avoided *if* you have a RAMdisk.

Here's how to set TP to use a RAMdisk. First, boot TP, then load TP into itself as a text file! Do a global search and replace of "D1:" to "D8:" (assuming your RAMdisk is numbered "D8:"). Then, go to the head of the TP file and look through it to find the title screen and edit that to indicate that the program has been configured for RAMdisk (just overwrite some of the text with a "RAMDISK CONF" message...be sure not to overwrite the copyright notice).

Now, save the file as TPRAM.COM (when you save it be SURE the command line is GREEN indicating that you have NOT changed the length of the file).

When you write macros, be sure they access files from 'D8:'. For example, if your macro file needs to load a configuration file, use a "SELECT-CTRL-L BACKSPACE 8:cnfgfile.name" command in the macro.

The BACKSPACE (entered by pressing the ESCAPE key and then the BACKSPACE key) will delete the ":" in the "D:" prompt on the command line and replace the "D:" prompt with "D8:cnfgfile.name" to load the file from Drive 8.

Do this for all relevant files (help screens, configuration files, fonts if you use the TP fontloader program I wrote, or use TP 4.56 which allows new fonts).

Make sure everything is on "D8:" and you will access everything from RAMdisk and have all your macros/help files, fonts, etc. immediately at hand with no worry about disk swapping.

As an example, I have modified TP to run from RAMdisk as above and have a STARTUP.BAT file for SpartaDOS with the following:

```
RD D8:
COPY D:TPRAM.COM D8:
COPY D:*.FNT D8:
COPY D:*.MAC D8:
COPY D:*.CNF D8:
COPY (other files of mine)
D8:
D8:TPRAM
```

This ensures that all the files that TP looks for load in immediately—TEXTPRO.FNT, TEXTPRO .MAC (TEXTPRO.MAX in version 4.56 and later!), configuration files etc. are on D8: and the conversion to TPRAM ensures that the program looks to D8:.

As all configuration, fonts and macros are on Drive 8 and all my macros have been converted to find files on Drive 8, I never need have a disk in the physical drive! Further, as TPRAM.COM is on Drive 8 as well, if I exit TP (CTRL-X) to do some DOS utility work (such as format a disk in Sparta format, XINIT) or run some utility, I type "D8:TPRAM" and TP reloads, finding all its files...on Drive 8! (very fast!)

The main use I have for this is with DaisyDot3 (DD3). My TEXTPRO.MAC file is a DD3 formatting macro file which has the OPTION-CTRL-P macro designed to do a binary run of DD3 from "D8:" (yes, my STARTUP.BAT copies DD3 to D8: as well!)

I can then run TP, edit a file and save to D8: (OPTION-CTRL-S is defined as a save to D8:!), hit OPTION-CTRL-P and be in DD3 before you can say "uncle." I then print the file, exit to DOS, enter "D8:TPRAM" and I'm right back in TP with my TP macros and configurations loaded (from D8:) VERRRY quickly.

If you have enough memory for a RAMdisk, consider modifying TP to access its files from RAMdisk. It makes it fast and handy (there is the option of using SNAPSHOT instead, but I leave that to SnapShot users to work out).

Additional Notes

I have had some trouble with ICD's RAMdisk handler for "D8:" using my RAMBO and using TP454XE, the XE version which allows three files in memory at once.

If you have a copy of the PSIRD .COM file, which is a SpartaDOS RAMdisk handler from PSI, use it instead.

[Ed: The PSI RAMdisk is one of the programs contained on the June '91 AIM 8-bit Disk of the Month.]

Boot Fix

Glenn Dulin (COAC)

The Problems

When I purchased my 1040 STE I quickly found it wouldn't work with my SH204 Atari hard drive. It seems there is a hardware problem with the host adapter or something. There isn't a simple fix and the one there is isn't worth it. The drive is fine when working with normal STs even with TOS 1.4.

Now, this upset me quite a bit. I had documentation to get out for a PC program I had written! I needed my software! I needed my hard drive! I found a good price on a SyQuest drive and ordered it. I was wanting to get one for a long time anyway.

I got the drive and found that the SyQuest, which is a SCSI drive, needed to be booted twice before the computer would boot from it! So, whata-ya-do? You put a disk in drive A: and the COLDBOOT program in the auto folder and watch the computer boot a few ridiculous times before you can use the darn thing. Geez! This hardly seemed like a reasonable way for any high class computer to act.

With my older system I had to turn on the hard drive, wait for it to spin up, then turn on the computer. Double Geez!

Yea, I know all this isn't up there with the plight of the Kurds or the poor storm-struck folks in Bangladesh. But geez!

Yea, the good news is coming.

The Reason

The above problem with SCSI drives is common. All the SCSI drives need to be awakened first, then booted to be recognized. Except that some drives can have a bit set in the SCSI controller to allow you to boot only once. These are Seagate and Quantum drives. ICD's software will set this bit. Of course I don't have one of those!

The Solution

Enter...shareware from Art Zeigler. Art has managed to cure, smooth and down right blow away all the aforementioned absurdities.

Ta daaa—SCSI Boot to the rescue. A low-powered name for a high-powered gem. I have already received a revision of this wonderful boot fix. It's SCSIWAI2.

It's simplicity itself. You run the program and it writes a boot sector on a floppy in Drive A:. When you boot from this disk, the program awakens the hard drive and waits for the drive to spin up and become ready. Then, the operating system does its thing and boots off the hard drive.

You can turn your whole system on at once and not have to wait for the spin up or for that double boot! This does mean you will have to boot with this disk if you want it to work, but I found this not a problem. I have but one drive, but the software shows the ready status of all seven on-line SCSI devices. It's marvelous!

The Price

Art says send him $5 along with a disk and your address and he will return the latest to you. I think it's worth more.

The Place

Art Zeigler, 1719 SW 16th Ave.,
Apt #4, Portland, OR 972011

The Goodbye

Goodbye!

" Its even more remarkable when you think it was written before wordprocessors were invented"

THE FONT RESOURCE

Welcome to *The Font Resource,* our new monthly column spotlighting some of the latest font releases for your favorite ST DTP packages.

This month, we're going to take a look at two of the many disks available from Computer Safari under the Safari Fonts title.

Computer Safari is, by far, the most prolific font supplier for PageStream. In fact, most of the font disks sold by Soft-Logik actually originated from Computer Safari and its president, Jay Pierstorff.

Many of the newest Safari Fonts disks contain font versions for both Calamus and PageStream. The quality of all their fonts is excellent. You really can't go wrong with any of them!

For purchasing information on any of the fonts showcased here, or for details on other font disks, contact Computer Safari, 606 W. Cross St., Woodland, CA 95695, phone (916) 666-1813.

AIM
ST Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the August '91 disk. For more complete docs, see the text files contained in most of these archives.

CLOCKSET.APP—This is version 1.3 of CodeHead's ClockSetter. It lets you set the system time and date. You can also use ClockSetter in your AUTO folder to read the keyboard clock and set the GEMDOS clock. New features allow you to input time in 24-hour format and a bug has been fixed which caused a lockup on some systems. ClockSetter is freeware from CodeHead Software.

DCRESERV.APP—DC Reserve will save a predefined amount of memory when you execute a program. For example, when you run FLASH! it takes all free memory for its capture buffer. With DC Reserve installed and set to reserve 100K of memory, you will get 100K free RAM in FLASH! to use for other things (like DC Shower or DC Xtract Plus). 100% Assembly. ST, STe and TT compatible. From Double Click Software.

DCSALVAG.APP—Ever try to copy a file that had a bad sector in it? What happened? Couldn't copy the file? DC Salvage will rescue any file from the junk heap. Just tell DC Salvage which file to copy, and it'll copy as much of the file as possible, displaying info all the while it is copying. 100% assembly. ST, STe and TT compatible. From Double Click Software.

HORSTCAP.APP—Horst Caps, a "curly-Q" display head font for ISD's Calamus. Converted from a PD Mac Postscript font.

HP2WWDRV.APP—WordWriter ST printer driver for the HP LaserJet II. Now, you can take advantage of the HP's abilities via WordWriter!

MICRON.APP—Micron Demi and Micron Bold Extended fonts for Calamus. Includes italic versions. This font is similar to Eurostyle. Excellent for headlines. Shareware.

MINI_6.APP—Yet another Shareware font for Calamus, Mini <6> is specially designed for optimum printing at 6 point on a 300 DPI laser. This font should not be used above 7 point, but it can produce legible text even lower than 3 point!

MINT_07B.APP—MiNT (MiNT is Not TOS) multitasking operating system for the ST/TT. Allows access to GEM and can handle MINIX formatted partitions. Complete documentation included.

SOLITARE.APP—Demo of a sharp-looking solitaire program. Color only.

STW4DOCS.APP—Documentation for STWriter Elite version 4.2.
STW4ENG.APP—Version 4.2 of ST Writer Elite Word Processor. Fixes some cosmetic bugs and adds scrolling help dialog box accessed via the Help key from the Edit window. Works in all resolutions on ST and TT, with 3 font sizes on TT med and high res. Fully configurable.

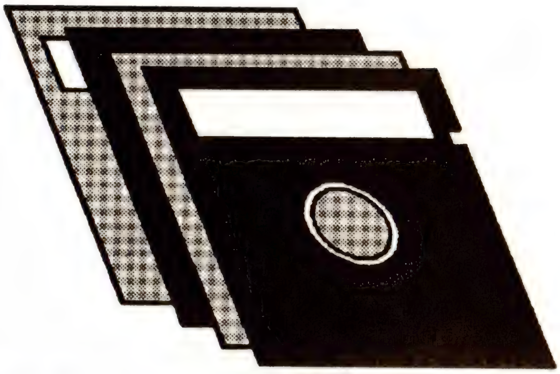
STW4GER.APP—ST Writer Elite 4.2 German version of the program.

STW4SPN.APP—ST Writer Elite 4.2 Spanish version.

UMORIA.APP—Version 5.2.2 of UMoria, a D&D-type game similar to Hack or Rogue. Uses "text graphics," and is very addictive. If you've played Hack, Rogue, Phantasie or similar games on mainframes or UNIX systems, you'll love UMoria.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the August '91 disk when ordering.

AIM 8-Bit Disk of the Month August 1991



Each AIM 8-bit Disk of the Month is a single-sided, single-density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility and to decompress files with a DCM extension, you need DISKCOM3.UTL (available from most BBSes, user groups or on the April/May '91 AIM 8-bit Disk).

Here's a short description of the files on the August '91 disk. For more complete documentation, see the text files contained within most of the ARChives.

Side 1

BRIKBAT.DCM—A 2-player combat game where you control a Breakout-type paddle to volley the ball and knock out bricks. But, there's a twist—you also get nifty items like a laser gun, etc to fire upon your oponent. Adds a whole new dimension to the old Breakout style game. Excellent playability and good graphics. Disk-comm'ed boot disk. Shareware.

GLYPH.ARC—A font editor and utilities package. This ARC includes Glyph (the font editor), Rosetta (a conversion utility), documentation and a number of fonts. Shareware.

SOURCES.TXT—Text file listing names and addresses of companies that still support the Atari 8-bit computer. From PD software to hard-to-find commercial programs to hardware to magazines, there are still companies out there if you know where to look. So, look right here!

WARPZONE.ARC—PD "demo" release of a game written for the Atari some 7 years ago. In WARPZONE, you blast the aliens while collecting all the crystals from the various sectors in each level. Complete game available for a Shareware contribution to the author.

Side 2

EXTENDED.ARC—Extended Atari BASIC adds DOS commands, line renumbering, automatic line numbering, joystick cursor control, clock, function keys, and many other commands and functions to Atari BASIC. Runs on XL/XE's with at least 64K RAM and built-in BASIC. Works well with DOS 2.5 and MyDOS, but doesn't work with SpartaDOS. Docs and three sample programs included.

INFOMIND.ARC—INFO MINDER is a new full-screen database program for all Atari 8-bit machines. Written in Atari BASIC, user customizing options, easy data entry and more. Very easy to use and flexible enough for almost any purpose. UNARCs to 662 sectors, so be sure to use an empty disk (no DOS) to UNARC.

MYDOS80.ARC— An 80-column menu for MYDOS 4.5. Works with any 80-column driver, but the README file in this ARC is for the XEP80. This replaces the DUP.SYS of MYDOS 4.5.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the August '91 disk when ordering.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, from 6:30 to 9:30 PM. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Library of about 700 disk titles. Each month we publish (FR)ANTIC covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

President	Richard M. Houser	(505) 299-3977
16bit Vice President	Everett Schnetzer	
8bit Vice President	Ed Skeans	
Secretary/Treasurer	Mike Evans	

General membership AACE members meet twice monthly, on the first Saturday and third Tuesday of each month. An 8bit meeting is held on the second Tuesday of each month. On the first Saturday of June and December, a Swap Meet is held. Dues are $20 a year payable in January. Members receive an AIM subscription, access to our 16bit and 8bit PD library and membership in the ASTRO BBS (505) 260-0448 Club membership is at an all-time high of 36.

AUSTIN ATARI COMPUTER ENTHUSIASTS

Our new slate of Officers has generated some new activity in the Club. We have a new MIDI SIG that is six months old, and have just started our second C class. This one is different, part tutorial, part hands on. The only problems were installing the new compiler for the 8 bit users and getting the Mark Johnson C in the ST library to work at all(we didn't have anyone who spoke fluent UNIX). All in all this class was more fun than the last one.

We are still looking for a semi permanant meeting room. All of the options turned into duds because of location, size, parking, and most importantly-liability insurance(it's a killer). But we'll meet the first Wednesday since it's time for a change. Our current meeting is a combined Disk Party, General Meeting, and Officers meeting, but it gets kind of cramped both in space and time.

Both our ST and 8 Bit libraries have been revamped, with more changes coming. They will be easier to access, and have more data per disk at the same price-the ST will be double sided and the 8 Bit will be flippy(SD). 8 Bit lists are available, with new disk update lists printed as needed. Early summer should see the 8 Bit library finished with more new lists printed. Also in early summer will be the AUSTIN COMPUTER FAIR. We have attended that in the past and may this year provided we can get a lot more volunteers and more organised than last.

The Atari Clubs of Denver is an umbrella group consisting of: Atari Club of Denver, Starfleet User Group and the ST Interest Group. Atari Club of Denver meets the first Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7:00 PM. Starfleet User Group meets the second Friday of each month. We meet at Pamona High School 8101 West Pamona Drive in Arvada, Colorado. The meeting starts at 7:00 PM.

Atari Club and Starfleet provide support for Atari 8-bit owners.

ST Interest Group meets the third Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7PM. The ST Interest Group provides support for the entire ST computer line.

Our address is: Atari Clubs of Denver POBox 24064 Denver, CO 80224. For additional information call our BBS at (303) 343-2956, 24 hours, 300-2400 BPS.

ACCEPT

Atari Computer Club of El Paso, Texas

ACCEPT (Atari Computer Club of El Paso Texas) ACCEPT is the only Atari club in the entire El Paso southwest. Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT 10953 Yogi Berra El Paso, Texas 79934

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCEPT executive committee Steve Bruck, Tim Holt, L.R.'Pete' Rosh, Dave Davis

ACCT

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher cost.

ACCT meets on the second Monday of the month, from 7-9 pm at Bassett's Health Foods, 3301 W. Central Ave (Westgate Shopping Center), Toledo, OH. ST Sig held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. ACCT may be contacted at 4487 289th, Toledo, OH 42611 or by calling Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

ACCESS

Atari Computer Club

Encompassing Suburban Sacramento

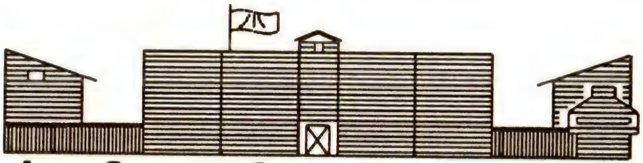
Bob Drews	(916) 423-1573	President
Ed Galvan	725-6955	Newsletter/Disk Library
Ken Helton	446-2794	Treasurer
Barry Gordon	338-1488	Modem SIG
Bob Haynes	371-1726	Archivist

ACCESS -- The Atari Computer Club Encompassing Suburban Sacramento. As usual, please call any officer if you need information, directions or even to make a suggestion. Or, you can call the ACCESS BBS at (916) 428-8662.

For those of you who don't know who we are, ACCESS is the Atari 8-bit user group for the Sacramento, CA area. We provide help and information to the local Atari community. We offer a number of meetings each month to give you more information on your computer and to answer your questions. And, of course, we are anxious for you to share what YOU know, since there always seems to be something new and fascinating in the Atari world.

Our general meeting is at 7:30 PM on the first Wednesday of each month in Classroom B of the SMUD training building at 1708 59th St, between Folsom Blvd and R Street, just off Highway 50. This is our main get-together.

Other monthly meetings are held on the following three consecutive Tuesday nights at the homes of Barry Gordon (Modem SIG), Bob Drews (Board of Directors Meeting), and Tim Naber (Disk SIG). Telephone them for additional details, but we hope you can be a part of these groups.



ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, 1150 Winton Road South. An ST Beginner's class starts at 6:45, while our 8-bit 'Basically Speaking' class starts at 7:00. Our general meeting starts at 7:30pm in room 262S, with a split into ST and 8-bit SIGs at 9pm.

ACORN has both an 8-bit and ST PD software library. Over 300 8-bit disks and over 100 ST disks are available to any individual. We operate the Dimension's End BBS at (716)436-3078, 300/1200/2400 baud, 40 MB of online PD and shareware files. Membership in ACORN is not required to access the system.

Membership in ACORN is $18 per year, and entitles you to a year's subscription to both the ACORN Kernel newsletter and the Atari Interface Magazine, 12 meetings, access to our 8-bit and ST PD libraries at reduced cost, and special access to our BBS. Our mailing address is: PO Box 23676, Rochester, NY 14692-0676.

President	Don Allis	(716)293-3415
Secretary	Chris Freemesser	(716)328-1703
Treasurer	Sam Duck	(716)461-0544

ACUNET

Atari Computer Users Network

Salem, Oregon

ACUNet is the Atari Computer Users Network in Salem, Oregon. The key word in our name is "network." We are here for anyone who has an interest in actively networking with others interested in Atari computers. (It only works as well as we all make it work together, folks!) The #1 benefit of membership in ACUNet is tapping into the knowledge and talents of one another -- at our monthly meetings, via BBS, in our newsletter, one-on-one.

Annual dues are $15 with an AIM subscription and $10 without. Our meetings are held the fourth Tuesday of the month at 7:00 p.m. Call Ron Purdy, ST Co-Chair at (503) 588-7509 for the current meeting location and other information.

Local BBS support includes the Atari SIG on the Salem Public Library BBS - (503) 588-6130, Page BBS - (503) 363-0171, and The Jungle BBS - (503) 393-4274. Want more information about ACUNet? Write to Ron Purdy, 2662 East Nob Hill Drive SE, Salem, OR 97302.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President	Phil Rominger
Vice President	Bob Ribortone
Secretary	Matt Matias

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at 127 Pinnacle Rd., Bristol, Ct. 06010

Prospective members may call Rich Scheidel (203)589-3738 or call Gary Jones (203)225-4611, or write, CCCC, 127 Pinnacle Rd., Bristol,Ct. 06010.

Dues are $25 per year,$30 for families. Includes Voting membership, Atari Interface magazine, access to Club library (8-bit and ST) and access to the Club magazine library.

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held four times a year on a quarterly basis and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, N.Y.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST disks are priced at $2 while the XE library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members as well as members to visit a meeting and share ideas.

President	Bob Thompson	518-439-5356
ST VPresident	Joe Pasquini	518-426-3509
XE VPresident	Ian Herrick	518-432-8513
Secretary	Bill Crowley	518-371-0416
Treasurer	Joe Bogaard	518-785-4071

CRAG Calumet Region Atari Group

CRAG—Calumet Region Atari Group, PO Box 10995 Merrillville, IN 46411, is a club for users of the Atari ST, STE, and Mega ST computers. CRAG meets on the second Wednesday of every month at Broadway Music, which is located in Greentree Plaza, at 1509 W 81st (US 30), Merrillville, IN. Meetings begin at 7PM.

Membership in GRAG is open to anyone. Dues are $15 a year and entitle you to a subscription to Atari Interface magazine, as well as discounted prices on CRAG's Public Domain/Shareware library disks. Library disks are double sided. Cost per dis is $2.50 for members, $4 for non-members. For more information call:

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

The GTAUG has been 'around' since 1981 and supports both the 8-bit and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

Long Island Atari Users Group

Long Island Atari User Group, PO Box 92, Islip, NY 11751. For information, contact John Aalto at 516-589-6754 or call STar Scan BBS at 516-399-4252.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:

MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696.

Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari User Group (MAUG)

MAUG meetings have returned to A&B Computers, 1151 Park Avenue West, (West Park Shopping Center) Mansfield Ohio, from 7:00pm until 9:00pm, on the third saturday of each month (except July). If you are unsure on how to get there, call A&B at (419) 529-9999. If you have questions relating to MAUG, call Chuck Steinman at (419) 529-2478 (after 5pm).

ST and 8-bit downloads for MAUG members have returned to the DataQue Support board, so check them out! Included are the most recent AIM ST and 8-bit disks of the month, and other interesting files. Only MAUG members in good standing have access to these files, so make sure your have your dues paid! The DataQue support board runs 24 hours, 300-2400 Baud, and the number is (419) 529-5197. Make sure you indicate you are a MAUG member so that MAUG access will be granted.

General topics of discussion at the montly meeting are the contents of the AIM disks, recent news and events. Of course demonstrations of new hardware and software are appreciated!

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle Georgia area. We are composed of 43 members of which approx. half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The MGAUG address is 115 Feagin Mill Rd., Warner Robins, GA 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $6 with the newsletter optional. Use of the club library is free to all paid members.

O-ACEs

O-ACEs is a non-profit group interested in getting more out of Atari computers. We are NOT affiliated with Atari Corp. or any other commercial organization -- we are there for YOU! We cover BOTH 8-bit (including the 400/800, XL, XE, and XEGS series) AND 16-bit (ST series) Atari computers. We meet twice each month (except November and December) on the 2nd and LAST Wednesday each month. Doors open by 7:30 pm at La Vista Recreation Center, 8116 Parkview Blvd. (just off 84th Street, south of Food-4-Less and east of 84th at the light)

FIRST MEETING: (2nd Wednesday) Covers news, views, and decisions that ALL members might be interested in. FOCUS MEETING: (LAST Wednesday) Concentrated information on a single topic (such as word-processing, spreadsheets, music composition, desktop publishing, etc.) Call 592-5427, for more info on O-ACEs!

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9 to noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

Rushi asts

9512 A Adams Dr. Ellsworth AFB, SD 57706

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the fourth Saturday of each month, 2pm, at the Rapid City Public Library. Annual dues are $12 for basic membership and $15 for membership and newsletter (subscription to AIM!). RACE offers the Black Hills Atari owner hardware and software support and the largest library of public domain Atari software in the State of South Dakota.

NO PIRACY WILL BE TOLERATED AT ANY RACE FUNCTION!

S.A.G.E.
SPECTRUM ATARI GROUP of ERIE

SAGE, PO Box 10562, Erie, PA 16514-0562

The Spectrum Atari Group of Erie, PA was founded in December of 1984 to provide communication and support among owners of all Atari computers. Our newsletter is the SAGE Scroll which is published monthly. In addition to being distributed to all of our members, the Scroll is exchanged with over 50 other Atari computer user groups nationwide. SAGE maintains extensive libraries of public domain software for both the Atari 8-bit and ST computers.

The Spectrum Atari Group of Erie meets on the third Sunday of each month at 2 PM at St. John's Lutheran Church in Erie, PA. We also have SIG meetings monthly covering Telecomputing, the ST/Mega/TT computers and programming in GFA BASIC.

President	Dennis McGuire	814-833-4724

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
Steve Traxler	Vice President
Gary Lentz	Sec/Tres/Librarian

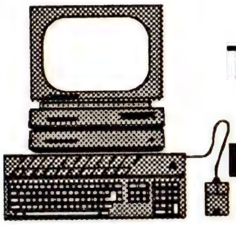
TEAC
The Educator's Atari Club

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

TACE
TINKER ACE OF OKLAHOMA

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649



THUNDER BAY ATARI ST ENTHUSIASTS

TASTE--Thunder Bay Atari ST Enthusiasts was formed in October, 1987 by a core of 5 ST owners interested in forming a user group to help each other and to help in publicising the Atari 16bit machine.

We grew fairly quickly to an all-time hig of 20 members by January, 1990. A monthly newsletter was published, and we established a PD library. Soon after, membership began to decrease -- members were getting to know their machines better, and lack of interest in publising a newsletter. We still have our PD library of about 70 disks, and will be adding to the list as we go along.

Thunder Bay is a city of 113,000 located on the norther shore of Lake Superior. We have one Atari dealer; is his also a dealer for the Amiga and IBM clones. Needless to say, the priority for Atari products is the lowest. We manage to stay alive monthly by mail order purchases -- unfortunate by necessary.

President, Neville Denetto, 185 Varsity Row, Thunder Bay, Ontario, Canada P7B 5P2.

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM, as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WACO also operates the WACO Ward BBS, 300/1200 baud. The club was founded to help Atarians support each other. One of the regular features of each meeting is called "Upload" when members share new information or ask for assistance in solving questions. Both 8bit and ST disks-of-the month are demoed as well as new hardware and software.

Since the first Taricon back in 1984, WACO has been represented at most of the northeastern Atari shows as well as having a booth at all Pittsburgh shows.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

WAUG

Windsor Atari Users' Group

The Windsor Atari Users' Group (W.A.U.G.), founded in 1982, is among the oldest computer clubs in North America to serve the Atari community. We are an international family of Atari owners with members from across Southwestern Ontario and the state of Michigan.

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'. In addition, each membership gives you access to our ever growing public domain library, packed with programming from around the world. Each club disk sells for $4.00 (Canadian) with the occassional monthly special as offered by our club librarians.

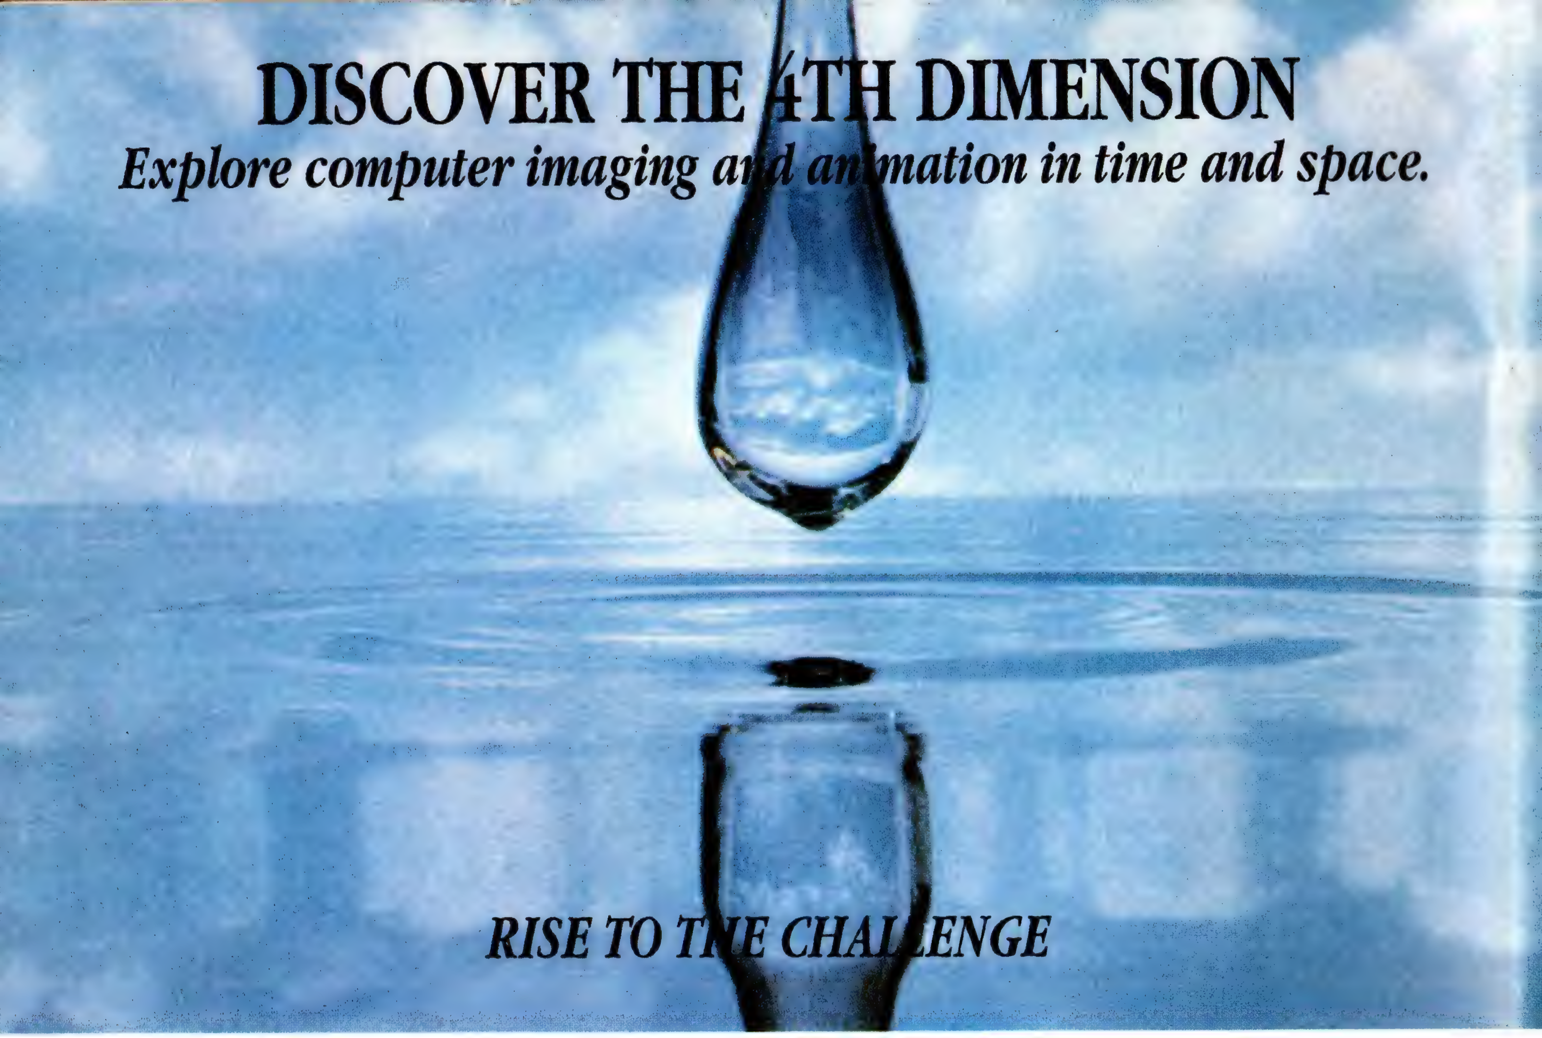
DISCOVER THE 4TH DIMENSION

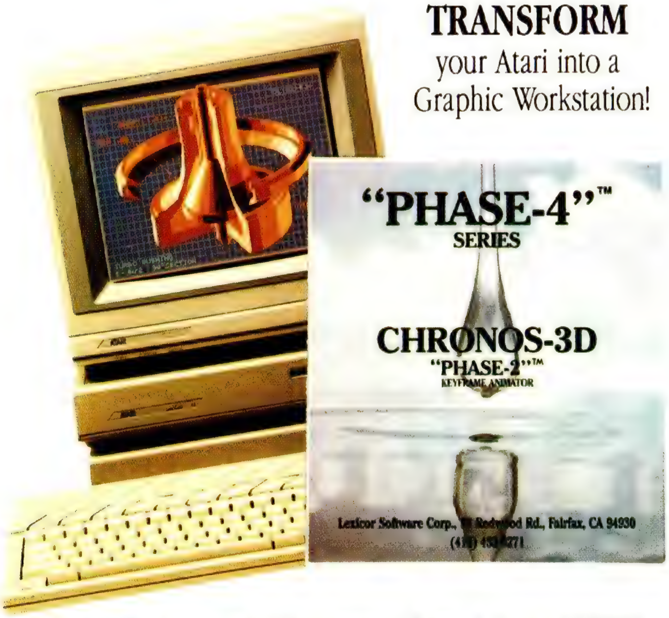
Explore computer imaging and animation in time and space.



RISE TO THE CHALLENGE

Chronos Key Frame Animator; creates a rich new environment for the computer animation enthusiast. Cut, copy and paste time and motion. View solid 3D objects in the past, present and future.

TRANSFORM
your Atari into a
Graphic Workstation!

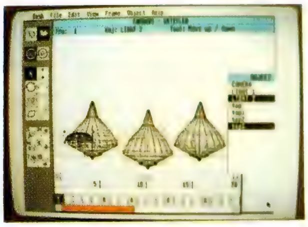


CHRONOS KEY FRAME ANIMATOR

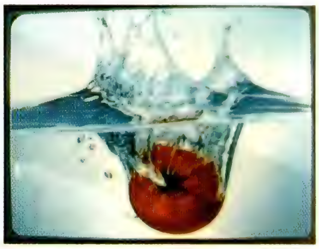
Object Motion Control Software Application

CHRONOS –

"The right program at the right time for the Right Computer". Now a flexible problem solving environment which totally eliminates the need for program control codes. Fully mouse driven system with keyboard support.



Unlimited Object complexity with no object face and point restrictions.



Create P.I.X.A.R. compatible files for Professional Graphic applications.

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs is preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

EDITORIAL RAMBLINGS

THIS ISSUE OF Atari Interface puts us back on track with both stores and clubs! It was hard getting back in step once we were out of synch, but we did it. The only delay now is in the mailing process, and we did some checking into that recently.

As some of you may recall, we asked our readers about spending money on improving the magazine or upgrading to second class mailing. The overwhelming response was to keep improving the appearance and content of the publication, which we will keep doing. A few voices were raised in support of going to 2nd class—mostly from clubs and readers on the east and west coasts. Well, come to find out, since we offer such a discount to the clubs who participate with AIM, we've all but tied our hands when it comes to second class mail.

According to US Postal regulations (we got to read the whole exciting chapter on 2nd class mail!), we would have to get a form from each and every member of each and every of our 80 clubs stating how much club membership dues were and how much of that was sent to us each year. The US Post Office states that it is preferable that all subscriptions be signed up with us directly. Because about 2,500 copies are sent to members of clubs at what the Post Office considers a "nominal fee," we can't go to 2nd class mailings without forms from everyone.

However, we are willing to offer the service of mailing the magazine to readers by 1st class mail. This, of course, costs more—an additional $2 per magazine (see our subscription form for more details). You would get the magazine a bit faster each month, plus it would be sent in an envelope, and some people have complained about their issues being a little worn by the time it reaches their mailbox. This may not be for everyone, but we want to offer this service for those to whom it makes a difference.

One last thought: if you move, the Post Office will not forward your 3rd mail unless you tell them you're willing to *pay* them to do it. So, be sure to get your new address to your officers or to us as soon as you know it! Also, clubs may wish to get a few extra copies each month if they aren't already doing so. This gives new members something to read until their subscription starts, and covers those people who lost an issue in the mail for whatever reason.

Bill & Pattie Rayl

From The Reader's Viewpoint

SyQuest Backup

No bout adoubt it, Atari users are happy with the SyQuest 44. SyQuest is aware of that satisfaction, and the company seems willing to provide all support required to increase the popularity of their products.

My interest in the SyQuest SQ555 Removable Cartridge Disk Drive is diverse. At Machine Specific Software, we are developing programs to copy entire partitions between fixed and removable drives, in all combinations—that is, fixed to fixed same/different drive, cartridge to cartridge same/different drive, fixed to cartridge and cartridge to fixed. Our programs are best suited for backup and reorganization.

We have attained copy speeds of 16 megs/minute partition to partition on the same cartridge, 21 megs/minute between partitions on a Maxtor 210 megabyte, 18 megs/minute between the Maxtor and SyQuest cartridge and 14 megs/minute between a Seagate 251-1 and cartridge.

We verify the correctness of the copy with a compare algorithm that executes at speeds between 9 and 12 megabytes/minute with a CPU clock speed of 8 megahertz.

In addition to the basic program, which copies between partitions having fixed logical sectors of 512 bytes, we have an enhanced version which copies between partitions having identical sector sizes up to 8192 bytes.

A third program copies data between partitions having differing logical sector sizes. All programs are in final beta test. You can express your interest by writing to the address below.

Robert C. Arp, Jr.
Machine Specific Software

Late Issue

I know that you are receiving some flack about being late. Those who are criticizing obviously don't know what is involved in putting out a professional magazine, especially with as little help as you must have.

I want you to know that we in AAAUA are solidly behind you and hope that you don't become discouraged. Hang in there and do the best you can. While I am sure you are in this to make a dollar, you are also carrying a moral banner. A banner that many others did not have the fortitude or loyalty to carry. You have a *great* idea. Don't let it die!

We have been receiving both the ST and 8-bit PD disks for which we thank you. They are great!

Alvin Sherrill (AAAUA)

SOFTWARE PIRACY
hurts
BIG companies.
But it KILLS
small companies.

Have you ever heard this rationalization for stealing? "Big software companies aren't hurt by one or two pirate copies of their programs."

Well, the truth is that many of the best Atari software houses are NOT big companies -- they're small businesses with few employees. Many of the best programmers and developers are Atari enthusiasts like you. And the loss of just a few sales due to software theft can help drive them out of this comparatively small market.

The next time you're tempted to give or receive a copy of a commercial program, consider how piracy affects Atari software developers and the future of Atari computers.

THE IAAD Independent Association of Atari Developers

ATARI BULLETIN BOARD

Atari News

Bob Brodie has a new title! As "Director of Communications," Bob is now in charge of PR and ad placements for the computer division. This is an extension of his past responsibilities as Manager of User Group Services.

You can be sure that Bob will continue his appearances at shows and user group get-togethers, but now he has the chance to work some of that "Brodie Magic" in a wider arena.

Congratulations, Bob, on a well-deserved "promotion."

The Atari Portfolio made its big screen debut in the smash hit movie Terminator 2, Judgment Day. The Portfolio serves a crucial function in the movie, contributing to the saving of the world. Although not blatantly displayed, the Atari name does (mostly) get shown on-screen at least once in the movie.

Not to be outdone, STs have been appearing in some recent TV episodes of Growing Pains, The Flash, Night Court, Working Girl, etc.

The Atari TT030 is going to be used for creation of graphics and animations for the SFA-Network, a science fiction cable channel that should (hopefully) be available near the end of 1991. Atari has reportedly delivered one TT to SFA-Network and a Mega/STE to the channel's spokesman, Walter Koenig (Star Trek's Chekov).

Mike Kelly, President of SFA-Network says they are looking for artists and animators familiar with the ST and TT computers. Give 'em a call at (512) 440-1092 for details on how and what to submit in the way of a "portfolio" if interested.

Plans for Atari to open a production facility in Israel have seemingly fallen through. According to the July 25 issue of the San Francisco Chronicle, "Atari Corp. has canceled plans to build a $53 million computer plant in Israel because of government bureaucracy, Israeli officials said." Atari is currently using contracted builders, having sold their Taiwan factory a few months ago for $60 million.

Developer News

Andest Communications of Milton Keyes, England has released a pocket modem for the Portfolio. Andest also has a telecommunications program for the Portfolio that supports VT52 and VT100 emulation, as well as Kermit, Xmodem and ASCII file transfers. The modem is currently being bundled with the Portfolio in the UK.

PageStream 2.1 has shipped to owners who took advantage of the $75 upgrade deal. The new version features the ability to print Type 1 Postscript fonts to ANY printer, easy "bleeding" of text and objects within a user-definable bleed area, real CMYK color definition and much more.

Retail price is $299.95 and owners of PageStream 1.8 can upgrade for $100. Call Soft-Logik at (800) 829-8608 for more information.

Maxwell CPU is selling Silhouette version 1.0 for $69.95. Silhouette is a graphics manipulation/paint program with many unique features. One of its most prominent features is its "Autotracing" capabilities. Silhouette supports GDOS and Atari's soon-to-be-released FSMGDOS fonts, and the software can load IMG, DEGAS, TNY, MacPaint and GEM formats. Graphics can be output in IMG, GEM or DXF (CAD) formats.

Maxwell CPU, PO Box 576, Louisville, CO 80027, (303) 666-7754.

Lexicor Software and CompuServe's Atari Forums have begun the long-awaited online animation classes. Classes are held each Saturday at 5PM Eastern in the Lexicor conference room of the ATARIVEN Forum.

The classes include lectures and homework assignments for specific topics, with lecture text and files for all classes available for download.

Innovative Concepts of Warren, Michigan is having a "Super Summer Sizzler Sale" until September 31. The list of 8-bit and ST hardware and software on sale for fairly attractive prices would fill a few pages of this magazine! And some of the stuff they're selling is pretty hard to find.

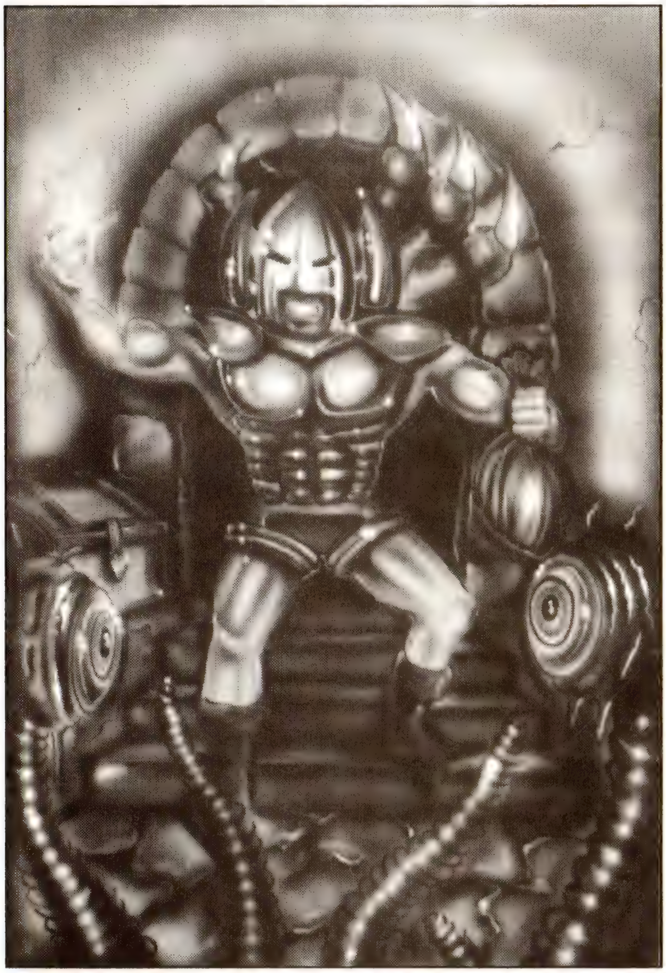
For a complete list, download their file from CompuServe, GEnie or their BBS (313) 978-1685...or contact Innovative Concepts at (313) 293-0730. If you're an 8-bit owner, you'll be sorry if you miss this sale!

The "Summer Savings Issue 1991" DAMARK catalog has the Atari SX212 modem for sale for only $19.99!

This 1200 baud Hayes-compatible modem comes with SIO cable for connection to the 8-bit Atari. The SX212 also has a standard RS-232 port for connection to the ST or other computers. To place an order, call DAMARK at (800) 729-9000 and ask for Item #B-374-181504.

A new game for the Atari 8-bit is due to be released in September by Aerion Software. Titled "FURY: The Wrath of Taijun Cathu," photos we've received of this game look *great!*

The game features five "worlds" with 20 "rooms" per world. On each level, you must defeat the "keeper of the key" in order to enter the room that gives you passage to the next world...but, beware of the "guardian of passage" in each room! Along the way, you pick up treasure chests, coins and food. A shop on each level lets you spend that hard earned money to buy better weapons and health points.



Aerion Software Ltd., PO Box 1222, Riverdale Station, New York, NY 10471.

Another new release for the 8-bit Atari are the ChromaCAD 3-D Model Builder and Surface Shader XE packages from Palette Imaging. Some of the results from this software is very impressive. (See the ad from Palette Imaging elsewhere in this issue.) The sofware is available *now*...in fact, we have a copy of both packages. At $29.95 each, these packages are a steal.

Palette Imaging, 1 Closter Commons STE 789, Closter, NJ 07624-0400, (201) 767-3913.

David Plotkin
Contributing Editor

There isn't really any reason why the ST can't have a multi-tasking operating system. There is no inherent limitation in the processor.

I can't wait for the day when the ST can do true multi-tasking.

What multi-tasking refers to is the ability to run multiple programs at once. What distinguishes true multi-tasking from "context shifting" is that, with context shifting, you have multiple programs loaded at one time, but only one is running.

When you switch to one of the other programs (usually via some kind of key-press sequence), the program switched away from stops dead in its tracks. Nothing is lost (if context switching is implemented properly), but if you were in the middle of recalculating a long spreadsheet when you switched away, you are still there when you return to the spreadsheet program.

Context switching is handy, and there are a number of programs that allow it. The ones that come to mind are Juggler and Revolver. Both work by partitioning your ST into "virtual machines." Each partition thinks it's the whole machine.

This can work so well that you can actually crash one of your partitions and still have the other ones work (although I don't recommend proceeding this way). Of course, the memory in your machine must also be partitioned between the applications. Thus, running Juggler or Revolver on my 4-meg machine results in four 1-meg machines.

There are some inherent problems with context switching, however. The first is that the only program running is the currently active one. This isn't a big problem until you consider that one of the most time-consuming things that some people do is download files from a BBS.

Switching away from the telecommunications program stops that process, usually breaking the connection after a short while. Also, with the partitioning scheme, you will never be able to cut information from one application (in one partition) and paste it into another. Of course, a multi-application cut-and-paste clipboard has never been fully supported on the ST anyway. This is too bad, as it is one of the most useful features of the Macintosh.

Multi-Tasking Done Right

True multi-tasking allows multiple programs to run at the same time—often in their own windows on the screen. With multi-tasking, you can start a lengthy download, then go work on some other task.

A properly designed multi-tasking environment usually supports a multi-application clipboard, allowing cutting and pasting of information. This can be implemented even when the application in question doesn't support clipboards at all!

For example, Windows 3 on the PC allows you to cut information from a DOS application or window, which it then stores in a buffer. When you go to some other application (including another DOS application), Windows can paste the information in by loading the stored buffer into the keyboard buffer one character at a time. It's kind of eerie to watch your PC type the information in all by itself!

What About the ST?

There isn't really any reason why the ST can't have a multi-tasking operating system. There is no inherent limitation in the processor (the Amiga uses the same processor, and it *does* multi-task, as does the Mac with the advent of System 7). On the PC, the 80x86 line of processors couldn't really multi-task without special help until the advent of the 80386.

But the 68000 can. It won't be really snappy, because the chip is aging and, by today's standards, isn't very fast.

Still, you could upgrade to one of the accelerated chips available to improve performance.

The magic for multi-tasking is in the operating system. GEM is not a multi-tasking operating system, so something else would have to be built. That "something else" may be Rimik's MultiGEM, which I have yet to see, but have heard good things about. From the descriptions, it does most of what a multi-tasking operating system should, including allowing TOS programs to run in a window (much the way Windows 3 allows DOS programs to run in a window).

Why Multi-Task?

Once you have tried multi-tasking, you are spoiled for life. This may not be clear to you until you have tried it—for years I couldn't imagine why anybody would want to multi-task. After all, I can only do one thing at a time. Why should my computer be able to do more? This seems rational until you think about your everyday life. *You* may not multi-task, but with the help of the machines around you, it can seem that you do. You throw the dirty clothes in the washing machine, flip on the fan in front of the window and go start dinner. Are you multi-tasking? Well, there are three tasks going on at once—the clothes are getting cleaned, the house is getting cooled and the dinner is getting made. You figure it out.

Multi-tasking is especially useful in a work situation, where someone can walk into your office at any time and ask for something. Instead of shutting down whatever you are doing, you just start the program that lets you answer the question, then go back to whatever you were doing. No muss, no fuss. It can get very addicting.

The down side of multi-tasking is that no matter how carefully the operating system is programmed, some programs are going to break. This is especially true of programs that "break the rules." With Apple's System 7 (the first true multi-tasking operating system for the Mac), quite a few programs "broke" and updates had to be rushed out for them. Why, even our beloved Spectre GCR broke when System 7 came out.

Another good example of the difficulties of writing a multi-tasking operating system that runs with "normal" programs is Windows on the PC. Even with Windows 3 (where Microsoft had three releases and six years to get it right) there are programs that absolutely refuse to run.

This difficulty is accentuated on the ST, where not only do many programs break the rules, but the software companies that wrote them are either gone or no longer interested in supporting the ST. Can you imagine Timeworks updating Publisher ST to support MultiGEM? Still, it would be wonderful to have the option for the many programs that would work. Ideally, you could choose to run the multi-tasking operating system or not, just as you can choose not to run Windows on the PC.

See you next month!

Make your Atari FAST!
WARP 16 FAST!

The WARP 16 accelerator + cache board contains a high speed 68000 CPU that replaces the slower 68000 CPU currently used in your Atari.

By taking advantage of the large amount of high speed cache ram on the WARP 16 board this CPU is able to run programs at twice the speed of an unmodified Atari.

Routine tasks such as spellchecking, spreadsheet calculations, screen redrawing, and laser printing take a fraction of the time they used to.

No longer are you frustrated by waiting for your computer.

WARP 16's custom logic allows caching of both reads and writes AND caching of both "byte" and "word" memory accesses.

What does all this mean?

Your Atari moves FAST! WARP 16 FAST!

Features:
- 16MHz CPU accelerator with cache for all Atari ST/MEGA computers.
- 80K of high speed static ram. Organized as 16K cache-tag ram + 64K cache ram.
- FOUR TIMES MORE cache ram than any other Atari accelerator on the market.
- User selectable "stock ST" mode gives 100% compatibility with ALL Atari software. Even Spectrum 512.
- For use with Atari ST, MEGA, and STACY computers.
- STE version available soon.
- Don't settle for other upgrades that offer tiny amounts of cache ram, or offer compatibility with 80% of existing software.
- WARP 16 offers a full 64K cache + 100 percent software compatibility.
- Dealer inquiries welcome.
- Order your WARP 16 TODAY!

WARP 16 **$349.95 (U.S.)**

Add $4.50 for shipping and handling. Note: WARP 16 requires installation by a qualified computer technician. This installation may be done at your local computer repair shop. Call us for details.

Diamond Back II

Simply the **FASTest**, easily the most **FLEXIBLE**, and absolutely positively without question the most **RELIABLE** hard disk backup and restore program for the Atari ST!

- EASY to use 100% GEM user Interface ▼ Online Help
- Point and click to select specific backup paths and files
- Backup/Restore ANY number of specific files or paths
- Creates 100% normal TOS files! ▼ Full/Partial Restores

- Flexible include/exclude wildcards for backup/restore!
- Incremental backups ▼ Load/Save Configuration files
- Compression & Encryption ▼ CRC Validation Logs

Extra Special Features:
- Backup/Restore **Spectre** partitions! ACK & 3.0 OOP
- Intelligent Image option only backs up sectors w/ data!!
- Incredibly fast hard disk to hard disk backups!!!!!
- Full support for TT and 1.44M High Density Floppies

Same low price: $44.95
Upgrades to Diamond Back II V2.26 are only $5 from any version 2.20+ or only $10 from any version 2.11 or before(w/new manual).

MIST III Show Report

Patricia Snyder-Rayl

COMPUTER WORKS
MIS

Looks like there's just enough time to squeeze in a report about the recent MIST show before we send the magazine off to the printer, so here we go!

The third annual MIST show was held in Indianapolis, Indiana the weekend of July 27th and was a good little show! The three clubs hosting the show obtained a large conference area with a large room for vendors/developers, a smaller room for club displays and a good-sized seminar room.

Seminars included talks about Lexicor's Prism Paint and Chronos by Bill Rayl, Editing with EdHak by Craig Harvey, and CompuServe and Telecommunications with Bob Retelle. The folks at MegaType showed off their fonts and, to top it all off, there was a special talk by Atari's Bob Brodie.

Bob Brodie's table was featured prominently among the 21 different vendor booths. These included Atari dealers One Stop from Chicago, Randall's Home Computers from St. Louis, Computer Works from Carmel, CAL COM from Kokomo and Mars Merchandising from Chicago.

Vendors

Hardware-oriented companies were represented by ICD, Inc., Touch Technologies and AT/Com Electronics. Graphics-oriented companies at the show were Wiz Works, M-S Designs, MegaType, Electronic Spinster Graphics and SKWare One. Application-oriented companies included Soft-Logik, Gribnif, MP Graphics Systems (representing ISD), Clear Thinking, DA Brumleve and Apprentice Software, leaving only the CompuServe and Atari Interface booths in the miscellaneous category.

Cin'tari, LCACE, STar, EAUG and MAST—as well as the three hosting clubs ASCII, BLAST and PAUG—all had booths showing various PD/shareware programs and graphics demos.

I know many other clubs were represented in the crowd of showgoers because I got to meet quite a few of 'em! One gentleman from BRACE (KY) introduced himself, and I saw people from the SAGE and WACO (PA) clubs, too.

The official estimate had about 275-300 people attending this one-day show, with attendees coming from Kentucky, Illinois, Missouri, Michigan, Ohio, Pennsylvania and probably more states!

Booty!

Door prizes included products for the TT to the Lynx! Atari donated a Migraph Hand Scanner with TouchUp and six sets of TOS 1.4. ISD gave away Calamus, Outline Art and a Guide to Calamus Desktop Publishing. Soft-Logik donated a copy of PageStream 2.1 and two copies of Font Pack 1, Font Plus Pack and Business Forms. Other font packages contributed included fonts from Sol Gruber and M-S Designs Multi-Font Pack (with 34 different fonts).

MissionWare gave away a copy of LottODDS and their Printer Initializer, Kyle Cordes contributed three copies of his Abbreviator ST and DA Brumleve donated a copy of KidPublisher Professional. Clear Thinking offered EdHak, SKWare One gave away Seurat and Computer Works donated two arcade games. MP Graphics Systems supplied DynaCADD and AIM gave away two copies of the August issue and an ST and 8-bit Disk of the month. Current Notes donated a subscription to their fine magazine.

Vendors were happy with the show. ICD sold out of several product lines they brought. Clear Thinking did better at the MIST Show than at either single day at the Windsor show, according to Craig Harvey. Bob Brodie said his hand was still attached to his arm at the end of the day, so it was a good show! I asked him if he sold lots of product, and he laughed because he wasn't selling anything at his booth, just sharing good will! Bob Retelle said he "sold a lot of CompuServes." Talk about high finance! I wonder how H&R Block feels about that? (grin)

All the vendors I talked to expressed satisfaction with this seven-hour show. M-S Designs had some technical difficulties though. They were having trouble getting their "souped-up" ST enough power from the lines to work, but this was the only glitch spoken of at the show.

Impressions

As for Bill and I, we had fun talking to a lot of people from clubs participating in the magazine. We sold a bunch of disks and a whole pile of magazines.

There didn't seem to be a lot of 8-bit users in the crowd, but those who were there were very happy we now had an 8-bit Disk of the Month for them.

Officers of the three hosting clubs said later online that they're trying to get the St. Louis clubs involved in having a show next year. Let's wish them the best of luck, and with MIST's sucessful track record, it's sure to be a hit!

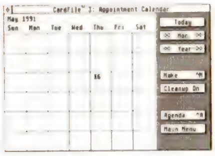
CardFile™ 3

Personal Information Manager

CardFile™ 3 is the complete personal information manager for your Atari ST.

With CardFile you can create easy to use Rolodex® style address books and phone lists.

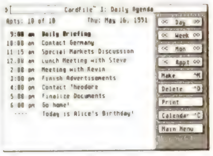
A powerful and intuitive *Filter* function lets you instantly find any name, address, or phone number. Or it can even find a group of cards that match any particular information you want.



```
May 1991
Sun   Mon   Tue   Wed   Thu   Fri   Sat
                         16
```

Its powerful built-in calendar can keep track of all your appointments, meetings, and important dates. Call up any day and plan out your agenda.

CardFile's Daily Agenda feature will remind you of any upcoming appointments for the next two days when you turn the computer on in the morning. There's even an option to print a daily or weekly agenda.



```
Apts: 10 of 10          Thu: May 16, 1991

 9:00 am  Daily Briefing
10:00 am  Contact Germany
11:15 am  Special Markets Discussion
12:00 am  Lunch Meeting with Steve
 2:00 pm  Meeting with Kevin
 3:00 pm  Finish Advertisements
 4:00 pm  Contact Theodore
 5:00 pm  Finalize Documents
 6:00 pm  Go home!
  ----    Today is Alice's Birthday!
```

CardFile is very convenient. It runs as either a desk accessory or program. Its data is easily imported by most programs and it will even type an address directly into your word processor.

It will print address books, phone lists, and mailing labels. Add a modem and it becomes an autodialer!

So You Want to Start a User Group? Part II

A Primer for Starting Your Own User Group

Tim Holt
Contributing Editor

Last time, we discussed how to go about seeing if you need a user group in your area. Hopefully, you decided to take the big plunge. You checked the BBSes, you asked your friends, you asked at the local computer dealer and you decided that a group is just what your area needs. Now we will look at how to obtain the most important thing any user group needs: *members.*

As soon as you decide to start a user group, there is something you must be warned about—you are going to have to dump some of your own money. How much you spend is up to you, but expect to spend at least $25 to "get the word out."

In terms of getting the group off the ground, it is truly money well spent. Run off a few flyers with information about your group. This is very easy with any DTP program. It doesn't have to be great, just informative.

(Just a note: If you are starting an *Atari* group, make sure the Atari logo is displayed very prominently in your flyer. Same goes for *any* type of logo that is associated with your club.)

Your flyer should include, *at least,* meeting time—When you are meeting; meeting place—Where you are meeting; contact person—Someone folks can call for more information.

The flyer doesn't have to be a work of art, but it should catch the eye of anyone passing by... You have to let the world know that there is a new user group out there. Go to where the computer users are!

Post the meeting times and information about your group on every local BBS. It doesn't matter if the BBS supports your computer or not. Chances are someone on that BBS knows someone with your computer that doesn't have a modem, and will pass the word on. He or she will in turn pass it on and so on.

Ask permission to post a flyer in all local computer stores. Everyone hates to ask strangers to do something, but I have found most store owners are willing to let you post info if you ask politely. Expect some anti-Atari sneers—it's part of the game.

Some might even let you put up a little bulletin board in a corner somewhere in the store, where club info can be posted. If a store owner does *not* let you place club info in his store, don't be offended. (Just remember him when the club really gets some membership going...he he he...)

Atari specific or authorized stores should even let you place some flyers on a counter or in a bookshelf somewhere, where prospective members can pick on up and take it home. Explain to the owner that your club can help him as much as he can help you. Chances are, you are already friends with the dealer.

Look for unusual places to post information. Are there bookstores that sell Atari Explorer or Current Notes, or AIM? Ask the manager if you can place a flyer by the magazine rack. Want to be real bold? Ask the manager if you can place flyers *in* each magazine! This is a great way to grab someone's attention. And do not limit it to Atari specific publications! Many Atari users pass up the Atari mags and head right for the Computer Shopper, etc.

Place a flyer in the local libraries. Most libraries have a "Community Calendar" type board. Place a flyer at the site where you are going to meet. Place a small classified ad in the Computer area of the classified ads in your local paper. Place an advertisement in the local community college or university paper. (This usually is real cheap advertising: 10 cents a word!) Post a flyer in the computer science or math department of your local college.

Let the local newspaper know about your group. Let the local radio stations know. They usually have a community listing of groups. The radio stations *have* to list the groups as part of their FCC licencing agreements. Its called "Community service". Local TV stations often broadcast community meetings as well.

The point is, no one will post your information if they don't know you exist. Let everyone know. Some will help, some won't. I am sure that you can think of many more places to let the word be known about your club.

Okay, the big day arrives! Prospective members come to the meeting. Now what?? Well, the easy part is getting the members, the hard part is keeping them.

You and your officers must decide on what things you will *give* members. That's right: *give* the members. From my experience, after the folks plop down the membership dues, they expect a song and dance, with a little magic thrown in for good measure. A small percentage of the membership will help you out (take good care of those folks, they are few and far between). The rest want entertainment. It's up to you to do that. So, here is a little list of items designed to keep the natives happy. After all, you have their money... what are you going to do with it?

A Club Library

How much PD stuff do you have? Good, it now belongs to the club. Gather as much as you can, copy it onto disks, keep a list of what is on each disk. (The local dealer should have a nice selection. *Grab it*! Nicely of course.)

This is one of the most important parts of the club. People have come to *expect* a club library. There is a major need for a club librarian here. Remember, as leader, you need to spread the roles around.

Let me digress for a moment with a word of warning: *please* do not let your librarian make the club library his own private collection. The library belongs to the *club*. Buy the disks to copy, the labels, etc. Our club made the mistake of accepting the offer of someone to let his private PD collection be the club's library. When he got mad at someone else in the club, he decided to regress into childhood and took the *entire* library with him. We haven't seen hide nor hair of him for about 15 months.

Needless to say, we had to rebuild the library from scratch. Lots of hurt feelings, lots of bitterness because we let a private collection be the library. Be sure that you always distinguish what is the club's and what is

not. The library can contain any public domain program, shareware, freeware or demo that is produced by a company. The library *cannot* contain *any* commercial programs, *even* if the company no longer supports your computer.

Discounts from Computer Stores

Local computer stores usually will offer user group discounts of anywhere from 10 to 25%. Don't press the issue if you don't get the discounts you want. Remember, dealers have a greater profit margin on software than on hardware, so you may not even get a hardware discount.

Let's say a member spends $20 on membership and gets a 10% discount on software at Bob's Computer Stand. If the member plans to spend more than $200 on software in during his membership period, he will recoup any money spent on the membership. Essentially, he gets his membership for free! This is an excellent selling point!

Discounts on Local Products/Services

If there is a member of your club that owns a business, ask if you can offer the club members a discount on his services. In the past, our club has offered discounts from plants to car tune-ups from various members in our club.

Discounts on Atari Publications

Current Notes, Atari Interface and ST Informer offer discounts to members of official Atari user group that are registered with them.

Giveaways

Door prizes are a great way of getting folks to show up. The prize can be *anything,* but traditionally, software is a good way to go. Ask your local dealer if you can get a program *at* his cost. Then you don't spend so much on door prizes. Members may even offer old programs that they no longer use, and are just collecting dust.

The giveaways don't even have to appear to be Atari-related. In the past, we have given away books on MIDI and recordings by groups that use the Atari, like Tangerine Dream or Fleetwood Mac.

You might make the giveaways even more spectacular at the holiday time. Of course, the type of giveaway is directly related to the financial situation of the club. (I told you that you might have to dump some money early.)

Auctions

Every six months or so, have a club auction, and let members sell the old unused items that are just collecting dust. Our local dealer, Jenkins' Computers, loves the idea. As soon as the auctions are over, everyone tramps over and buys things from them.

Here is how we do an auction: Members must bring original Atari-related products, and then we, the club, auction them off. (We have had some humdingers of bargains too, like Timeworks DTP for $15!!) The seller must pay the club 10% of the final selling price.

So, the seller gets 90% profit, the club gets 10% and the buyer gets a new toy. We have been very successful with these, and you should too. However, you had better advertise these as you did the original club meeting! Let everyone know you are having an auction about one month in advance.

A Club Newsletter

Decide who is going to do this! It requires a lot of time and patience, plus someone who is good at desktop publishing. Most members will *not* write for the newsletter, so many times it becomes a one man show. (Online magazines like ST-Report and Z*Net are great sources of information for newsletters when the membership has word processor fright.)

This job becomes as much a time sucker as being the librarian. The newsletter should be mailed out at regular intervals—once a month, every three months, whatever.

There are a number of questions that have to be answered. Who will pay for making copies? How big will the newsletter be? (Hint: One stamp pays for a nice 18 page newsletter: 9 pages front and back.) Who will make copies? What if you have 100 members and an 18 page newsletter? That's a lot of copier time, plus a lot of money!

Newsletter are great for letting members that missed the meetings know what is going on, for advertising upcoming events like auctions and for getting info out about new products. Members really like to get newsletters, even if they are not professional-looking. I looked at the first ACCEPT newsletter—two pages, and half of one was clip art. The rest was a message from our president who flipped out. (See previous column.)

Reminders

Have one member be responsible for sending a postcard to or calling the members to remind them about the upcoming meeting. This should be done the week prior to the meeting, so those that forgot about the meeting can adjust their schedule. This lets members also know that you are remembering them. A nice touch, no matter how large your group becomes.

Get Togethers

You do not always have to have a computer in front of you in order to meet with your group. Have semi-annual get togethers at local restaurants, have picnics during the summer and do other *non-computer* activities. Who knows, you may actually make a friend for life! I have!

This month we looked at things to "keep the customer satisfied." Next time, we will look at what should actually happen at the meetings!

Folks visiting the Nation's capital ***should*** see the National Arboretum
the Senate Subway, the Washington Navy Yard, and

the largest Atari computer show on the east coast.

W•A•A•C•E

AtariFest '91

October • 12 & 13 • 1991

Sheraton-Reston Hotel

11810 Sunrise Valley Dr. Reston, VA 22091

user groups seminars vendors
software hardware swap room
desktop publishing demonstrations
door prizes midi games telecom
education entertainment utilities
applications ibm & mac emulation
business animation art graphics
developers programmers friends
bargains, fun & lots more...

Show hours are 10am until 5pm both days

Admission:
$5.00 for one day, or $7.00 for both days

For general information, contact Charles Smeton at 301-465-8628, or on GEnie mail as C.S. Smeton. For vendor information, contact John Barnes at 301-652-0667, or on GEnie mail as J.D. Barnes.

Telephone for hotel reservations: 703-620-9000

Hotel rates, which include FREE admission to the 'Fest, are $59 per night, single or double occupancy, and $66 triple or quad. These rates are valid from Oct. 10 through 13. State tax of 4.5 percent applies. In order to obtain these special rates, you must mention AtariFest '91.

AtariFest '91 is presented by the Washington Area Atari Computer Enthusiasts

Sex, Lies and Graphics/Video

(but without any sex or many lies)

Jay Craswell
Contributing Editor

[Ed. Note: This article introduces our readers to Jay Craswell, president of Dover Research and designer of the ISAC and ALBERT color boards. In future issues of Atari Interface, Jay will be sharing his views on color displays and other topics that strike his fancy. We think you'll find Jay's unique outlook and sometimes off-beat sense of humor refreshing.]

Ahh, another chance to write. When I think of the first thing I ever wrote for a magazine, I remember the astonishment of my dear Ma. Looking incredulous at the magazine (Atlantic Tech), she read aloud one sentence. "Did you really use this word?!" she demanded.

"Ah...yes," I replied. "Why, is it spelled wrong or something?"

"No." Ma said. "It's just that I didn't think you even knew that word!"

So now that you are forewarned of my limited talents in the world of writing.....

How it All Began

People are forever asking me where I got my "start" and I have had a tough time trying to explain it. Here for your amusement are some stories about my formative years as they concern electronics/computers.

One of my first experiences with computers was, of all places, English class featuring Mrs. Nelson. She was, to put it mildly, "quite a babe." Most of the male teenagers in her class were desperately in love with her. Personally, I was more interested in a flag twirler (I know, I still can't believe it) named Debbie who was about as far out of my league as you could get—blonde, beautiful, with one of those Farah Fawcett Hairstyles from Hell.

At any rate, thoughts and feelings about Mrs. Nelson teaching in the nude, etc., were pretty common to the male members of our class when our beloved teacher introduced us to poetry and computers all in the same day! Computers of this era were really primitive. When I say primitive, let your mind roam. Fred Flintstone-style 110 baud Teletypes were the order of the day.

Lucky thing we had Tom Hoyne! His ability to be talked into foolish and dangerous situations created a lifelong bond.

Our project was to sit in front of the terminal and type in responses to the computer. With me was Rob (whom we called Flob), full-time funny man who stated in third grade that his ambition in life was to create his own religion with himself as the Great Abba Sid, Master of time space dimension and owner of several Mexican restaurants (just in case). All of this so that his "Followers" would pay his way by "donating" their worldly goods and facial hair. In return, he would promise nothing. This, he was sure, he could deliver and thus no one would be disappointed. Also guest starring in this little tale was a shy boy named Kevin who, to this day, will not speak to me.

Anyhow, we sat down and the computer chugging away somewhere in MECC-land (or maybe Bedrock) spit out the fateful questions....

"ENTER A SEASON OF THE YEAR <bing>"

After heated discussion between Rob and Kevin, they entered 'SPRINGTIME'. Then the computer made its fatal mistake. It asked...

"ENTER A HUMAN EMOTION <bing>"

Without hesitation (because it was prominent on my mind)—and besides, I didn't want to wait for Rob and Kevin to argue for another half hour—I typed 'LUST'. Truly a turning point in my life. "The Lust of Springtime" a poem by Rob, Jay and Kevin.

The problem was that the MECC computer did not have a very complete background on "lust," so it asked three boys who knew about as much as it did for details.

The results were, shall we say, "less than accurate." Especially since one-third of our group (Kevin) had absolutely no comment, wanted nothing to do with it, wanted new partners. The other two (Rob and myself), knew only what was available by word of mouth in the Tree Fort and from what we could guess based on African issues of National Geographic.

After reading our little masterpiece, Mrs. Nelson was so impressed (or so she said) that she asked—no, I guess you could say demanded—that it be read in front of the class. After carefully removing the divider separating the adjoining classroom (a larger audience to look stupid by), I stumbled to the front of the room and announced in a loud voice "'The Lust of Springtime', a poem by Rob, Jay and Kevin."

Now, mentally picture the scene of poor Kevin smashing his head into his desk and covering his head with his arms groaning "Ohh, noo," followed closely by Rob turning beet red and stifling huge sobs of laughter.

Remember, also, that I am standing one foot on top of the other, white as a sheet (we are talking about a D average in speech), staring into the faces of two whole classrooms who are staring back at me with disbelief. No doubt the thought running through their minds was "Is Mrs. Nelson really going to let him read this!?!?!"

The actual text is lost in the depths of time, but I think this is close:

Springtime is the time for lust.
Fun and Games in Spring. *(a computer translation I'm guessing)*
It's the time, the time for lust.
Do it.
Do it.
Till we turn to dust.

Spectacular, eh? Rob tried so hard to stifle his laughter that he nearly gave himself a seizure. However, it was not a complete failure. Debbie the flag twirler did give me her phone number. Too bad I had no idea what to do with it!

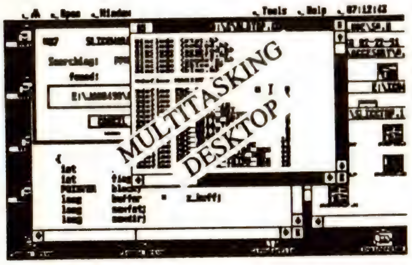
I guess the moral of this story is that computers can help you meet chicks and is a good way to excuse bizarre behavior...a lesson I learned that the other computer "geeks" in school somehow missed. They were far too busy collecting confetti for the yearly locker clean out. Oh well, if I have a talent (and that is doubtful), it might be seeing things in a truly different light than others.

SLICCTOP

The most powerful desktop available!

And still at the unbelievable price of only . . . **$49.95**

(Requires a hard drive and at least 1 meg of memory)



ACCESS FROM GEM PROGRAMS
UNIQUE QUICK ACCESS MENU (Holds up to 144 programs / data files)
CONCURRENT PROCESSING
UNLIMITTED WINDOWS
HOT KEY CAPABILITY
CUSTOMIZED ICONS
ONLINE HELP

Summer Brings New Desktop Applications

By Randy Fester
President of SLICCWARE

SLICCWARE is pleased to announce the introduction of a series of applications written specifically for the SLICCTOP multitasking desktop. The first application, the SLICCTOP text editor will be made available to registered owners the beginning of July, 1991; and will also sell for **$49.95.**

August will bring the release of a powerful word processor, SLICCWORD, which will also be made available only to registered owners. Both the word processor and the text editor will run directly on the desktop and make use of the multitasking, unlimitted windows, and transparent data sharing capabilities found only in SLICCTOP !

Additionally, a terminal emulator and various five'n-dime software modules for interfacing modem hardware and performing file transfers using standard protocols, are planned to be released before summer's end.

Most importantly, SLICCTOP will not increase in price until autumn, when it will undergo a substantial increase in price to reflect its capabilities as an operating system.

Until then, it remains at an unbelievable price of only: **$49.95**

To order directly, send **$49.95** (check or money order payable to **SLICCWARE**) to:
SLICCTOP, P.O. Box 2609, Kirkland, WA 98083 Or call: **(206) 867 - 1786.**

BLOW IT OUT TO 4MB!

SIMM UPGRADES

520/1040ST	$290.00
MEGA2ST	$160.00
520/1040 to 2.5M	$165.00

All memory upgrades are hardwired into your ST. SIMMS use far less power than conventional DRAM chips. 90 day warranty on all work performed. Prices include return shipping to you. Call J & M Computer Specialties today. Prices subject to change without notice. APO, FPO, Hawaii and Alaska addresses call for shipping rates.

More Fun and Games!

At the risk of getting a letter bomb, here's another story of my formative years as it relates to the world of electronics and computers.

This story concerns my high school electronics teacher, Wilber Eggman (our nickname, goo goo ga joob). This was a man who had an instant dislike for me. Apparently, when my brother Denny took his 3-year class 11 years earlier, Denny managed to drop a 100 watt soldering iron onto this guy's lap.

You can imagine (or can you) a new level of dislike "vibes" coming out of this guy. I tried. I really tried, because I was interested in the subject...one full year of doing everything I could to make this guy like me. But he was cold. We are talking liquid nitrogen. Wilber, the super conductor of bad news.

We were a typical class. Sure, we had a classroom full of brains, plus a few dummies like me (I was pretty bad). I'm sure none of them had a clue as to why the teacher seemed to have it in for us. After all, he may have hated me personally, but he was democratic and took it out on us all!

Every single day started out about the same. We were told old WWII stories of how Wilber invaded France with his radar set (no doubt winning the war). We were then told that we needed to go back to the "basics." That meant we would do the most boring and mundane garbage possible.

Then, he would tell us (I'm not kidding) that we were the worst class since he started teaching (Pre-Cambrian period?) and that he hoped enough of us would drop out or fail so he could spend more time stroking his "dream class." This usually took half of the hour.

This guy was a breakthrough in the definition of the word jerk. He did things that blow my mind to this day. He would tell us that he didn't "trust" us with his beloved solid state components. He figured we were so dumb we would blow them all up. So, he gave us the course he wrote up in the 40's and 50's for vacuum tubes. Ask me about 6V6Gts some day. No, on second thought, don't!

Since he had to drag out a tube tester and some *really* old parts, we got a glimpse of his "Goodie Room." Here I was to discover one thing that would really change my life—the relics of the old Richfield HAM Radio station. I thought this was the neatest thing since sliced bread. With this thing (or something similar) you could talk to people all over the earth... and, nowadays, even people in space! Wilber's comment that HAM radio was silly and a waste of valuable time was only more incentive for me to take and pass my HAM test. [If you are a HAM and ever hear me or my wife give us a call! Our radio call signs are WB0VNE and N0KJH (which I contend stands for K.eep J.ay H.appy).]

Anyhow, since Wilber would not let us turn on the set *or* play with his beloved solid state junk (transistors), we waited until the end of one class and took all of his tubes and plugged them into his tube tester...all at the same time.

You can't imagine what happens when you do this. We are talking about a 2000 watt psychedelic light show. This went over real well with him. We got a full year's worth of lectures in the danger of fire and, to top it off, we all got *The Killer Question!*

Now, this was a looooong time ago, so I don't actually remember what the question was, but it was tough! *It Was Impossible!?* It was so hard that he gave us all 24 hours to figure out the answer any way we could. He told us that it was going to count for some incredibly large percentage of our grade. If we failed to answer it correctly, we would fail the course. Wilber figured that this would get rid of enough of us that there wouldn't need to be a class next year. Or so he said.

Enter Dave Senum, always good for a yuck and besides, he had a real CB radio, which was pretty cool in those days. I had some rough idea that this was almost as fun as a HAM radio and was forever asking him questions about it. (Note: CB radio doesn't even come close.) Back to the story...

Dave wasn't going to miss out on his third-year Electronics course and end up taking Woodshop. Besides, Wilber was a vegged out old fart/complete jerk

Toadfile 44 Magnum

Toad Computers, the folks who brought you the original 44MB Removable Cartridge Hard Drive, have another great deal! The Toadfile 44 Magnum. It's our famous Toadfile 44, with three removable cartridges - one filled with PD software, too! Order yours **TOADAY** and enjoy unlimited storage, high speed (25ms), and absolutely legendary support! (Choice of vegetable or garden salad.)

→ *COOL PRICE, ONLY $849!*
Standard Toadfile 44, $699!

New Atari 1040STEal!

Toad Computers has a **major** edge over most places selling the STE Computers. We're an **AUTHORIZED ATARI SERVICE CENTER!** That means that if there's ever a problem, **WE** can fix it. We're not some cro-magnon reseller that's going to tell you to "throw it away" if it's broken, expecting another major cash outlay. We'll even extend your warranty to **ONE FULL YEAR** for $49.95! Now that's a deal!

and didn't change his cloths very often. Yes fans, this called for drastic action!

We went to the nearest pay phone during lunch, where Dave directed me to call the local library (I had the dime or was it a nickel?). Dave instructed me to inform whomever answered that I was calling for "Professor Senum" and needed to reserve a room for that night. His plan was that few (or none) of us would solve the problem alone, so we'd have solve it together. If even a few of us answered incorrectly, the class would be gone. We needed a place to study that had lots of reference material.

OK, I admit I was really scared. I was sure the library police were going to arrest me. After all, didn't I have overdue book fines that were higher than the national debt?

I dialed (scared out of my mind). The nice lady at the library said in a sweet voice "I'm very sorry, sir, but this is very short notice."

Well, that was OK with me. I just wanted to get away without getting caught. I mumbled "Oh, short notice...ahh...OK."

Dave, no doubt sensing that I was about to wimp out, ripped the phone out of my hand. Holding it in both hands as if he was going to head butt it, he screamed "This is *Professor* Senum! Listen Goddamit, I haven't been teaching for as long as I have (yeah, right) to listen to a bimbo like *you* tell me I can't have a room for my class when I need it!...Don't tell me *your* problems just do it!!! I'm going to be there at 6 PM. Have it ready."

He slammed down the phone, sat on the floor and turned white. I said "I can't believe you just said that." He said "I can't believe I just said that."

We did get the room. "Professor" Senum was afraid to show up early lest the library lady meet him and realize he was a tad young for his title. When I got there, the old bat insisted that a person at least 18 years old sign for the room.

Lucky thing we had Tom Hoyne! He had just turned 18, and we dragged him to the desk and got him to scribble his name. His ability to be talked into foolish and dangerous situations created a lifelong bond. Besides, you wouldn't believe how funny he looks when you talk him into stuff like that.

We had the entire class together and took parts of the problem apart. Somehow, we got the correct answer. We also drew some crude pictures for the librarian on her overhead. The next day, Wilber was totally stumped as to how all of the class got the correct answer, and we continued on for the full three years.

I learned some valuable things. First, that the rule makers *can* be stopped from making your life suck (sometimes), if you are clever, sneaky and willing to bend a rule or two. Second, that working together can (sometimes) be better than hoofing it alone. And last, when you need someone to do something foolish or dangerous, Tom Hoyne is your man!

Looking back though, I have to wonder how things would have been if we had all just taken wood shop.

Later, Jay builds an Orgasmatron?!?!

The classic Atari 8-bit computer is the most versatile of the machines which used the 6502 Central Processing Unit (CPU). With the additional chips ANTIC, PIA, POKEY and CTIA (GTIA on later machines)—the latter of which provided Player Missile (Sprite) Graphics—the Atari 8-bit was the most powerful of the 6502 class computers. This was clearly demonstrated by the Atari "Star Raiders" game which led the field in 1979.

Other features, which we now take for granted but which appeared early in the development of the Atari, were colors, full screen editing, upper and lower case letters and overall the best ever graphics in an 8-bit computer. In this article we have attempted to provide an introduction to PM (player missile) Graphics, together with memory locations you will need in order to explore this powerful tool of the Atari 8-bit computer.

How It Started

Our initial interest was to use this computer to develop a visual two-dimensional display to show the mechanism of complement activation in the human body, how it occurs and what the consequences are when this system is activated inappropriately.

Under such circumstances there is a danger of "friendly fire" and bystander lysis if the defense mechanisms are turned against the cells of the host, rather than against the invading microorganism.

Just as the computer provided an excellent forum for Star Raiders, so, too, did it lend itself to a dynamic presentation of the "Battle Within."

To illustrate this reaction, we first had made molecular models, but these did not move. The computer provided the dynamic interaction to show the ongoing process. In 1982, it was not possible to make these models on the mainframe computers available to us at that time.

In June, 1982, we purchased an Atari 800 Computer with 48K memory, an 810 disk drive, an 850 serial/parallel interface and a Hayes 300 baud modem at a cost of about $2600. All are still operational today. Our guide was "Your Atari Computer" by Lon Poole, et al. We also found several excellent articles in Compute! magazine.

It took us less than three months working parttime to finish a program which later won two awards. We used a programming technique known as "Substitution." We reviewed existing graphics programs and modified the shape tables and the colors and paths of the players. Any changes were checked instantly, as they were part of a running program.

We were creative as we were learning from the masters.

What are Player Missile Graphics?

Player Missile Graphics are special graphics characters which can be placed over (visible) or under (invisible) the screen and are independent of the screen background. They are zero to eight pixels wide, and up to 256 pixels high. In quadruple width, each player can be up to 32 pixels wide.

If all four Missiles are programmed side by side, they can be used as a fifth player. In quadruple wide mode, the five players can cover the entire screen. They are so independent that they do not appear if you perform a screen dump with player-missiles on the screen.

Priorities can be established between the players and the screen so that the players can move in front of or behind images on the screen. Thus, you may have a plane fly behind a church steeple in your picture, but remain in full view in front of the sky and the hills in the background.

Players may be positioned anywhere on screen or just off screen waiting to appear, like actors waiting in the wings of the theater, ready to walk onto the stage.

In normal mode, each programmable pixel in the player missiles is identical with a pixel of Graphics mode 7. When you use half height players, you match Graphics 7.5. Remember that Graphics 7.5 is available from Basic XL and XE (OSS). But, if your favorite screens are in one of the more exotic GTIA modes, there is no reason that you cannot use these modes to showcase your masterpiece in Player Missiles.

But long, tall columns prancing across the screen would be very boring, especially if you wanted to show Great Balls of Fire exploding at random. This is where your creativity comes in. When you create your animated masterwork, you must design your players, just as the animators at Walt Disney Studios create their characters.

What we are doing is storing in memory small sequences of code which tell the computer which pixels in the display to illuminate. The data for each player is stored in a special, programmer-defined memory location. The players allow you to create animation by "player flipping" between different bit maps stored in memory.

Each row of the player is defined in memory by a single byte. If your player is 24 pixels high, that shape is defined by 24 bytes. If you create a table of different shapes in memory, you can animate at machine language speed simply by pointing to another memory location in memory. This is accomplished with a routine written by Sak & Meier which is neatly stored on Page Six of memory.

You may flip between the images stored safely above MEMTOP, (the top of memory available to Basic). The engineers who conceived the Atari gave us a hardware register for the X-coordinate for each of the players but they did not provide a simple means of changing the Y-coordinate. Moving the row of the player in Basic is slow and cumbersome.

Sak & Meier have made this a painless process in their vertical blank interrupt routine. This simple machine language subroutine is less than 250 bytes long, and fits comfortably on Page Six of the computer's memory. The writers of the Atari operating system gave us Page Six of memory ($0600-$06FF, 1536-1791) to insert a machine language subroutine which allows you to change the position of the X,Y coordinates of each of the players as often as fifty times per second. That is fast enough for movie quality animation.

The television screen is scanned with an electron beam from the top left-hand corner, across the screen to the right when it shuts off and moves back to the left of the screen to repeat the process.

The interval when the beam is turned off is very short and is known as the horizontal blank interrupt.

When the electron beam reaches the bottom right corner of the screen, it shuts off, and returns to the top left corner. This interval is known as the vertical blank interrupt. Sak & Meier use this interval to have the computer look at the next position for the players. In the case of Player Zero, The X coordinate will be stored in memory location 53248 (HPOSP0) and the Y coordinate will be stored in 1780 (VPOSP0).

Now, you won't find VPOSP0 mentioned in the books. It was created by Sak & Meier for these very fine programs. In the time it takes for the electron beam to move from the lower right corner to the top left corner, the Atari is capable of performing approximately 7980 machine cycles. Moving the images of the players for us is just one of the tasks the computer accomplishes during this vertical blank interupt. Don't underestimate the power of these short routines. They can unlock the flexibility of Player Missiles for you, as they did for us. Please review the description of these routines. The papers of Sak & Meier are a goldmine of information for those who wish to program in Basic. Their papers review many aspects of 8-bit Atari programming. Their programs include:

A machine language subroutine for Page Six ($600 to $6FF)
Vertical Blank Interrupts
Antic direct memory access (DMA)
Definition of the top of Memory (MemTop)
How to select colors for the players
How to set the players' X and Y positions
How to change the pixel resolution of your players
How to set screen priorities for players
How to tell Antic of Vblank PM and the address of the first page of data shape tables

To demonstrate how powerful these programs are, the code to actually move the players around the screen is only a couple of lines long. These are lines 170 and 180 in the February '82 paper. Changing just these two lines will alter the pathway that the players follow. In the August '82 paper, movement is defined in lines 125, 135, 145, 165, 185, 195 and 205. Note that line 205 slows the action down, so the cowboys walk with a saunter.

Memory Locations

When you program the Atari computer, the computer language uses verbs in the form of special memory locations which, when conjugated with the appropriate numbers, execute the programs of the operating system.

There are some essential memory locations for implementation of Player Missile Graphics. You may check what number is set at a given memory location by PEEKing. You may change the number with the Basic POKE command.

Once you have decided how you wish your players to appear, you may POKE all of these values into the appropriate memory locations with a single line of Basic code. Some you may want to change during your program. Just as one actor may play more than one part, your players may represent more than one object. Just POKE in the new code from the selection below.

559 DMA control register (SDMCTL)
See full explanation in CHADWICK.
34=Default value, ANTIC active, screen on
0=Shuts down Antic. Processing time increased 30%
46-produces double line resolution, same size pixel as Graphics 7
62-produces single line resolution, same size pixel as Graphics 7.5 (ANTIC Mode E)

Summary of 559 bit codes.

Option	Dec	Bit
No Playfield	0	0
Narrow Playfield	1	0
Standard Playfield	2	0,1
Wide Playfield	3	0,1
Enable Missile DMA	4	2
Enable Player DMA	8	3
Enable Player and Missile DMA	12	2,3
One line player resolution	16	4
Enable instruction for DMA	32	5

623 Player/Playfield Priorities (only 1 pixel on)
1=All players have priority over playfield
2=Player 0 & 1 have priority over playfield and players 2 & 3
4=Playfield priority over players
8=Playfield priority for registers 0 & 1 over all players and priority over playfield registers 2 & 3

704-707 PM Color registers (COLPM0-COLPM3)
Stored value determines the color of the player and its missile.

1771 Player Missile address (Special PMvblank code, accessible with Sak & Meier program only)

1772 Player Drawing (Special PMvblank code)

1780-1783 VPOSP0-VPOSP3 (Only for Sak-Meier Programs)

1788 Player Missile Address + 4

53248-53251 Player horizontal Position Registers (HPOSP0-HPOSP3)
Stored number gives horizontal position.
0=Off screen left
255=Off screen right
Note: Pos 49 - 207 appear on the TV screen

53252-53255 Missile Horizontal Position (HPOSM0-HPOSM3)
Stored number gives horizontal position.
0=Off screen left
255=Off screen right
Note: Pos 49 - 207 appear on the TV screen

53256-53259 Player width registers (SIZEP0-SIZEP3)
0 or 2=normal width
1=twice normal width
3=quadruple normal width

53260 Missile Width register (SIZEM)
same code as for Players

53277 Graphics Control Register (GRACTL)
Controls Player Missiles with 559 (DMACTL)
2=Player DMA only
1=Missile DMA only
3=Players and missiles activated
Note: Poke with 0 (zero) to turn off P/M

54279-54280 Player missile base register (PMBASE)
Contains the starting address of the player missile shape tables

Images on the television screen are created from the top down, where 0,0 is in the top left-hand corner. This is also true for the players, and the index point for the players is in the top left-hand corner.

Binary notation is used to identify which pixels are illuminated and which are not. It is a little confusing that binary code reads from the right, which will be eight columns to the right of the index point for the player. A blank line would be represented by zero. All pixels illuminated in one row would require 255 to be entered. To illuminate only the leftmost pixel on a single line of the player, you insert the code 128.

To define any combination of illumination and blanks, you must insert the number between zero and 255 which matches the pattern you desire to illuminate on the screen for that row of the player.

Very few of us are so facile with binary code that the appropriate number flashes to mind immediately. The lesser mortals among us have two solutions to this problem of identifying the digital code for each line of the player. One is to draw our designs on graph paper, and then calculate by hand the binary code sequence for each row of the player.

For those who seek a computer solution to this problem, there are player missile generators which can be used to create your masterpiece and automatically translate your graphic image to the necessary digital code for insertion into the program.

One such program is PM Design Aid by Tom Gurak. It is in our AAAUA library. If memory serves me, the program appeared in Creative Computing in 1981 or 82, and was reprinted in Creative Atari, edited by David and Sandy Small and George Blank. It will allow you to design your drawings and digitize them for insertion in your Basic program.

If you are learning to program in Basic, the structure of the players and the concepts you need to program them will reward you as you expand into other areas of programming.

About the Authors

Dr. Orr received his MD degree at the University of Queensland, Australia and his PhD at the Australian National University at Canberra. He is currently a Professor of Anesthesiology at the Medical Center Hospital in San Antonio, Texas. He began computing with an Atari 800 in 1982. His medical programs won several scientific awards later that year. Although Dr. Orr has since acquired an Atari ST and a Macintosh, he still uses his now several 8-bit Ataris for record keeping, to produce a widely distributed newsletter, and for just plain fun. Dr. Orr has been a member of AAAUA for over eight years.

Mitchell Orr, Dr. Orr's son, has lived in the United States for the past twenty-two years and assisted greatly in the development and debugging of the award winning programs. At that time he was a high school student. He now is a graduate of Our Lady of the Lake College in San Antonio with a BA in Political Science and will soon be continuing his studies towards a Masters in Information Science at North Texas University at Denton, Texas.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SI

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by:

$29.95

NEW! Quick ST 3

Software Screen Accelerator and Desktop Customizer

MAXIMUM SPEED FOR YOUR ST OR TT!

- *Speeds up most ST software by speeding up screen graphics*
- *Text, GEM graphics, and GDOS fonts all redraw significantly faster*
- *Compatible with all ST, STE, and TT computers*
- *Supports all screen resolutions, including Moniterm and ISAC*
- *Fastest version ever! Even the "fast" TT speeds up considerably*

- *Easy to use! Install it in the AUTO folder or run it from the desktop*
- *Requires 20K to 40K of RAM (depends on the configuration)*
- *Includes the Quick Index 3 benchmarking utility*
- *Include the MonSTer high resolution screen emulator*

- *Install any DEGAS Neochrome or Prism Paint picture on the desktop*
- *Change the desktop font and icons with our font and icon editor*
- *Install a different font and picture for every program!*

Accelerate...
Benchmark...
Customize...
...any ST or TT
for only $29.95.
(Before June 31 1991)

Upgrade from:
Quick ST II $15
or Turbo ST $20
(with proof of purchase)

Don't settle for imitations. Only Quick ST 3 speeds up all screen resolutions on all monitors.

Branch Always Software
14150 N.E. 20th. St. #302
Bellevue, WA 98007
Phone: (206)-885-5893

Quick ST 3 will be available at Atari ST dealers across the U.S. and Canada in July 1991 at a price of $34.95 U.S.
Write for our free newsletter!
Order Quick ST 3 before June 31 at an introductory price of only $29.95 U.S. Product shipment starts June 17, 1991.

BRAND NEW ITEMS

$\$169^{95}$/ $\$199^{95}$ THE “SUPER E-BURNER!” $\$169^{95}$/ $\$199^{95}$

The Super E-Burner is a **PROM/EPROM** copying/programing device that plugs into your Atari's cartridge port. It is the **FASTEST**, most versatile Eprom programmer ever devised for Atari. It will program all Eprom sizes from 2732's through 1 Meg! Its speed is incredible. It can program a 27128 and double verify its contents in 15 seconds! It is a software driven device which allows the user to **READ** and/or **PROGRAM** proms/eproms and save their contents to disk or hard drive. Only $169.95 plus $8 S/H/I. Mini **GANG BURNER** which is the same as above but will burn two eproms at a time is only $199.95 plus $8 S/H/I.

$\$49^{95}$ “HARD DRIVE PRO BACKUP!” $\$49^{95}$

A truly useful utility for anyone owning a Hard Drive. It is the simplest, fastest, most versatile HD backup program ever offered for Atari 8 bit computers! It will allow you to stream your data to floppys (up to 8 destination drives!), other HD's, and is VCR compatible if and when our VCR backup interface becomes available!

- **SUPER FAST**
- **AUTOMATIC COMPRESSION** to save disk space
- Allows saving to 8 **DESTINATION** drives!
- Allows saving to another HD
- VCR backup compatible
- Restores individual directories
- Works with **MYDOS** or **SPARTA**
- Will save to **80 TRACK** drives
- Backs up by **ARCHIVE**, by **DATE**, or by selected **DIRECTORY/SUBDIRECTORY**
- Supports **ULTRA HIGH SPEED** disk I/O to capable floppy drives
- Allows **PRINTER DUMP** of all pertinent information

Only $49.95 plus $5 S/H/I.

$\$99^{95}$/ $\$139^{95}$ “XF551 3.5" CONVERSION!” $\$99^{95}$/ $\$139^{95}$

The **XF551 3.5" CONVERSION kit** for your XF551 drive will double your storage space (750K per disk!) while allowing you to use the far superior 3.5" disks currently being used by many of the major computer manufacturers. Included with each kit is a high quality **SONY** 3.5" drive, completely mounted in a 5 1/4" faceplate assembly, all cables necessary for a **SOLDERLESS** 2 minute installation, and a completely re-written OS (including some incompatibility problems). This is the best quality conversion of its type! Only $99.95 plus $8 S/H/I. A **DELUXE CONVERSION** which allows the use of the existing 5 1/4" mechanism in your XF551 along with the 3.5" drive is also available. It will allow you to access BOTH mechanisms as two separate drives so copying from 5 1/4" to 3.5" disk or vice-versa is possible even when mixing densities! And its totally **SWITCHLESS!** Just insert your disks and DOS does the rest! Kit contains all features of the standard conversion (above) except that minimal soldering is required. Only $139.95 plus $8 S/H/I.

$\$49^{95}$ “BLACK BOX ENHANCER”!© $\$49^{95}$

A must for all serious **BLACK BOX** owners! This device simply plugs into your **BLACK BOX** and delivers the following features:

- High resolution screen dumping in 16 shades of **GREY!**
- Dramatically improves print quality of **TEXT** or **GRAPHICS!**
- Built in handler will print **CONTROL** and **INVERSE** characters.
- Has built in Hard Drive **TASK MASTER** utility
- Supports **MYDOS** and **SPARTA**
- Supports all densities
- Built in **SECTOR EDITOR** supporting partitions up to 16 meg!
- Displays **DIRECTORIES** and **SUBDIRECTORIES**
- Built in **SECTOR COPIER** utilizes all available memory
- Copies selectable sectors
- Allows editing of **ASCII**
- **SEARCH** by string (**ASCII** or **HEX**)
- Automatic **HEX/DEC** toggle
- Built in **DISASSEMBLER**
- **EDIT/SEARCH** by 11 or 16 bit links/**SPARTA** sector map/or entire disk

Ideal for repairing blown directories, making on the spot repairs or

REPAIRS

For 24-48 hour repair service on Atari computers or drives, call our repair department at (716) 586-5545 day or night. All work is guaranteed, NO minimum estimate fees; if you have two or more items for repair and don't want to spend any money .... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE ... we'll keep the other defective item for parts!

BEST SELLERS

$\$69^{95}$ SUPER ARCHIVER $\$69^{95}$

The new **SUPER ARCHIVER**, obsoletes all copying devices currently available for the **ATARI 1050**! It eliminates the need for Patches, **PDB** files, Computer Hardware, etc. Copies are exact duplicates of originals and will run on any drive; without exaggeration, the **SUPER ARCHIVER** is the most powerful **PROGRAMMING/COPYING** device available for the 1050! Installation consists of a plug-in chip and 6 simple solder connections. Software included. Features are:

- **TRUE DOUBLE DENSITY**
- **ULTRA-SPEED** read/write
- **FULLY AUTOMATIC COPYING**
- **SUPPORTS EXTRA MEMORY**
- **SCREEN DUMP** to printer
- **TOGGLE HEX/DEC DISPLAY**
- **SECTOR or TRACK TRACING**
- **AUTOMATIC DIAGNOSTICS**
- **DISPLAYS HIDDEN PROTECTION**
- **ADJUSTABLE/CUSTOM SKEWING**
- **AUTOMATIC SPEED COMPENSATION**
- **AUTOMATIC/ PROGRAMMABLE**
- **PHANTOM SECTOR MAKER**
- **ARCHIVER/HAPPY ARCHIVER**
- **COMPATIBLE**
- **BUILT-IN EDITOR**-reads, writes, displays up to 35 sectors/track short
- **BUILT-IN CUSTOM FORMATTER** up to 40 sectors/track
- **BUILT-IN DISASSEMBLER**
- **BUILT-IN MAPPER**-up to 42 sectors/track
- **DISPLAYS/COPIES** Double Density **HEADERS**
- **AUTOMATIC FORMAT LENGTH CORRECTION**
- **SIMPLE INSTALLATION**

$\$99^{95}$ The "SUPER ARCHIVER II"!© $\$99^{95}$

NOW! COPIES all **ENHANCED DENSITY** programs plus retains all of the features of our World Famous **SUPER ARCHIVER**! (see above). Allows you to **COPY** or **CREATE** single or **ENHANCED** density protection schemes (including **PHANTOM SECTORS**!). Completely automatic; compatible with the **BIT-WRITER I**; the **ULTIMATE BACKUP/PROGRAMMING** device! Only $99.95 plus $4 S/H/I. **NOTICE**! If you already own a **SUPER ARCHIVER**!, you can upgrade to a **SUPER ARCHIVER II** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$\$79^{95}$ BIT-WRITER $\$79^{95}$

The Super Archiver "**BIT-WRITER**"! is capable of duplicating even the "uncopyable" EA and SYN series which employ 34 FULL sectors/track. The "**BIT-WRITER**"! is capable of reproducing these and **FUTURE** protection schemes of non-physically damaged disks. Simple installation... **PLUG-IN** circuit board and 4 simple solder connections. The "**SUPER ARCHIVER**" with the "**BIT-WRITER**"! is the ultimate **PROGRAMMING/COPYING** device for Atari 1050's. **EXACT DUPLICATES** of originals are made! Copies run an **ANY** drive. Must be used with Super Archiver. Only $79.95 plus $5 S/H/I.

$\$69^{95}$ ULTRA SPEED PLUS $\$69^{95}$

Imagine a universal XL/XE Operating System so easy to use that anyone can operate it instantly, yet so versatile and powerful that every Hacker, Programmer and Ramdisk owner will wonder how they ever got along without it! Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. Use **ANY DOS** to place an **ULTRA SPEED** format on your disks, boot any drive (1-9) upon power-up, format your **RAMDISK** in Double Density, activate a built-in **400/800 OS** for software compatibility, plus dozens of other features too numerous to mention! Below are just a **FEW** features you'll find in the amazing OS:

- **ULTRA SPEED** SI0 for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from **RAMDISK**
- Special timer circuits not required for 1 or 2 Meg upgrades
- Background colors adjustable
- Reverse use of **OPTION** key
- Cold-start without memory loss
- Built-in floppy/disk configuration editor (1-9)
- Built in **RAMDISK** configuration editor(1-9)
- **RAMDISK** exactly duplicates floppy drive so sector copying and sector editing are now possible
- Built-in MINI Sector Copier
- Toggle **SCREEN OFF** for up to 40% increase of processing speed
- Toggle internal **BASIC**
- Ram resident disk loader program (**MACH10** menu)
- **DOUBLE DENSITY RAMDISK** capable
- Entire **MEMORY** test that pinpoints defective **RAM** chip
- Boot any drive (1-9) upon power-up or cold-start
- Supports memory upgrades up to **TWO MEGABYTES**
- **THREE** Operating Systems in one (**XL/XE, 400/800, ULTRA SPEED PLUS**)

$\$39^{95}$ THE “RICHMANS” $\$39^{95}$

80 Column Word Processor

Easy to use, very **powerful**, and **NO ADDITIONAL HARDWARE** required! Works with TV or Monitor! This "**DISK ONLY**" 80 Column Word-Processor is simple to use while offering numerous features such as:

- Completely Menu driven
- Self contained DOS
- Complete Text formatting
- Built-in Printer Drivers
- Page numbering
- Justify and Endfill
- High speed Cursor
- Spell Checker
- 80 COLUMNS ON THE SCREEN!
- Insert and Delete
- Search Mode
- View only mode
- Memory Statistics
- Alternate Output
- Change screen Colors, borders, luminesce
- Mouse compatible
- XEP-80 Compatible

One expert has compared **40 domestic** and **foreign word-processors and concluded that the RICHMANS 80 Column Word-Processor is the best**! Only $39.95 plus $5 S/H/I. (64K required).

$\$199^{95}$ The “BLACK BOX”!© $\$199^{95}$

The **Black Box** is a device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It has two buttons, two switches, and a set of dip switches visible from the outside. It plugs directly into the back of the 600XL, 800XL, and 130XE computers. Custom cases may be an optional expense. The **Black Box** performs three main tasks: interface to a SASI/SCSI bus device (hard disks), Parallel printer port, and a RS232 port. A fourth option, available soon, will be a floppy disk port, especially useful to XF-551 owners. The SASI/SCSI port provides the necessary signals for hooking up most common hard disks. You may partition your hard disk into as many drives as you wish; up to 9 can be accessed at at time. By pressing one of the buttons on the **Black Box**, you will enter the configuration menu, where you can re-assign drive numbers, etc. When you exit, you will be right back in the program you were running when the switch was pressed. Each hard disk can be write-protected. The Parallel Printer port will allow you to hook up any printer that uses the standard Centronics interface. As an option, you can use the computer's extra memory as a printer buffer, or order the **Black Box** with 64K of on-board RAM. You may assign printer number and line-feed options within the menu (for use with multiple printers). Another amazing feature of the **Black Box** is the built-in screen dump. By pressing a button (on the box), the contents of your screen will be dumped to your printer (you can define text or graphics modes with a switch)! The RS232 port supplies the full RS232 spec signals for connection to a modem, or another machine (for null-modeming). The handler for the **Black Box**' s modem port is built in and takes up NO memory! The port handles rates up to TRUE 19.2K BAUD! A future upgrade for the **Black Box** is a floppy disk interface board. This will allow the addition of up to four 5.25" or 3.5" mixtures of floppy drives to be used with the system. The drives will act like standard single/enhanced/double density disk drives, but MUCH faster! All drives will be Super Archiver compatible, and support up to 2 sides of 80 tracks. Along with this hardware upgrade will come software capable of reading, writing, and formatting disks in IBM's MS-DOS format and the Atari ST format, and allow you to transfer files between those disk formats and the Atari's format. In addition , a machine language monitor has been added to allow memory disassembly, memory/register changes, and more. The Price of the **Black Box** is $199.95 for the basic unit and $249.95 with 64K of RAM (for printer spooler) plus $8 for S/H/I. An optional custom **BLACK BOX** case is available for $39.95 extra. The Black Box is a product of Computer Software Services...Not the Black Box Corporation!

$\$199^{95}$ The “MULTIPLEXER”!© $\$199^{95}$

This device brings the power and flexibility of larger systems to your 8-bit. The **Multiplexer** is a device (actually a collection of modules) that allow up to 8 Ataris to read and write to the same drive (typically a hard disk), printer, and talk to each other. One "master" computer (any 8-bit) is equipped with the master **Multiplexer** interface. Then up to 8 "slave" computers can hook up to the master, each having their own slave interface. The "common" peripherals (things that are to be shared) are connected to the master computer. On each slave, all disk and printer I/O is routed through the master, so no drives are needed on them. The master computer can be configured in any manner you wish - you can for example have certain peripherals "local" to the slave, or routed to a different number on the master. Under development is a BBS system that will make full use of this device, allow ing up to 8 lines/users to be using the system at the same time! A multiuser chat mode is a feature of this program, however, you do not NEED this program to run a BBS with the **Multiplexer** (but be warned that not all BBS programs will run concurrently). All slaves are independent, and do not need to have the same program running on them. This system is excellent for BBS SysOps, because you can be using your hard disk(s) while still running your BBS uninterrupted! Another example is in a classroom situation, or anywhere a disk needs to be shared by different people. This is an EXCELLENT programming/debugging tool as well! The **Multiplexer** price is $199.95 for a master and two slave units (plus $5 S/H/I). Additional slave units are $99.95 each.

HARD DRIVE & LIMITED SPECIALS

Hard Drive Systems include drive, Black Box, a zero RF power supply, controller, cables DOS and assorted HD software. All systems are wired, preformatted and have sample programs on them. Attach to your computer and BOOT! No hassles! We have systems available from 5 meg to 108 meg. Prices start as low as $399.95!

Limited Specials are on a first come, first served basis. Preowned items are in exceptionally clean condition and are in perfect operating order. All items are warranteed. Sorry...no rainchecks...no Dealer Discounts. S/H/I to be determined according to weight and value of each item purchased.

1. 5 Meg removable or 10 Meg fixed Hard Drive Systems...NEW!	$399.95
2. 20 Meg industrial HD system	$495.00
3. 32 Meg industrial HD system	$595.00
4. 64 Meg industrial HD system	$750.00
5. 108 Meg industrial HD system	$995.00
We have all HD sizes from 3.5" to 8" industrial—any capacity!	
6. Adapter 4000A controller	$89.95
7. Adapter 4070 (RLL) controller	$125.00
8. Western Digital controller	$59.95
9. Xebec 1410 controller	$69.95
10.130XE x/320K Power Plus and Ultra Speed+	$250.00
11.1050 drives with SUPER ARCHIVE II and SILENCER	$250.00
12.Magnavox 80 column GREEN screen monitors w/sound	$59.95
13.DISKCRACKER (newest version)	$19.00
14.SILENCER (for 1050)	$19.00
15.BLACK PATCH master w/DATA DISKS 1+2	$35.00
16.SUPER PILL w/o case	$25.00
17.SIO Amplifier	$39.95
18.QUINTOPUS/QUINTOPUS II (Switchable Ports)	$39.95/$59.95
19.XE551 Enhancer	$29.95
20.Power Plus memory upgrade (256K or 320K)	$99.95
Lots of used equipment...cheap...call!	
VERY LIMITED—Remote IBM type keyboard with interface for Atari 8-bit computers...complete!	$99.95

The zzSoft Assembly Programming Package

The Package Beginners Have Been Waiting For

Robert C. Arp, Jr.

Had circumstances permitted, "Introducing Atari ST Machine Code" with companion disk is the package I would have published two years ago.

Well, my text would have been longer—perhaps wordier—but with more operating system detail; and the examples would have been different; and I would have supported another editor, assembler and debugger.

But the essence of the package from England that I'm to discuss and that which I would have introduced myself are similar enough that I can recommend this package as enthusiastically as I would have recommended my own.

"Introducing ATARI ST Machine Code" was written by Roger Pearson and Sean Hodgson, published by zzSoft, 3 Riverdale House, Mytholm Close, Hebden Bridge, West Yorkshire, England, HX7 6BP, in December, 1990.

If you would like to purchase the book and disk (I paid $24.95), please contact Best Electronics, 2021 The Alameda, Suite 290, San Jose, Ca 95126-1127 (408)243-6950. In fact, were it not for the efforts of Best Electronics, I would not have the materials which permit me to write this article.

A True Beginner's Package

zzSoft has put together a true beginner's assembly language package for the Atari ST. The disk contains an editor, not the best, but definitely not the worst; an assembler, not the best, but certainly not the worst; a symbolic debugger, again, not the best, but definitely not the worst; a resource construction set that is adequate; and many examples and listings.

The 24 chapters cover disk formatting, pull down menu construction, GEM objects, desk accessories, GDOS, blitting, AES, VDI, BIOS calls, XBIOS calls and GEMDOS calls. Chapter 23 discusses the text editor; chapter 24 discusses the assembler and debugger. Interfacing assembly with GFA BASIC is covered in chapter 18. Other specific topics are resource construction, file selectors and bit images.

The book contains a table of contents, an index, a key code appendix, bibliography and glossary. Text files on the disk cover the resource construction set in more detail, explain all 68000 instructions and all operating system calls. Many of the files are arced, but the disk even includes copies of ARCSH191.PRG and ARC.TTP. The only thing missing is a list of debugger commands. Those commands are available via the Help key when working within the debugger, but I'll be giving you a list of the more important ones.

Evaluating the Package

A programming package of such scope would require months of evaluation if I could not find something to ram down its throat rather quickly. My primary objective was to get an immediate response to AIM readers with the confidence to recommend "yeah" or "nay" unabashedly. For my torture test, I chose a program that would send DevPac to the showers immediately.

The program, SECTDUMP.S, reads a designated logical sector of a designated partition, formats the sector data and writes the formatted output to a designated file.

I quickly learned two very important facts about the zzSoft assembler. One, put everything in the root directory, otherwise the assembler will cough up executable files with strange names in strange places. Two, the assembler outputs a couple of meaningless warnings even when assembly and linking have been successful.

That's ok, I can live with that, and so can you. The assembled executable program ran perfectly. The assembler was unreasonably slow, and when errors were actually present, the messages were a bit cryptic. I could decipher their meaning, but you may have a bit more trouble with the error messages.

Not to worry, I can give you a few pointers. Don't use .s on branch instructions and don't use (pc) with labels. Use a RAMdisk because everything is very disk intensive. I did not check out the RAMdisk included on the companion disk because whether it functions correctly or not is irrelevant—there are plenty of other RAMdisks around.

The assembler, debugger and assembled program are accessible from within the editor. The files you need in the root directory of the disk from which you are working are Assemblr.TTP, Editor.PRG, Editor.RSC, Link.TTP, Debug.TTP and the source and/or program with which you are working.

The Debugger

Within the debugger, the prompt is >. Debugger commands are mostly two characters long. If you single step a program within the debugger, you will not see the first instruction line before it is executed. Instead, the first instruction will be implemented, then the second instruction will be shown. Thereafter, as you single step each instruction, the next will be shown.

Here is a list of the more important debugger commands. You can view the rest using the Help key from within the debugger.

$ Commands

```
$c or $C   stack backtrace
$r         show registers
$p         show basepage
$o,$x,$d   set number base
$q         quit returns you to editor
$b         show breakpoints
$s         set symbol offset
$e         show external symbols
```

: Commands

```
:c or :C   execute or continue
:s or :S   single step
:b         set breakpoint
:d         delete breakpoint
```

The Resource Construction Set

I didn't spend much time with this program. Everything seemed to function correctly. I tried to read in a resource file constructed with Atari's developer resource construction set and could not; however, I was able to read in DEGELITE.RSC and observe the menu and dialog boxes. I must leave some of the fun of exploration to you.

Conclusion

The zzSoft assembly package contains enough material to keep one busy for a very long time. For very little expense, the entire assembly language programming environment can be explored. In fact, for the casual programmer, or for one who uses a higher language primarily, this package might be sufficient for all assembly language programming needs.

```
;Program Name: SECTDUMP.S
;Version: 1.001
;Function:
; Reads a designated logical sector of a
; designated partition, formats same and writes
; the formatted output to a designated file.
;    So that this example be as uncluttered as
; possible, the sector to be read, the partition
; from which it is to be read and the output file ;
path are all coded as constants within the
; program.
;    The associated output buffer is also coded as ;
a constant.
;    A version of this program with a user-
; friendly interface would include a GEM window,
; menus and dialog boxes so that all of these
; constants could be chosen.
;    In addition, the file selector would be
; available for the output file path to be chosen.

calculate_program_size:

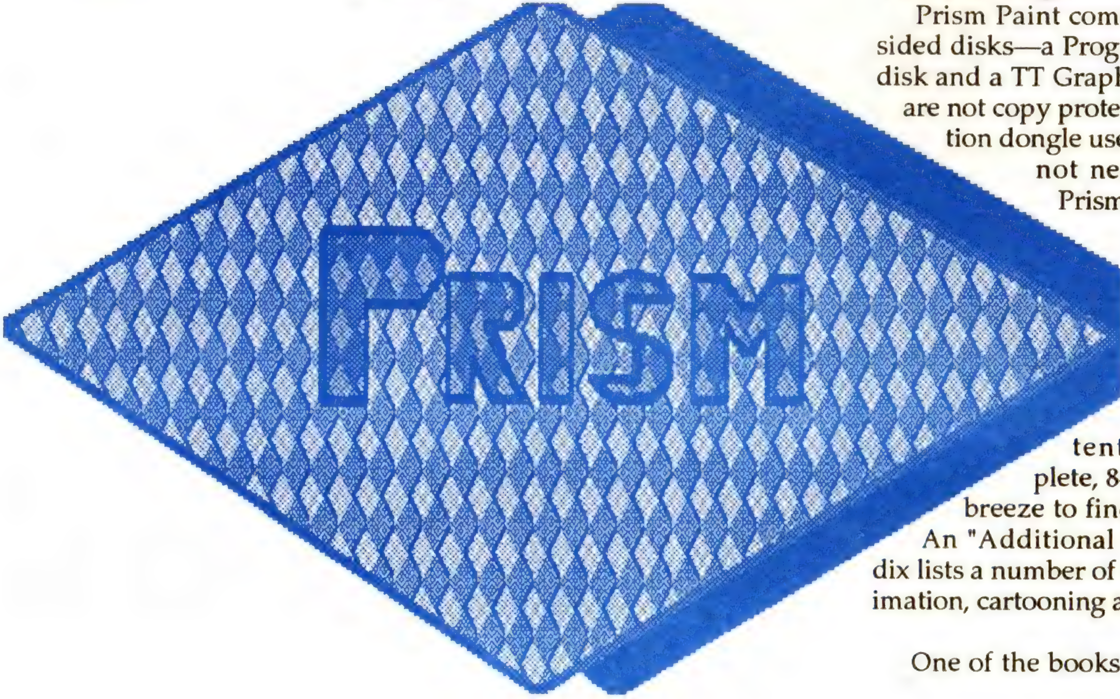
Prism

Bill Rayl

One the brightest new stars in the Atari heavens is Lexicor Software. A lot of people, including myself, have waited for months to get their hands on the packages Lexicor announced back in January of this year.

Well, the packages are shipping, and the wait has definitely been worth it! I have had the pleasure of using both Prism-Paint and Chronos-3D for about a month or so now, and I'm both pleased and impressed. In fact, I was so impressed with the software that I signed up to help Lexicor with their online support on CompuServe.

Although I am now doing support for Lexicor, I am not an employee of Lexicor. I have not been paid by Lexicor or anyone at Lexicor, and I am using my own personal CompuServe account for the online work. I mention my affiliation with Lexicor because it's the honest thing to do. My first resposibility as a reviewer is to give you as honest and thorough a product review as I can, and that is what I intend to do.



Now that the "disclaimer" is out of the way, let's get to the review! We'll look at Chronos-3D next month. This issue, I'm going to focus on Prism Paint.

What is Prism Paint?

Prism Paint is the first truly resolution independent paint programs available on the Atari ST/TT computers. While I've only used Prism Paint in all ST and TT modes, the program is designed to work with all color boards that use a GEM driver. So, if you have an ISAC or ALBERT board from Dover Research or CyberCube's new CyReL SUNRISE board, Prism Paint will take advantage of the new resolutions/colors available.

Complementing its paint program features, Prism Paint can also be used to create or modify FLM animations (created by Prism Paint or Chronos-3D) or DLT animations (created by Antic's Cyber Studio and Cyber Paint).

The Package

Prism Paint comes on three double-sided disks—a Program disk, a Utilities disk and a TT Graphics Disk. The disks are not copy protected and the protection dongle used by Chronos-3D is not necessary for use of Prism Paint.

The manual, which comes in a sturdy 3-ring binder, is well-designed and well-written. A six-page Table of Contents and very complete, 8-page Index make it breeze to find almost any topic. An "Additional Resources" appendix lists a number of useful books on animation, cartooning and drawing.

One of the books on the list—Build-

Paint

ing Beings, Creating Creatures, and Doing Dinosaurs—was written by Lexicor's Lee Seiler.

Topics covered in individual chapters of the manual include Screen Layout, User Interface, Drawing Tools, Color, Fills and Brushes and Animation. A Reference chapter gives short descriptions for all drop down menus, etc.

Throughout the manual, simple step-by-step "tutorials" show you how to use each feature of Prism Paint. Two full-blown tutorials take you through the process of creating a picture and editing an animation.

General Info

The default main menu window displays all the tools avaiable in Prism Paint, as well as the current Brush, Line, Fill and Text settings. Notice that this menu is called a "window." That's exactly what it is...a GEM window. It can be moved around the screen, so you can actually view your picture or frame while the menu is displayed.

By clicking on the "select active window button" at the top right corner of the main menu window, you can switch to only displaying the Drawing Tools, Frame Control (animation) or Color Palette menus.

These menus are actually parts of the large main menu. The Frame Control menu is particularly useful for paging through an animation frame by frame while viewing each frame.

The main menu, itself, can be displayed either full- or half-size. Pressing the right mouse button toggles between the menu windows and the "Work screen," just like in DEGAS and other paint packages.

Tools

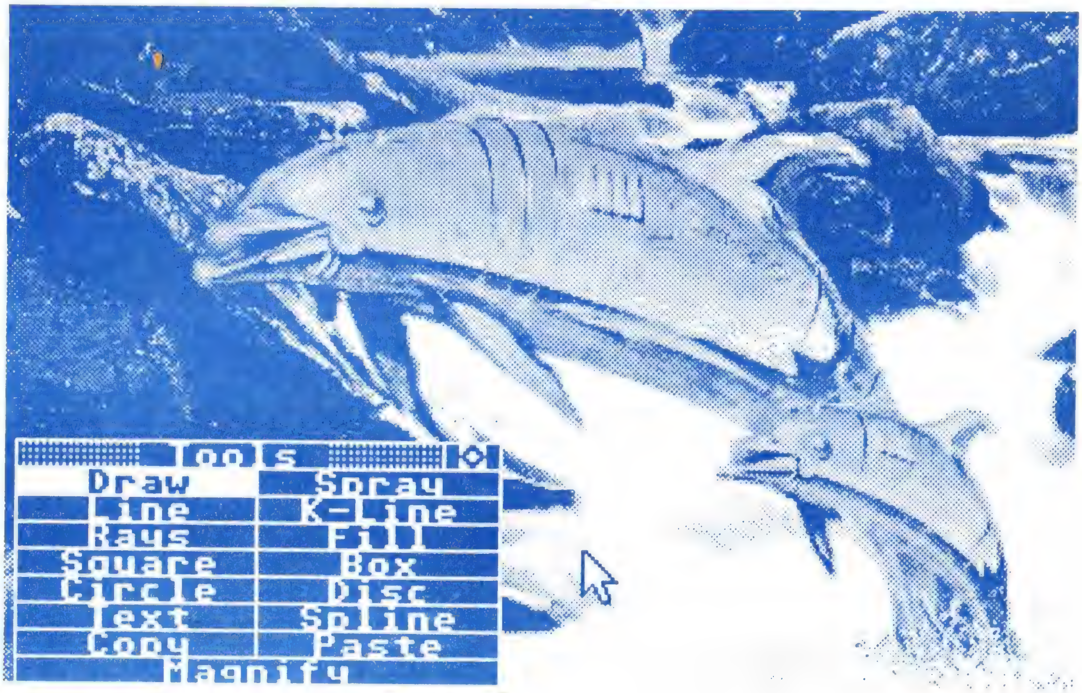
Prism Paint can do all the things you normally expect a paint program to do. You have tools for drawing lines, K-lines, boxes, circles, etc., with or without being filled. Other "standard" drawing tools include Spray, Text and Rays.

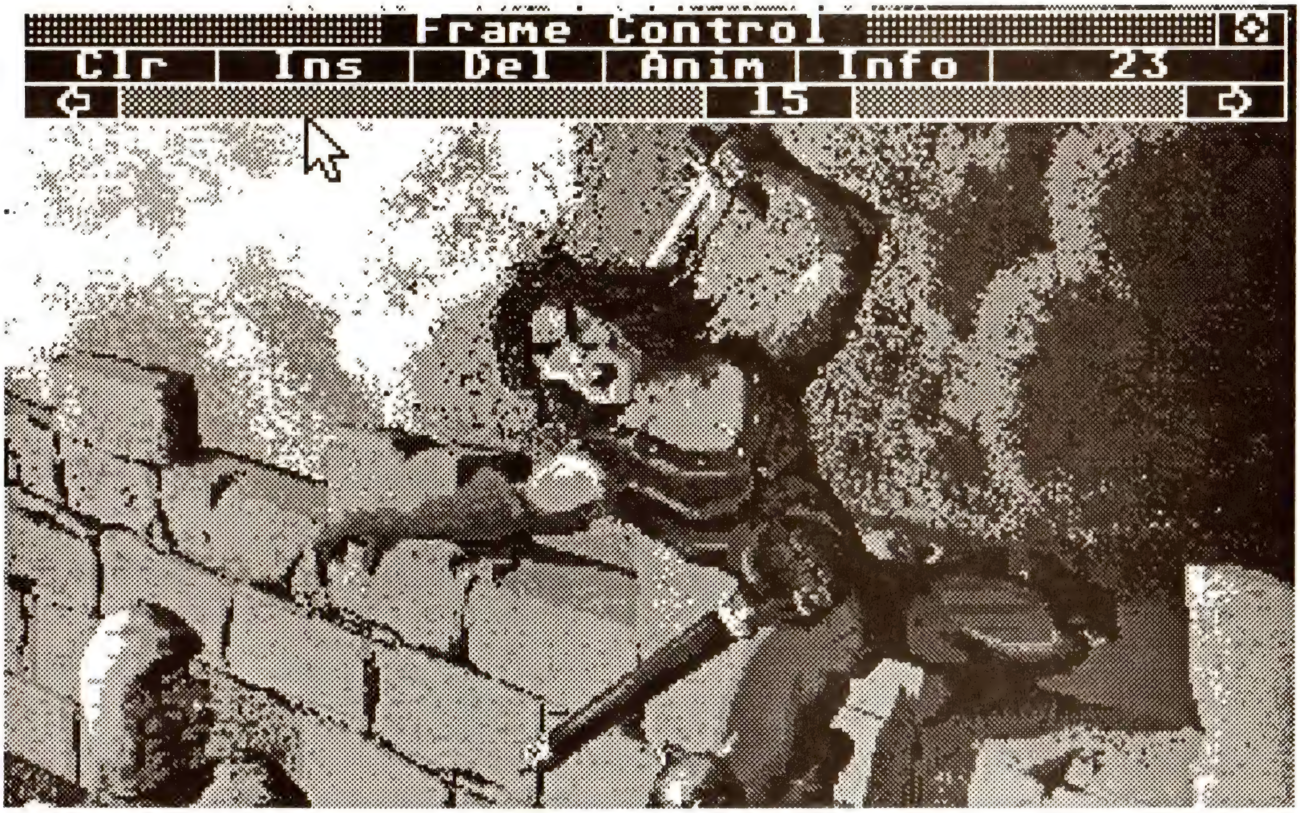
One unusual drawing tool is the Spline tool. With this, you can draw using Linear (Straight), B-Spline (Bezier) or C-Spline (Cardinal) curves. The ability to create Bezier curves is a big plus, allowing you to create very smooth curves and arcs automatically.

Other drawing tools include Copy and Paste, a Magnify mode and dialogs for setting Write Modes (Replace vs. Transparent), Spray Control, Spline Control (for choosing one of the types listed above) and Set Snap Grid.

The Set Snap Grid dialog lets you set a grid size, from two to 16 pixels in in-

> The software performs flawlessly in every resolution on every machine I've tested it on—from a 520ST with TOS 1.0 to a TT with TOS 3.05.





crements of two pixels. Spray Control lets you change the size of the "spray gun" nozzle, as well as the Flow (amount) and Speed of the "paint" being sprayed.

In Magnify mode, you can magnify an area anywhere from four to 23 times. The left-hand side of the Magnification screen gives you access to the color palette, as well as a full-scale view area. Clicking in this view area takes you to another area of the picture. Magnify mode's Color Picker is a handly option that allows you to select an on-screen color quickly.

Color Palette

Prism Paint's color palette is organized into color "pages." Each page can contain up to 32 colors. On a standard ST with no color board, you only get one color page. In TT low resolution, the color palette consist of eight 32-color pages. You can scroll through the color pages by clicking on the arrows contained in the color palette display.

One of the nicest features in 256-color TT mode is the Color Finder. You can use this feature to display all 4,096 colors available on the TT, 256 colors at a time. You can even quickly replace the entire color palette with a 256-color page from the Color Finder.

On all machines, you can Load and Save color palettes and change the RGB values for a given color in the palette.

Fill Patterns

The fill pattern options available in Prism Paint are wonderful. You have the choice between monochrome or color fill patterns. On a color monitor, the monochrome fill patterns can use any one color from the palette. For color fills, you can use all the colors available in your palette.

You can have up to 36 different mono and 36 different color fill patterns available at one time. Prism Paint allows you to save these palettes individually for maximum flexibility.

You can, for example, use Prism Paint's fill pattern capabilities to create "dithered colors," thereby extending the number of "viewable" on-screen colors. Although the dithered colors are not "true" colors, they sure make a difference, especially in ST medium resolution. This dithering of colors is sort of like mixing paint on a "real" palette...equal parts of red and yellow make a very nice orange, for instance.

One of the most impressive features here is the ability to "grab" a fill pattern from a specified area of the Work screen. I recently used this feature on a snapshot of the Hotwire menu. I "grabbed" the little CodeHead icon (the "info" icon) and used it as a fill pattern. Kinda neat.

Brushes

Up to 16 brushes can be available at one time in Prism Paint. As with fill patterns, you can edit/create your own brushes and save them to disk. You can grab an area of the work screen and use it for a brush, just like you can with fill patterns, as well.

Along with editing of the brush itself, you can also edit the brush outline. This allows you to create crosshair outlines, etc.

Animations

A review of Prism Paint wouldn't be complete without a look at this software's animation capabilities. Prism Paint allows you to add background images or color changes, etc. to animations created with Lexicor's Chronos-3D or Antic's Cyber Paint/CAD-3D software.

Or, you can create your own .FLM or .DLT animations from scratch directly from within Prism Paint!

Animation in Prism Paint is handled on a frame-by-frame basis. Options for Clearing, Inserting, Deleting and Animating frames are all contained in the center of the main menu or accessible on the small Frame Control menu.

Whenever you insert a frame, Prism Paint automatically makes a copy of the current frame and inserts it—along with everything in that frame—after the current frame. This makes it very easy to modify the frames to create animations fairly quickly.

To move from frame to frame, you can either click on the scroll arrows at the bottom of the menu or simply use the left or right arrow keys. To actually animate your frames, Prism Paint has a built-in player that allows you to choose the number of frames per second. You can also set Loop or Ping-Pong mode. In Loop mode, all frames are animated and then the player jumps back to the first frame to start the sequence again. In Ping-Pong mode, when the animation gets to the last frame, it then works its way backward frame-by-frame to the first frame and then starts over.

You can even play animations from disk without loading them into Prism Paint, via the Play Animation option in the File drop-down menu.

Miscellaneous Features

Prism Paint can load the following graphic file formats: Prism Paint (PNT), Degas (PI?), Degas Elite (PC?), NeoChrome (NEO), Amiga IFF, CompuServe GIF. Pictures can be load to screen or to the Clipboard. By loading to the Clipboard (the same place images go when you Copy them), you can Paste the graphic into a frame, or even use it as a drawing tool!

In addition to the above mentioned graphic formats, Prism Paint can save images contained in the Clipboard as an IFF .BLK (compatible with Degas) or as C, Assembly or BASIC source code. When saving BASIC source, you have the ability to select the starting line number and increment.

Prism Paint's ability to load GIF pictures makes it a fairly useful picture converter. If the GIF you are loading has the same or less colors in it, then Prism Paint will keep those colors. Otherwise, the picture is converted to gray scale. You also have the option to resize the picture to half or double its size. While not as versatile as some stand-along GIF viewers, Prism Paint is just about the *fastest* GIF loader I've ever seen.

Another welcome touch to Prism Paint is that there are keyboard equivalents for nearly every option. You can hit a single key to select individual drawing tools and for frame manipulation. For instance, pressing Insert inserts a frame in your animation, Clr/Home clears the current frame, etc.

Hitting the Undo key while at the Work screen removes the most recent change you made, restoring your picture.

TT users have the option of loading the program buffers and animation buffers into ST or TT Fast RAM.

So, What's Missing?

While I consider Prism Paint to be the best drawing program I've seen on an Atari ST/TT, there are a few things I'd like to see added.

First, I'd like to be able to manipulate graphics stored in the Clipboard. For instance, I'd like the ability to rotate, shrink and stretch the clipped image. Also, the ability to copy odd-sized objects (lassoing) would be nice.

A feature that allowed for gradation fill patterns would be nice, too—one where you select the beginning and ending color/shade and Prism Paint calculates the inbetween shades and applies them either as horizontal, vertical or radial shading.

While in the Work area, it would be nice if Prism Paint had an option to display the actual coordinates at which your brush was located on the screen. This would be highly useful when working on individual animation frames.

Without the above suggested additions, Prism Paint is still my top pick for drawing programs on the ST/TT. I've run into absolutely no problems/bugs in Prism Paint (and it's version 1.0, even!). Everything works as advertised in the manual. The software performs flawlessly in every resolution on every machine I've tested it on—from a 520ST with TOS 1.0 to a TT with TOS 3.05. With a number of 16.7 million color boards hitting the market at fairly reasonable prices, Prism Paint is the obvious choice for anyone thinking of going the 24-bit color route.

Games

#596 - Quick Draw V1.0 - Pictionary drawing game
ST Reverse V1.0 - Othello type game (Color)
#769 - Super Breakout (Mono Only)
#957 - Mystic Mirror: Adv. Game Similar to Dungeon Master. 2 Players (Color)
#960 - Wheel of Fortune V3.0 (Color)
Stellar Starfighter - Shoot'em Up
#962 - Space War V1.0 - The Classic Space Shoot'em Up for 2 Players (Color Only)
#963 - Go Up V1.0: Lode Runner Clone w/Editor (Mono Only)
#980 - **Tetriside** - Tetris type game for 1 or 2 players (Color)
Valgus Squared - Sequel to a Tetris clone. Now those seven familiar pieces come at you from all four sides of the 27 x 27 area. (Clr)
#993 - *Monochrome Games*
Man Pac - Pac Man Clone
Columns - Tetris Clone
#1040 - **Sorry V1.8** - Just like the board game. For 2-4 players. (Color Only)
Valgus V2.0 - Tetris clone for 1 or 2 players simultaneously. (Color Only)
#1079 - Xenomorph Maps.
#1175 - MidiMaze II (DBL)
#1180 - Hac Man 2 - Professional quality Pac Man Clone. (Color/1 Meg RAM/DBL)
#1202 - Hero *Vapid's Keep* Demo (Color Only)
#1222 - MORIA - Single player dungeon simulation (1 Meg RAM/DBL)

For Dungeon Master

#511 - Maps for Levels 1-7
#512 - Explicit Hints and Character Set on the leve above Chaos with the best equipment selection.
#590 - Game Disk Organizer
Saved game file of characters with a Firestaff weapon.
#720 - Maps for Levels 8-14

For Chaos Strikes Back

#898 - Maps for Levels 1-10
#899 - Walk thru of opening level. Dragon Lair portraits. 5 Fantasy and 3 Sci Fi character portraits. Prison List. Spells and Potions List and more!
#997/998 - Maps for Levels 5 & 3
#1015 - *Cartographer Demo*
Maps out or Edit your Dungeon Master or Chaos Strikes Back Saved Games. Demo fully functional on levels 1 & 2. (1 Meg RAM)

Utilities

#399 - Degas/Degas Elite Printer Drivers
#400/800 - 3 1/2" Disk Labeling Programs
#438 - Vanterm V3.0 - Shareware Terminal
#443 - Intersect RAM Baby, Amortization
#514 - Monochrome Emulator V3.0 - Run Mono programs on Color monitors
#688/866 - H.P. Deskjet/Laserjet Utilities
#768/938/1165 - NeoDesk Icons
#801 - *Label Printing Programs*
Cassette Label Maker, Label and Envelope Printer and more.
#888 - *Atari ST Subjects* (Book) Programs
#938 - NeoDesk Icons, Recoverable Trashcan V1.2
Quick NeoDesk INF Loader, NeoDesk Canvas
#940/941 - **LaserBrain V1.31** - Epson Emulator for Atari SLM804 Laser Printer. (Mono Only/DBL)
Additional Fonts on #1001-1003
#950 - **24 Pin Printer Emulator** - Written for printers without a letter quality mode.
Deskjet Disk Labeling Program
Menu Master - Set up menus to auto load programs on your own disks.
#951 - DC Show It V1.1, Head Start V1.1, Little Green Item Selector V1.6C
#952 - Address Labeler V2.0 - Create, Print and Store address labels
#988 - Fast Copy III, NX-1000 Set Up
H.P. Deskjet Print Utility V1.4
#991 - Label Printing for H.P. Deskjet & Avery 5260 Labels, Desktop Formatter, Disk Sector Edit.
#1008 - **ICONDESK** - Set up different looking icons for different file types. 79 icons & editor included. (Mono required to use editor)
#1009 - Diamond Back II w/Cache Demo
#1038/1039 - DC Desktop Icons
#1041 - ST Data Handler V3.0 - Simple, mouse driven data base program.
Pack V2.0 - Reduces file size of programs while still allowing them to be executable.
#1130 - Double Click Utilities - Disk full of handy utilities from Double Click Utilities.
#1174 - Address/Labeling Programs

Bible on Disk

King James Version
Double Sided Package (8 Disks) $24.95

Desktop Publishing

#500/600 - Publishing Partner Fonts
#599 - *PageStream Fonts*
Binner, Futura Black, Hal, Lubalin, Futura Extra Bold Condensed
#737 - Calamus V1.09 Demo - Fully functional except for Save (Mono/1 Meg RAM/DBL)
#758/759/994 - Calamus Fonts
#870 - ***PageStream Fonts***
Atari, Baby Teeth, Lucida, Old English
#895 - PageStream V1.8 Demo (DBL)
#935 - *Desktop Publishing Utilities*
Convert to .IMG V1.20 - Converts Degas, Neochrome, Spectrum, Art Director, Mac Paint and TNY pics to .IMG format
Demos from Wiz Works
Fontverter Demo - Convert fonts between PageStream and Calamus
PageStream File to 300 DPI .IMG conversion
#1028 - ***PageStream Font Editor V0.8***
Now you can edit and touch up those PageStream Fonts. 20 page manual included on disk. Also included: Improved Postscript Screen Fonts: Book, Chancery, New Century Schoolbook, Palatino, Times
#1044 - ***PageStream Fonts***
Adverse, Barnum, Burlington, Oblique, Caligraphy 2, Celtic, Chancery, Chicago, Dingbat, Flash, Harloe, Olympia, Souvenir Medium, Souvenir Medium Italic
#1094 - ***PageStream Fonts***
Architect, Avant Guard, Bookman, Broadway, Chancery, Dingbat, Kibo, Oakville, Palatino, Western
#1150 - ***Calamus Fonts***
Architect, Broadway Engraved, Counter Point, Fancy Chancery, Swiss Medium, Tiempo, Tiempo Bold, Tiempo Italic, University Roman
#1153 - ***Calamus Fonts***
Lucifer, Bodoni, Bodoni Italic, Drurylane, Drurylane Italic, Hallbats
#1179 - ***Calamus Fonts***
Complete Glib font from FontAbility
#1190 - ***Calamus Fonts***
Micron, Tiempo, Swiss Medium, Leecaps, Medici, Windzor, Zalescap
#1223 - ***Calamus Fonts***
Chicago, Comet, Cursive, Gaudy Cond, Gallia, Gillies, Goudy, Legend, Old English

Applications

#810/811 - SHEET V2.5P - Shareware Spreadsheet.
#965 - Checkbook V1.09, Almanac (Color)
#989 - Paperless Accountant
#999 - **ST Writer V3.8** - Simple easy to use word processor with extensive documentation on disk. H.P. DeskJet Driver included.
Spell V2.8 - Spelling Checker (No words)
#1026 - B/STAT V2.36 - Powerful graphics and statistics program. (DBL)
#1063 - **Address Database V1.45**
A dedicated address book (Color)
#1131 - Deluxe Paint Demo
#1133 - Gramslam Grammer Checker V2.3

Children's Programs

All Children's Programs Require a Color Monitor
#551 - *Kid Shapes*
Graphics design program patterned after a magnetic set. For ages 2-8
#552 - *Kid Shapes Plus*
As above, but for older children. Larger number of choices for more complex pictures. For ages 8 & up.
#667 - *Benjamin's ABC's*
Teaches young children the letters of the alphabet with digitized speech. (DBL)
#699 - *Kid Adder* - Uses pictures to teach addition
Kid Color - Learning game for 3-7 year olds Uses the mouse to point to boxes with a certain color.
Kid Story V1.4 - A silly version of the Little Red Riding Hood. Allows children to create a story.
#920 - Simply Math, Picture Puzzler
#982 - Body Shop: Human Anatomy Tutor

PrintMaster Utilities/Graphics

#393/394/533/773/774 - Additional Graphics for use with PrintMaster Plus (5 Disks in all)
#799 - ***PrintMaster Utilities***
PrintMaster to Degas, View/Transfer graphics, Print graphics on Epson/compat.
#1169 - ***PrintMaster Utilities***
Convert to & from IBM Print Shop/Master

Atari ST Book

of Tips, Instructions, Secrets and Hints for the 520, 1040 and Mega ST begins where the Atari Owner's Manual left off, providing step by step instructions that helps both beginning and experienced users to get the most out of their ST's.

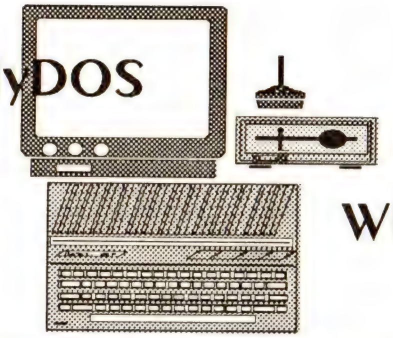
SpartaDOS vs MyDOS



Which One is Better?

John Kasupski (WNYAUG)

In a past issue of Atari Interface Magazine, Tim Feenstra of GRASS made the statement that SpartaDOS is only marginally better than the public-domain disk operating system MyDOS, which costs much less. This article will explore whether or not that statement was entirely accurate.

First of all, however, I should let you know that this article is not entirely objective, because it is being written by an author who is:

- A confirmed SpartaDOS user, and
- Fortunate enough to have a girlfriend who has more sense than to unplug the MIO.

Despite that, I will attempt to make an unbiased comparison between the two disk operating systems, because what is better for one user is not necessarily better for another.

Costs

First of all, MyDOS is indeed in the public domain, which means it costs much less than the commercial SpartaDOS in either disk-based or cartridge-based versions.

MyDOS does support true double density, it supports subdirectories, and it supports large capacity drives. You *can* use it with an MIO, hard drive, DSDD drive such as the Atari XF-551, etc.

The MyDOS menu is very similar to the Atari DOS 2.5 type of menu with which most Atari users are familiar. This means that an Atari DOS user will have less to learn when converting to MyDOS than he or she would have to learn if converting to SpartaDOS.

On the other hand, users familiar with MS-DOS on the IBM will find it easier to adapt to SpartaDOS, because SpartaDOS is a command-driven DOS.

Also, as a menu-driven DOS, MyDOS is still a "small system" type of DOS. If you plan on adding one or more hard drives to your system, or an MIO, or have a memory upgrade and want extended RAMdisk support, you'll be a lot better off with the added speed and flexibility of SpartaDOS.

If you're primarily a game player, you'll find that a lot of game programs won't work with SpartaDOS because of memory conflicts. SpartaDOS loads itself into memory and then moves the MEMLO pointer up to protect itself. If the program obeys the MEMLO pointer, like Atari Corp. says to do in the manual, then the program will work with SpartaDOS as well as it would with DOS 2.5 or MyDOS.

On the other hand, if you're like me and installed a 256K memory upgrade in an Atari 800XL, connected a 256K MIO, and plan on connecting a 20Mb hard drive, you're going to get frustrated with MyDOS rather quickly. The way in which SpartaDOS handles subdirectories is much more convenient.

SpartaDOS also supports batch files, multifile copying, Ultraspeed sector skewing on modified drives, and a variety of densities, all of which are either missing entirely or much less conveniently supported with MyDOS.

This is not to say that MyDOS is entirely useless; to say this would be a disservice to the readers of this article. MyDOS is a low-cost alternative which provides many more desirable features than the original Atari DOS.

But to say that SpartaDOS is only marginally better than MyDOS does not strike me as entirely correct. If you are a menu addict, the SpartaDOS Toolkit provides a DOS 2.5 lookalike menu that lets you enjoy the flexibility and power of SpartaDOS along with the ease of operating from a familiar menu environment. With MyDOS, there is no command processor—you're just stuck with the menu, and MyDOS is missing a lot of the features supported by SpartaDOS.

In the final analysis, it depends on what you're using your Atari for. If the major use of your DOS is to load the latest PD/ShareWare adaptation of Tetris, MyDOS may suit your purposes just fine, and it's definitely an improvement over Atari DOS 2.5.

However, if you're doing word processing or database construction, or if you want to run a BBS using BBS Express Pro! and you have megs of hard drive space, then SpartaDOS is well worth the investment in terms of user convenience alone, even before you consider other features missing from MyDOS.

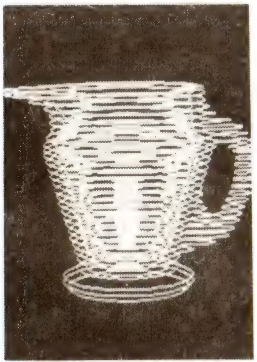
In other words, you choose a DOS the way you choose a word processor, database, or any other application program: you choose a program that best suits your own needs. If MyDOS gives you everything you need in a disk operating system, then more power to you.

As for me, I'll take SpartaDOS anytime over any other DOS I've seen for the Atari 8-bit.

3-D MODELER FOR 8-BIT ATARI!

All of the pictures appearing on this page (except the top right) are unretouched TV-screen photos of 3-D models rendered by a new commercial 3-D shaded-modeler for Atari 8-bit computers.

Two new programs!



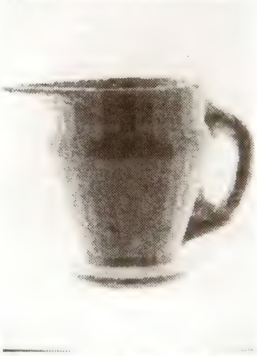
Pitcher, rendered by MODEL BUILDER (TV Screen Photo)

ChromaCAD™ 3-D MODEL BUILDER 91 program

With the ChromaCAD™ MODEL BUILDER program, you can build any 3-D model you can dream of. You merely start at the bottom and draw the contour lines of the model as you work your way up. Add surface colors to the model as you draw the lines. *You* decide how many contour lines to use for each model (up to 158) and *you* decide the elevation of each line. Huge scrolling 32767 x 32767 graph allows you to construct contour lines *as detailed as you want.* Supports computer-assisted drawing of lines, circles, arcs, ellipses. Displays models in contour-line form.

With This program, you will be able to construct unbelievably sophisticated 3-D models. The MODEL BUILDER 91 program reflects a new breed of 3-D modelers -- completely free-form, sculptured-surface -- no "extrude" or "sweep" limitations. You will be able to construct models of human heads so accurately that, when you display them with the ChromaCAD™ SURFACE SHADER XE 91 program (described below), *you will be able to recognize the subject from the model !* (See the photo of an actual bust and the 3-D renderings.)

Photo of actual bust of human head

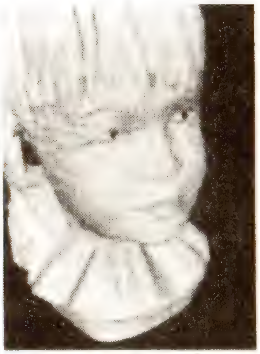


Same Pitcher ,rendered by SURFACE SHADER (TV Screen Photo)

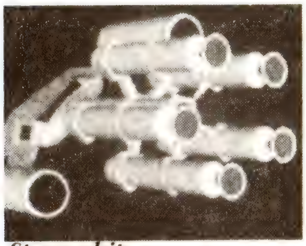
ChromaCAD™ SURFACE SHADER XE 91 program

The ChromaCAD™ SURFACE SHADER XE 91 program can display any model constructed by the MODEL BUILDER program in surface-shaded format from any point of view, using up to three lights. Lights can be individually varied in intensity and individually set to strike the model from any direction. Models can be displayed in a variety of modes, including high resolution, color,and *3-D stereo.* Colors can be reassigned instantly without replotting the model. Up to 61K of computer RAM can be used for image display memory. (The screen photos appearing on this page are of models rendered in high-resolution 61K format.)

Up to ten models can be individually oriented in 3-D space and displayed together to produce one compound multi-model scene. (Terrain model, Airport model, airplanes, cars etc. combined to produce one scene.) The program also supports negative, mirror, and stepped-tone rendering, automatic clipping, highlighting, ambient lighting, and inside viewing of models. We know that all of this is hard to believe so, with purchase of the SURFACE SHADER XE, *we include the bust model (shown to the right) free of charge.* You, yourself, can view the model from any angle, in any mode, using any lighting or rendering option you want.



3-D model rendering (TV Screen Photo)



Space ship, 5 cluster rockets (TV Screen Photo)

3-D Model Rendering (TV Screen Photo)

View any model in 3-D Stereo! (With included 3D stereo glasses.) Watch models virtually jump off the screen.

ChromaCAD™ MODEL BUILDER 91 program with
136 page illustrated, indexed manual
Order # 21 (requires 48K Atari) $29.95

ChromaCAD™ SURFACE SHADER XE 91 program with
69 page manual, 2 pair Stereo 3-D Glasses
and sample MODEL DISK #1 (contains 10 models)
Order # 35 (Requires 130XE) $29.95

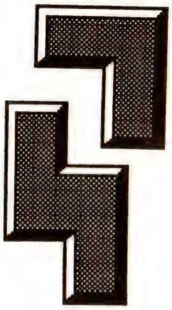
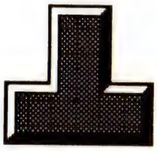
DREDIS

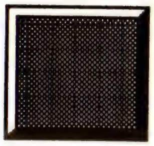




Bill Rayl

The 8-bit marketplace ain't what it used to be, but there are still some very excellent programs being released. One area where the 8-bits have always been superb is graphics, and hence, some of the all-time best games I've ever played were on the 8-bit Atari. KE-Soft from Germany—through their US distributor, Software Infinity—has released a number of games for the 8-bit Atari. One of those games is DREDIS. The game runs on any Atari 8-bit with at least 64K and comes on one SS/SD disk with *no* copy protection, so you can make legitimate backups for your personal use.

The documention is comprised of a simple two-page description printed on the inside of the game package's cover. On these two pages, you're given all the info you need to load and play the game, as well a point value chart for placing tiles, filling lines and completing levels.

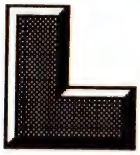


Gameplay

Anyone addicted to Tetris and its variations is guarateed to like DREDIS. In this game, you rotate Tetris-like geometric blocks in an attempt to fit the blocks together, just like Tetris. Unlike Tetris, however, the blocks fall from the top center of the screen and are moved horizontally into one of two side "wells." If you can imagine playing Tetris with the monitor turned sideways, with the ability to move your blocks left or right, you've got a good idea of what's going on in DREDIS.

The basic premise is to align the blocks in such a way to fill vertical columns with the blocks. These filled columns then disappear, making way for more blocks. Once a certain number of columns have been filled in on both sides of the "well," you move on to the next level. The number of columns you need to fill changes with each level—for instance, you fill five columns on Level 1, 10 columns on Level 2, etc.

As if that weren't enough, the higher levels contain barriers that you have to circumnavigate. At these higher levels, the game gets pretty intense. A two-player option allows you to alternate play between yourself and a friend.



Graphics and Sound

The software KE-Soft is putting out contains commercial-quality graphics and sound. DREDIS is no exception. The geometric blocks in DREDIS are almost metallic-looking in quality...they look like little blocks made made of solid steel. The main screens for each level are simple, but clean and colorful—they don't get in the way of the game. The music changes for each level. In some games, the music actually hinders gameplay and you quickly wish you could turn it off. In DREDIS, the music fits into the gameplay quite well...it might even add a bit to the pressure you feel while playing. It sure worked on me.

Conclusions

DREDIS is very (and I mean *very*) addictive, just like its Tetris cousins. The game concept is simple, but the "strategy" element combined with a feeling of ever-building pressure to fit blocks together quickly makes these games arcade-style classics.

DREDIS delivers all that you would expect from a Tetris variation. KE-SOFT and Software Infinity have a real winner in DREDIS. At a cost of only $10.50, this game is a super bargain.

Yes, if you're a Tetris lover, DREDIS is a game for you! And, if you're one of the few gamers on the planet who haven't played Tetris or a variation of Tetris yet, you gotta see what you've been missing!

R-Time 8 Battery Replacement

Rick Reaser (P3ACE)

A couple days ago, I was word processing away and my time/date display line started to go nuts. The day of the week and the year started to toggle erratically. I had gotten my R-Time 8 cartridge a couple of years back and figured the battery was going bad.

After carefully separating the two halves of the cartridge, I measured the voltage across the battery and found it to be only 2.2 volts. I had to keep the two halves of the cartridge fairly parallel when separating them to keep from bending the pins off.

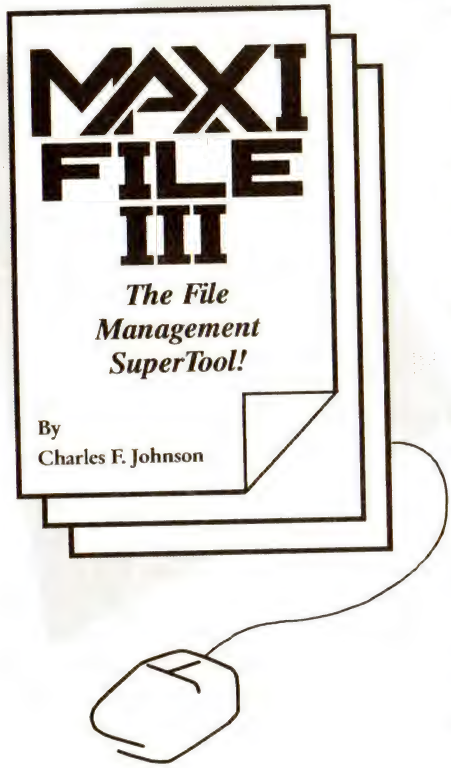
Next, I removed the circuit card from the cartridge half. I unsoldered the battery from the card with a low voltage soldering iron. The battery has leads already fastened to it which I tried to unsolder. My plan was to reuse them on the new battery and solder the assembly back to the card.

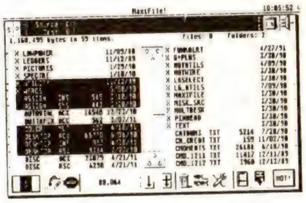
Those leads must have grown onto the battery since they refused to come off, no matter how hot I got them. Fearing that more heat would cause the battery to explode I trundled to my local electronic parts store.

To my surprise, Centennial Electronics, here in Colorado Springs [(719) 633-4666] had a battery holder for the 3V battery and the pins on it lined up with the holes on the circuit card. Amazing!!! The battery holder is made by Keystone and is part number 106. It only cost $1.49.

After sucking the solder out of the two circuit board holes and making sure that the plus lead was going to the plus hole (clearly marked on the circuit card), I soldered the new battery holder in. Next, I slipped in the new battery, making sure I got the polarity right.

I snapped the card into the cartridge case and the cartridge case halves back together and things were good as new. Clearance between the new holder and the case was no problem. Now, the next battery change will be a real snap.





Nothing compares to MaxiFile III!

That's right – there's just no competition! **MaxiFile III** is far and away the most advanced file/disk management utility for the Atari ST and TT; nothing else even comes close!

MaxiFile III runs either as a GEM desk accessory or as a GEM program, so it's always available when you need it. You'll never have to exit a program just to copy, erase, move, or rename files or folders, or to format or duplicate a disk.

Our unique **Graphic Disk Info** display shows you the percentages of used and free space on all your disk drives, both numerically and with a bar chart.

Special **batch operations** let you rename groups of files, change date stamps, change file attributes, "fastload bits" and TT RAM flags, and even queue up a list of files to print – with just a few mouse clicks or keypresses!

If you've ever misplaced a file, you'll appreciate MaxiFile's powerful **search** function, which lets you search for multiple types of files by time/date, attributes, and more!

And if you've ever erased the wrong file by mistake, you'll *really* like our fast, safe **recoverable delete** function.

Perhaps best of all, MaxiFile III has special links with the other stellar programs in the CodeHead catalog, to increase its power by leaps and bounds.

See your favorite software dealer for a demonstration of MaxiFile III today. If you don't have a favorite software dealer, call us right away for more information.

WHY NOT A GENERIC SOFTWARE ENGINEER'S FORUM?

DAVID J. STUART

Sitting here in my classic padded office chair and reflecting upon the extent of my success over the past dozen years... deriving a good deal of contentment from the manifold projects completed...saddened by the nearly complete lack of acceptance accorded my work...frustrated by the token pittance received from my whimsical marketing attempts...it dawned on me with the clarity of a high desert sunrise that it was not my expertise that was at fault, but rather my complete lack of social functionality! It also occurred to me that I was probably not alone in this respect.

There are, undoubtedly, a large number of people in the same predicament, and the numbers unquestionably swell with each passing day. It would be interesting to discover just how many folks there are out there who qualify as 'non-social programmers'.

Non-Social Programmers

By definition, this would be any person who possesses at least a professional ability as a programmer/developer—the home software engineer—while also having a social life that is practically non-existant. These people, like myself, spend endless hours sequestered in their own private world of the monitor and keyboard contemplating the mathematical correlation between two functions to the exclusion of all else.

I do occasionally interact with my family. I fix dinner and clean house as time permits, while my spouse earns the bulk of our income (barely enough to survive!) and the kids pester me for some "quality time."

If the people in question happen to be unencumbered by the responsibilities of family life, they would probably live in a world of dust and spiders much like the alchemists of old! They may grudgingly toil away at some job that allows them access to our favorite environment (the computer) or, TIME$() forbid, some unrelated menial task that may provide a survivalist income that barely supports our idealised world at home.

In any event, unless we happened to be born into a comfortable stipend, our lifestyle barely supports our fantasy of a carefree life dependent on the income from our endeavors.

It's Good Software!

The software these people often develop from personal inspiration to finished runtime package seldom, if ever, sees the light of day as more than freeware or shareware while producing little or no income.

Is this because the software we build is mediocre at best? High level or assembled trivia? Insignificant contributions to the realm of the bland or useless?

Is our effort lacking in colorful interface with no attractive bells and whistles? Text-button GUIs and single-word prompts? White-on-black displays for the same old data? We think not!

In some cases the above speculation may hold true. However, in most instances, the problem lies with marketing alone! There are many cliches in the world of marketing, such as selling "the sizzle instead of the steak" or "frame it any way you want—it's the siding and trim that sell the house..." and an endless array of other such quotes.

For the most part, these cliches hold true, much as it would be nice were it not so. But, aside from the color and variety we build into our packages, we are not actively involved in the marketing at the commercial level. We are, however, involved at the personal level. We must market ourselves!

Therein lies our great shortcoming. Unless, through some quirk wherein we have achieved some sort of positive notariety, we remain unknown and our

ariety, we remain unknown and our feeble attempts to interest any marketing or distribution firm in our work consequently go unnoticed or, at best, wind up overshadowed by the work of someone more gregarious or better connected that will be assigned a marketing priority.

The Key is Marketing!

The solution that comes first to mind is undoubtedly the one most of us find anathema. It lends itself least to practical implementation. That is, we should get off our duffs and begin to socialize. Yes, socialize! Get out there and promote our work and ourselves with the celerity of a Madison Avenue promoter! Exercize our latent wills and overcome whatever paranoias or neuroses prevent us from establishing a viable credibility.

The downside of this solution is that most of us have tried it with little success. We are not gregariously extroverted social animals and by dent of our appearance, demeanor, or some other personality trait, our efforts are doomed to fail.

Another, more viable solution is to establish a relationship with that tested source of representation—*The Agent*. The drawback here seems to be that there are no honest, reputable, sincere and available agents out there specifically for the benefit of our class of software engineer. There are, beyond a doubt, any number of well-connected professional people out there in the real world of commercial marketing who could well fit the bill, but locating some and convincing them to undertake such a scheme is another issue altogether.

One very real possibility now would seem quite feasible. What we need to do is become joiners. We need a place to bring our efforts to the attention of those who count, thereby becoming known.

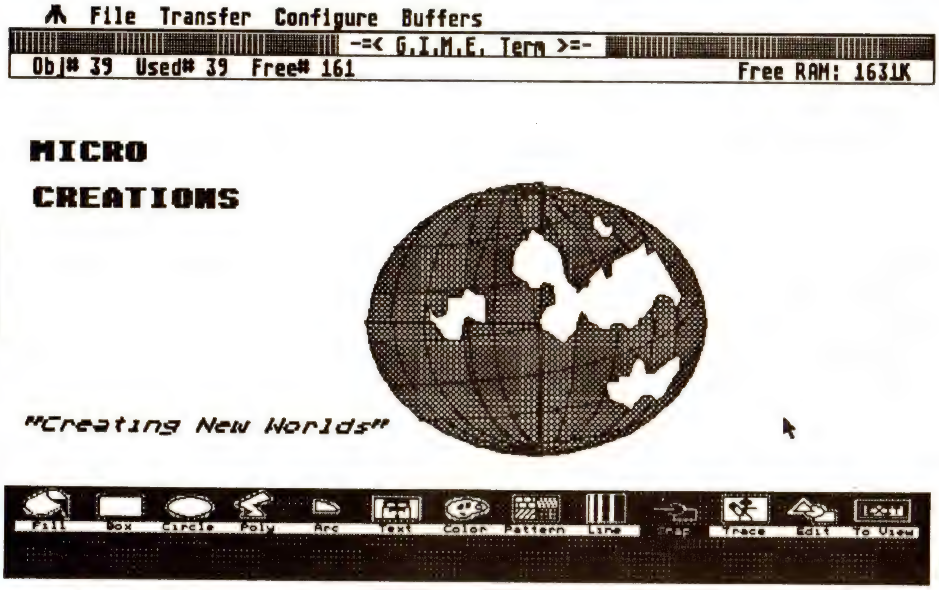
Several such established places have come to mind and the one that seems to ring the clearest is the Public Media. Within this province, we should seek out an online service where we might establish a Generic Software Developers' Forum.

For those of us unable to financially support regular participation at this level, there are any number of generic, as well as specific, professional journals where we might maintain a regular Exposure Column. Such a column might be in the form of a Q&A Forum that also lists all participants along with brief credentials and potentially marketable works.

Still, even if there were such 'tools' as these available to us—and there are specific Forums and Magazine Columns currently available—we are still faced with that bottom line which is the central bone of contention; we must make ourselves and our work known. If we do not make the effort to join in the discussions or present our work where it can be scrutinized by those in a position to promote it, nothing will change. To do this is a decision each of us must make on our own!

G.I.M.E. Terminal

Bob Retelle (WAUG)



```
Obj# 39  Used# 39  Free# 161                              Free RAM: 1631K
```

In the ST world, it's always good to see new and innovative programs, and the G.I.M.E. (Graphics Interface Modem Environment) Terminal program from Micro Creations is both of these.

Unfortunately, after using it for a short while, I'm not entirely convinced it's particularly useful, at least as an advance over terminal programs we already have.

As some of you may already know, I've been heavily involved in telecommunications for many years now, and one question I'm almost invariably asked is which telecommunications program I use. My answer, in 1986 when I first got my ST was the same as it is now. I use Flash, from Antic Software, exclusively. Thus, in any test or review of new telecommunications software, Flash would be my standard for judging the effectiveness and usefulness of the new product.

I've tried many different telecom programs, and always come back to Flash. That's not to say I wouldn't use a different program if one came along that was as easy to use as Flash and contained all its features; just that, so far, I haven't found such a program.

Features

G.I.M.E Terminal does indeed have several new features that Flash does not. Among these is the ability to draw and transmit graphic screens and a very extensive and powerful script language.

When you boot up the program, you first see the Capture screen. From here, you can access all the other screens and features. G.I.M.E. Terminal maintains the "Flash standard" of using the right mouse button to flip between the Capture screen and the Terminal screen. At the Terminal screen, pressing the left mouse button brings up the Dial Directory, again just like in Flash.

Each screen has the normal menu bar across the top with drop-down menus for functions which are common to all screens, and a graphics menu at the bottom with icons for specific functions on that screen. From the Capture screen, you can access the Text Editor screen.

Unlike Flash, you must leave the Capture screen to edit text. Instead of using one very large buffer, as Flash does, G.I.M.E Terminal provides four separate buffers, each of which is divided into "sub-buffers" as you add text and graphics.

The Text Editor provides the features you'd expect, including setting margins, changing type style and color, and importing and exporting text.

The Block icon brings up another menu of icons, revealing operations you can do on blocks of text. Among these operations are changing the case of the text, changing type style of just the block, cutting, pasting and deleting. Block save and load is supported, and you can send the block out the modem in several different formats.

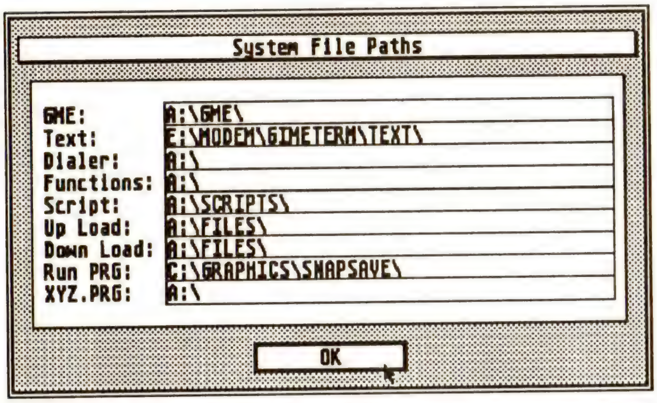
Two features I find very useful is the ability to strip returns from the block of text and to turn the scroll bar on the side of the screen on and off to give you a full view of the text. Unlike Flash, however, 80 columns is the widest you can set the margin.

Graphics

The Graphics screen brings up another icon menu displaying many different drawing tools for creating graphics in the Capture buffers. You can draw boxes, circles or polygons, either filled or unfilled, add text and change colors and patterns. Once a drawing is completed, you can edit it to change the size, color and orientation of the objects on the screen.

The graphics in G.I.M.E. Terminal are "object oriented," not the "bitmapped" style of a program like DEGAS. This is due to the way the graphics are transmitted by modem, and takes a little getting used to.

The drawing process is much



```
GME:        A:\GME\
Text:       E:\MODEM\GIMETERM\TEXT\
Dialer:     A:\
Functions:  A:\
Script:     A:\SCRIPTS\
Up Load:    A:\FILES\
Down Load:  A:\FILES\
Run PRG:    C:\GRAPHICS\SNAPSAVE\
XYZ.PRG:    A:\
```

more "CAD-like" than just freehand drawing. I find the pictures created with the tools available to be somewhat blocky and "stick-figurish" in contrast to a DEGAS or GIF image, although for its intended purpose—quickly transmitting graphics by modem—the pictures are quite acceptable.

One very interesting feature is the ability to "trace" an existing DEGAS picture in G.I.M.E. graphics. Unfortunately, the results are likely to be disappointing, depending on the complexity of the original DEGAS picture. The best you can hope for is a close approximation.

When you transmit a graphic image, the picture is sent, not as a bitmapped image, which would take 32K for a typical ST screen, but as a series of characters which "describe" the picture. It's interesting to watch as the sample graphic screen is loaded from disk, and drawn object by object.

Script Features

The powerful script language is essentially an implementation of the 'C' programming language, which is somewhat of a mixed blessing. It offers great power (you could probably actually write a terminal program in G.I.M.E. Terminal's script language), but it requires you to either already know 'C' or learn to program it before you can use the script language effectively. The manual describes the process fairly well, but it certainly won't be easy for a beginner to do anything very useful.

Bread and Butter

Well, so much for the fancy features, how about the "bread and butter" functionality of the program—its ability to send and receive data by modem?

The menubar has all the normal functions of a telecom program, including a few that Flash is lacking. Under the File menu item is a selection for Disk Utilities, which gives you access to things like selecting a drive, getting a disk directory, showing free space on the disk, renaming and deleting files and the main thing Flash is lacking—the ability to format a disk.

Also under the File menu is Load and Save, which are used to access and save the Capture buffers, the phone Dialer, Function Key definitions and the Printer and terminal configurations. You can Run an external program or script file on disk or run a script file in memory.

The Transfer menu item lets you Send text in ASCII or run the external transfer program. G.I.M.E Terminal does not have any transfer protocols built in. Instead, it uses a customized GEM version of the popular XYZ.TTP program to do its uploading and downloading. While this gives the program the flexibility of being able to update to new protocols by only changing the external program, it can be *very* slow if running from floppy disk. You have to wait while the external protocol program is loaded from disk every time you want to download or upload.

One outstanding feature of G.I.M.E. Terminal is its dial directory. The directory lets you create subdirectories, or folders, to organize your dialing. For example, if you have a number of BBSs in California that you call regularly, you can create a directory called CALIFORNIA that contains only those numbers.

Finally, from the main menubar, you can select which of the four Capture buffers will be open to receive text from the terminal screen, and which of the four you will be working in on the Text or Graphics screens.

As mentioned earlier, pressing the right mouse button brings up the terminal screen, where all the real action takes place. A status bar at the top tells you which Capture buffer is open and both the current time and amount of free RAM available.

Interface

So, why won't I be using G.I.M.E. Terminal in the future, even though it does have some features lacking in Flash? Well, for one thing, I disliked having to switch to the Capture screen to do basic things like looking at a disk directory or even to turn the capture buffer on and off.

While the Text editor, Graphics editor and Capture screen all have ALT key combinations to access the menu items, the Terminal screen does not. Flash allows both a "command line" interface for most functions and ALT key combinations for many.

For example, getting a disk directory in G.I.M.E. Terminal involves returning to the Capture screen by pressing the right mouse button, selecting the File menu item, then clicking on Disk Utilities (or pressing ALT SHIFT T), then clicking on the Select Drive button (if you'd like to see a different drive from the current one), selecting the drive button, then clicking on Directory.

If you use the Universal Item selector, or have another item selector that lets you choose drives, you could skip the Select Drive step.

In Flash, the same operation could be done by pressing the Insert key, then typing DIR A: on the command line. Likewise, turning the Capture buffer on and off in Flash is a simple matter of hitting ALT C. (Of course, if you *must* use the mouse and GEM functions, you always have that option too in Flash.)

Performance

Ok, so in my opinion, G.I.M.E. Terminal feels more awkward to use than Flash. How does it perform online?

Well, as you again may know, I'm a Sysop in the Atari Forums on CompuServe. As such, I do a lot of downloading to check out files, so naturally my first call was to CIS. While the manual mentions GEnie and BBSes, it soon became apparent that G.I.M.E. Terminal hadn't been tested on CompuServe. The first thing I discovered was G.I.M.E Terminal has no provision for stripping the "high bit" from incoming characters, which results in a real mess on the screen if you log on using RS-232 parameters of 8 bits, No Parity.

Ok, so I called back after setting to 7 bits, Even Parity. Much better, perfectly readable text this time. The next thing I tried was to download a file. Using the 1K XMODEM option in XYZ.PRG, I started the download, and waited...and waited. No luck, so I tried again. Still nothing. Finally, it dawned on me that G.I.M.E. Terminal was not switching automatically to 8 bits for the transfer, as most terminal programs do. CIS was going into 8 bit mode, but my end was still at 7 bits, which just doesn't work.

I finally did manage to get G.I.M.E. Terminal to download from CompuServe, but this was the procedure: First, in 7 bit, Even Parity, I had to tell CIS to send the file, then quickly hit the right mouse button to go back to the Capture screen, where I had to pull down the Configure menu and click on RS-232.

Once in that dialogue I had to change the Parity to None, and the Word Length to 8 bits, then exit out of that, pull down the Transfer menu and click on GIMEXFER.EXT. After waiting for XYZ.PRG to load, I had to click on Xmodem because it defaults to Zmodem every time (even having saved the options to disk), then click on OK...and then pray that CompuServe hadn't timed out already.

Once the download completed, I had to run through the same procedure to set the parameters back to 7 bit, Even Parity so I could once again read the screen. And this had to be done for *every* file I wanted to download. Needless to say, I won't be using G.I.M.E. Terminal for CompuServe.

It looks as if there are script files for most of the normal (DIR, Diskfree, etc) functions, including the one I need, already on the disk, although the manual makes no mention of how to use them.

The Manual

Sigh...the manual. Until I read the G.I.M.E. Terminal manual, I thought the original GFA BASIC manual, roughly translated from German, was the worst manual I'd ever read. I was confused several times while reading some of the sections, and remember, I'm not exactly a beginner in telecom. The style and grammar are somewhat rambling and annoying.

Maybe it's just personal taste, but when documentation of the Transfer dialogue box goes off on a tangent to describe the whole world of BBSes and how wonderful it is to be able to download thousands of programs right into your own computer, instead of just describing the buttons in the box and telling you how to use them, it's a little irritating.

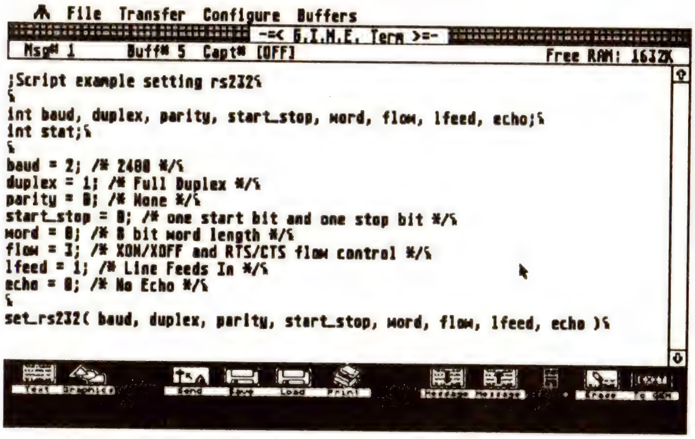
It also would have been much better if the manual had been proofread, preferably by someone who knows something about grammar. Just spell checking isn't enough.

Especially irritating were the dyslexic mistakes dealing with where things are on the screen. I fumbled around a bit in the Dial Directory when the manual told me to double click on the folder marker to the right of the folder to delete. I couldn't find anything to the right of the name, but clicking to the *left* finally did the trick. Then, the description of the Exit icon says it's standardized throughout all the screens...at the far left of all screens. Well, not exactly. It's at the far *right*. Maybe it's just being picky, but I usually expect a commercial product to be better than that.

Speaking of commercial products, it's *really* annoying to see misspelled words on the screen, especially if it's a commercial program. I don't know if Micro Creations is responsible for the screens in the XYZ.TTP program or not, but it's "I before E, **except** after C" when you're spelling "Receive." I have to wonder who caused the mistakes, since the name of the XYZ.TTP programmer is also misspelled.

Lastly, while the graphics features of G.I.M.E. Terminal are interesting, they're only useful for transmitting graphics to another G.I.M.E. Terminal equipped ST. To anyone else, the graphics come across as garbage. Micro Creations is apparently working on a BBS program that will use the same graphics, but until they become commonly available, the graphics capabilities in G.I.M.E. Terminal will remain an interesting curiosity.

I might be able to recommend G.I.M.E. Terminal to someone who never plans to use CompuServe, who likes to do a *lot* of mousing and clicking, and who knows 'C' programming. As I mentioned before, I plan to continue using Flash.



```
;Script example setting rs232␍
␍
int baud, duplex, parity, start_stop, word, flow, lfeed, echo;␍
int stat;␍
␍
baud = 2; /* 2400 */␍
duplex = 1; /* Full Duplex */␍
parity = 0; /* None */␍
start_stop = 0; /* one start bit and one stop bit */␍
word = 0; /* 8 bit word length */␍
flow = 3; /* XON/XOFF and RTS/CTS flow control */␍
lfeed = 1; /* Line Feeds In */␍
echo = 0; /* No Echo */␍
␍
set_rs232( baud, duplex, parity, start_stop, word, flow, lfeed, echo )␍
```

THE FONT RESOURCE

The Font Resource spotlights some of the latest font releases for your favorite ST DTP packages.

This month, we feature two more of the many disks available from Computer Safari under the Safari Fonts title.

Computer Safari is, by far, the most prolific font supplier for PageStream. In fact, most of the font disks sold by Soft-Logik actually originated from Computer Safari and its president, Jay Pierstorff.

Many of the newest Safari Fonts disks contain font versions for both Calamus and PageStream. The quality of all their fonts is excellent. You really can't go wrong with any of them!

For purchasing information on any of the fonts showcased here, or for details on other font disks, contact Computer Safari, 606 W. Cross St., Woodland, CA 95695, phone (916) 666-1813.

AIM
ST Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the September '91 disk. For more complete docs, see the text files contained in most of these archives.

BACKGAMN.APP—Online backgammon, lets you play over the phone lines with a friend and a modem. You can also play against the computer or set up custom games. Mono only.

CRYPTFNT.APP—Two complete fonts for PageStream. Contains the .FM (font metric), .DMF (dot matrix), .HI (screen), .PSF, PFA(type 1), and .PFB(type 3 for Ultrascript) files. Cotton is caps only and Crypt, which looks like 'Tales from the Crypt' contains upper and lower case. Shareware.

DCGTP.APP—DC GTP (GEM Takes Parameters) allows you to enter a command line (or use the file selector to choose a file parameter) for GEM programs. This is similar to the NewDesk (MSTE and TT) new program type .GTP extension. 100% assembly, ST, STe and TT compatible from Double Click.

DCHOMEY.APP—DC Homey lets you find your mouse instantly! Just press <ALTERNATE>+<CONTROL>+<LEFT SHIFT>+<H> at any time and your mouse is centered on-screen. Great for STacy owners. 100% assembly, ST, STe and TT compatible from Double Click

DEMOLITN.APP—DEMOLITION MAN, a commercial-quality game by Clayton Walnum. Try to discover where the bombs are hidden, without blowing yourself up! Low rez only. Shareware.

DIRDRIVE.APP—Direct-Drive makes managing files on floppy or hard disk simple, quick and painless. Disk librarian that can handle any drive. Lists can be saved, searched, sorted and printed. You can also print disk labels, format disks and much more! Runs in any resolution with at least 80 columns. Shareware from Robert Birmingham and Dave Groves.

DOUBLE.APP—Double the number of lines of resolution on your screen—color becomes 640x400; monochrome becomes 640x800! Shareware from Lars-Erik 0sterud of Rykkinn, Norway. Works only on STEs or newer systems.

FORTRAN.APP—Full FORTRAN 77 package with compiler, linker, runtime and math libraries and manuals (German and English). Use of this package is restricted to non-commercial, non-military uses.

MATHQUIZ.APP—MATH-QUIZ provides an excellent vehicle for your child's math skills intact during the summer months. The program encourages frequent use and good performance. Medium rez only.

MDATE.APP—Make*A*Date is a Scheduler/Diary/Phone Book/Notes Database and TODO List manager rolled into one. The package is built around a Desktop that can be set up to run external programs.

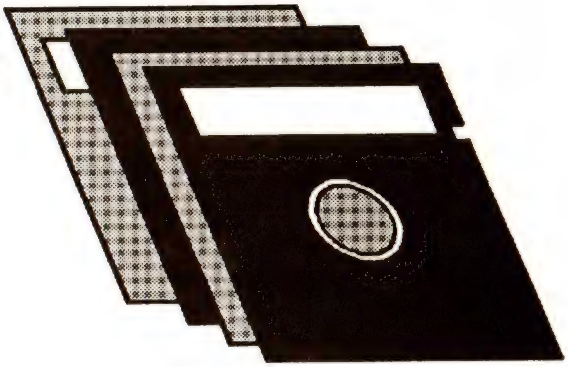
SCSIBOOT.APP—Fixes double-booting syndrome with SCSI hard drives. Shareware by Art Zeigler. (This program was mentioned in the Aug. '91 issue of Atari Interface.)

SILKMOUS.APP—Provides smooth, resolution-independent acceleration far superior to anything offered by other mouse accelerators. This is a Configurable, timed demo. Get the "uncrippled" version for only $10.

ZESTPOKR.APP—Here is another demo using the ZeST interface (NeXT look-a-like). This mono game gives you draw poker, high card and a one armed bandit. Freeware. Have fun!

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the September '91 disk when ordering.

AIM 8-Bit
Disk of the Month
September 1991



Each AIM 8-bit Disk of the Month is a single-sided, single-density "flippy" packed with software. To extract files in the ARC format, you need the UNARC.COM utility and to decompress files with a DCM extension, you need DISKCOM3 .UTL (available from most BBSes, user groups or on the April/May '91 AIM 8-bit Disk).

Here's a short description of the files on the September '91 disk. For more complete documentation, see the text files contained within most of the ARChives.

Side 1

BIBLE1.ARC—Two complete Bible verse games in BASIC. README file explains how to add your own verses to the game/create new ones. Also, see BIBLE2.ARC on Side 2.

MMRG22.ARC—Mail Merge macro system for TextPro 4.56XE! Put your mail list in one bank of memory and your letter in the other and press START. Docs included.

RGBPAINT.ARC—A 4096-color drawing program for the 8-bit! Requires MYDOS, Jeff Potter's COLRVIEW, Turbo Basic's RUNTIME.COM and at least 128K to run. Pressing SHIFT-? gives you a built-in help screen.

SPACEGAU.OBJ—PD game written in 1984. Unfortunately, the programmer chose the name GAUNTLET, and due to the appearance of the arcade game of the same name, it passed into obscurity. Complete docs enclosed.

Side 2

BIBLE2.ARC—Two more complete Bible verse games in BASIC. Test your knowledge of "the good book."

KERMIT65.ARC—Version 3.7 of Kermit 65, an 80-column telecom program. Docs in the ARC describe some changes and the program in general.

PSTODD3.ARC—Useful utility to convert PrintShop icons for use with Daisy Dot III. Program by John McGowan. [NOTE: This program was listed on our June '91 disk, but there wasn't enough space left on the disk for the complete program. So, here it is in its entirety.]

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the September '91 disk when ordering.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, from 6:30 to 9:30 PM. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Library of about 700 disk titles. Each month we publish (FR)ANTIC covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

AACE

ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

President	Richard M. Houser	(505) 299-3977
16bit Vice President	Everett Schnetzer	
8bit Vice President	Ed Skeans	
Secretary/Treasurer	Mike Evans	

General membership AACE members meet twice monthly, on the first Saturday and third Tuesday of each month. An 8bit meeting is held on the second Tuesday of each month. On the first Saturday of June and December, a Swap Meet is held. Dues are $20 a year payable in January. Members receive an AIM subscription, access to our 16bit and 8bit PD library and membership in the ASTRO BBS (505) 260-0448 Club membership is at an all-time high of 36.

AUSTIN ATARI COMPUTER ENTHUSIASTS AACE

Our new slate of Officers has generated some new activity in the Club. We have a new MIDI SIG that is six months old, and have just started our second C class. This one is different, part tutorial, part hands on. The only problems were installing the new compiler for the 8 bit users and getting the Mark Johnson C in the ST library to work at all(we didn't have anyone who spoke fluent UNIX). All in all this class was more fun than the last one.

We are still looking for a semi permanant meeting room. All of the options turned into duds because of location, size, parking, and most importantly-liability insurance(it's a killer). But we'll meet the first Wednesday since it's time for a change. Our current meeting is a combined Disk Party, General Meeting, and Officers meeting, but it gets kind of cramped both in space and time.

Both our ST and 8 Bit libraries have been revamped, with more changes coming. They will be easier to access, and have more data per disk at the same price-the ST will be double sided and the 8 Bit will be flippy(SD). 8 Bit lists are available, with new disk update lists printed as needed. Early summer should see the 8 Bit library finished with more new lists printed. Also in early summer will be the AUSTIN COMPUTER FAIR. We have attended that in the past and may this year provided we can get a lot more volunteers and more organised than last.

The Atari Clubs of Denver is an umbrella group consisting of: Atari Club of Denver, Starfleet User Group and the ST Interest Group. Atari Club of Denver meets the first Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7:00 PM. Starfleet User Group meets the second Friday of each month. We meet at Pamona High School 8101 West Pamona Drive in Arvada, Colorado. The meeting starts at 7:00 PM.

Atari Club and Starfleet provide support for Atari 8-bit owners.

ST Interest Group meets the third Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7PM. The ST Interest Group provides support for the entire ST computer line.

Our address is: Atari Clubs of Denver POBox 24064 Denver, CO 80224. For additional information call our BBS at (303) 343-2956, 24 hours, 300-2400 BPS.

ACCEPT

Atari Computer Club of El Paso, Texas

ACCEPT (Atari Computer Club of El Paso Texas) ACCEPT is the only Atari club in the entire El Paso southwest. Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT 10953 Yogi Berra El Paso, Texas 79934

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCEPT executive committee Steve Bruck, Tim Holt, L.R.'Pete' Rosh, Dave Davis

ACCT

Atari Computer Club of Toledo club members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher cost.

ACCT meets on the second Monday of the month, from 7-9 pm at Bassett's Health Foods, 3301 W. Central Ave (Westgate Shopping Center), Toledo, OH. ST Sig held monthly at the home of David and Brenda Micka. Dates and times announced at meeting. ACCT may be contacted at 4487 289th, Toledo, OH 42611 or by calling Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

Bob Haynes	371-1726	Archivist

ACCESS -- The Atari Computer Club Encompassing Suburban Sacramento. As usual, please call any officer if you need information, directions or even to make a suggestion. Or, you can call the ACCESS BBS at (916) 428-8662.

For those of you who don't know who we are, ACCESS is the Atari 8-bit user group for the Sacramento, CA area. We provide help and information to the local Atari community. We offer a number of meetings each month to give you more information on your computer and to answer your questions. And, of course, we are anxious for you to share what YOU know, since there always seems to be something new and fascinating in the Atari world.

Our general meeting is at 7:30 PM on the first Wednesday of each month in Classroom B of the SMUD training building at 1708 59th St, between Folsom Blvd and R Street, just off Highway 50. This is our main get-together.

Other monthly meetings are held on the following three consecutive Tuesday nights at the homes of Barry Gordon (Modem SIG), Bob Drews (Board of Directors Meeting), and Tim Naber (Disk SIG). Telephone them for additional details, but we hope you can be a part of these groups.

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, 1150 Winton Road South. An ST Beginner's class starts at 6:45, while our 8-bit 'Basically Speaking' class starts at 7:00. Our general meeting starts at 7:30pm in room 262S, with a split into ST and 8-bit SIGs at 9pm.

ACORN has both an 8-bit and ST PD software library. Over 300 8-bit disks and over 100 ST disks are available to any individual. We operate the Dimension's End BBS at (716)436-3078, 300/1200/2400 baud, 40 MB of online PD and shareware files. Membership in ACORN is not required to access the system.

Membership in ACORN is $18 per year, and entitles you to a year's subscription to both the ACORN Kernel newsletter and the Atari Interface Magazine, 12 meetings, access to our 8-bit and ST PD libraries at reduced cost, and special access to our BBS. Our mailing address is: PO Box 23676, Rochester, NY 14692-0676.

President	Don Allis	(716)293-3415
Secretary	Chris Freemesser	(716)328-1703
Treasurer	Sam Duck	(716)461-0544

ACUNet

Atari Computer Users Network

Salem, Oregon

ACUNet is the Atari Computer Users Network in Salem, Oregon. The key word in our name is "network." We are here for anyone who has an interest in actively networking with others interested in Atari computers. (It only works as well as we all make it work together, folks!) The #1 benefit of membership in ACUNet is tapping into the knowledge and talents of one another -- at our monthly meetings, via BBS, in our newsletter, one-on-one.

Annual dues are $15 with an AIM subscription and $10 without. Our meetings are held the fourth Tuesday of the month at 7:00 p.m. Call Ron Purdy, ST Co-Chair at (503) 588-7509 for the current meeting location and other information.

Local BBS support includes the Atari SIG on the Salem Public Library BBS - (503) 588-6130, Page BBS - (503) 363-0171, and The Jungle BBS - (503) 393-4274. Want more information about ACUNet? Write to Ron Purdy, 2662 East Nob Hill Drive SE, Salem, OR 97302.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

Central Connecticut Computer Club

The Central Connecticut Computer Club is the oldest, still operational Atari club in the state. Conceived in December of 1980, and operational in January of 1981, the CCCC continues to serve the Atari community. New blood is welcomed, and of course, old hands are always welcomed back.

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at 127 Pinnacle Rd., Bristol, Ct. 06010

Prospective members may call Rich Scheidel (203)589-3738 or call Gary Jones (203)225-4611, or write, CCCC, 127 Pinnacle Rd., Bristol,Ct. 06010.

Dues are $25 per year,$30 for families. Includes Voting membership, Atari Interface magazine, access to Club library (8-bit and ST) and access to the Club magazine library.

CDACE

Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held four times a year on a quarterly basis and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, N.Y.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST disks are priced at $2 while the XE library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter. The club actively promotes the use of all Atari computers through demonstration and application and welcomes non-members as well as members to visit a meeting and share ideas.

President	Bob Thompson	518-439-5356

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

The GTAUG has been 'around' since 1981 and supports both the : and 16-bit communities. Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. Since our nearest dealer is 90+ miles away, it is imperative that we support each other. It is for this very reason our group is a fairly close and diverse. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

Long Island Atari Users Group

Long Island Atari User Group, PO Box 92, Islip, NY 11751. For information, contact John Aalto at 516-589-6754 or call STar Scan BBS at 516-399-4252.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

Members of MACE receive, as part of their dues, Atari Interface Magazine. Members are also entitled to purchase disks from the 8-Bit and ST public domain software libraries. 8-Bit disks are $3 each, and ST disks are $4 each. As an added bonus, if you purchase three (3) disks from either library you will receive a fourth disk of your choice at absolutely no cost. Non-Members may purchase disks at a slightly higher rate. Mail order is also available.

For a catalog of current disks in our libraries, send $2 to:

MACE, P.O. Box 2785, Southfield, MI 48037

MACE meetings are held on the Third Tuesday of each month at the Southfield Civic Center at 7:30pm. The Southfield Civic Center is located at 10 1/2 Mile and Evergreen Rd, one half mile south of the Evergreen exit on the new I-696.

Meetings are in the small pavilion, room 115. Parking is available in the parking garage below the pavilion or in one of the many parking lots on the Civic Center grounds.

MID-OHIO ATARI USER GROUP

Mid-Ohio Atari User Group (MAUG)

MAUG meetings have returned to A&B Computers, 1151 Park Avenue West, (West Park Shopping Center) Mansfield Ohio, from 7:00pm until 9:00pm, on the third saturday of each month (except July). If you are unsure on how to get there, call A&B at (419) 529-9999. If you have questions relating to MAUG, call Chuck Steinman at (419) 529-2478 (after 5pm).

ST and 8-bit downloads for MAUG members have returned to the DataQue Support board, so check them out! Included are the most recent AIM ST and 8-bit disks of the month, and other interesting files. Only MAUG members in good standing have access to these files, so make sure your have your dues paid! The DataQue support board runs 24 hours, 300-2400 Baud, and the number is (419) 529-5197. Make sure you indicate you are a MAUG member so that MAUG access will be granted.

General topics of discussion at the montly meeting are the contents of the AIM disks, recent news and events. Of course demonstrations of new hardware and software are appreciated!

Middle Georgia Atari Users Group

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Rockford Atari Computer Club is comprised of avid, dedicated users of all Atari computers. We support and promote the use of 8-BIT, and ST/MEGA machines with extensive PD libraries, monthly meetings, and semi-regular SIGS.

We have had a change of meeting place this year, as our previous site is being used for adult education on Saturdays. We may be able to secure a regular space there, if we can agree to meet at some other time/day (possibly evenings?). Any suggestions, or other alternatives should be mentioned at the meeting. Our regular business meeting is held from 9 to noon, the third Saturday of the month.

We have accepted the gracious hospitality, of the Springbrook Congregational Churches as an alternative meeting place. It is located, off Alpine, just as you make the turn onto Springbrook road, from Spring Creek road. Our mailing address is 3902 15th Avenue 1 - Rockford, IL 61108. Our phone number is [815] 397-5316.

Rushi asts
9512 A Adams Dr. Ellsworth AFB, SD 57706

The Rushmore Atari Computer Enthusiasts is a nonprofit organization of Atari computer owners not affiliated with Atari Corp. Meetings are held on the fourth Saturday of each month, 2pm, at the Rapid City Public Library. Annual dues are $12 for basic membership and $15 for membership and newsletter (subscription to AIM!). S.A.G.E.
SPECTRUM ATARI GROUP of ERIE

SAGE, PO Box 10562, Erie, PA 16514-0562

The Spectrum Atari Group of Erie, PA was founded in December of 1984 to provide communication and support among owners of all Atari computers. Our newsletter is the SAGE Scroll which is published monthly. In addition to being distributed to all of our members, the Scroll is exchanged with over 50 other Atari computer user groups nationwide. SAGE maintains extensive libraries of public domain software for both the Atari 8-bit and ST computers.

The Spectrum Atari Group of Erie meets on the third Sunday of each month at 2 PM at St. John's Lutheran Church in Erie, PA. We also have SIG meetings monthly covering Telecomputing, the ST/Mega/TT computers and programming in GFA BASIC.

President	Dennis McGuire	814-833-4724
Vice-President	Patti Irwin	814-825-0834

SCAT SUBURBAN CHICAGO ATARIANS
AN INDEPENDENT COMPUTER USERS GROUP

SCAT (Suburban chicago Atarians)

SCAT general meetings are held on the third Saturday of each month at 10AM, unless otherwize indicated on the SCAT BBS. The location for the meeting is College of Dupage, Student Resource Center, Lambert Road between Roosevelt and butterfield Roads, Glen Ellyn, IL. SCAT is a not-for-profit computer group for the purpose of helping people better understand and utilize Atari 8 Bit/16 bit/32 bit series of computers for business and pleasure. Meetings are open to all.

Membership dues are $20 per year per family. Membership benefits include subscription to Atari Interface magazine (AIM) and special club events. SCAT and AIM are not affiliated with Atari Corp. in any way.

Anyone wishing to become a member can just come to a meeting and sign up or call SCAT's 24 Hour Bulletin board (708) 231-7227 or write SCAT, P.O. Box 72266, Roselle, IL 60172

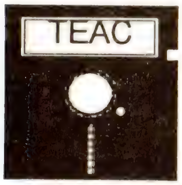
BitStream BBS		(408) 449-2150

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group was formally created in April, 1985; prior to that, local Atari enthusiasts met on an irregular basis. The group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. SWAG started out with a large following of 8bit owners and as more and more members upgraded to the Atari ST, the membership has become mainly ST owners, but 8bit is still supported. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
Steve Traxler	Vice President
Gary Lentz	Sec/Tres/Librarian



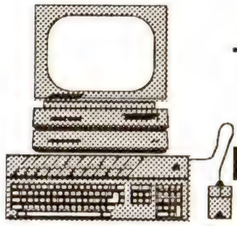
TEAC
The Educator's Atari Club

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

TACE
TINKER ACE OF OKLAHOMA

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 104 E. Northrup, Midwest City, OK 73110 or at the TACE BBS (405) 755-9561, 24 hrs., 3/12/2400 baud, running Oasis 4.3 software with over 60megs online storage. ST & 8bit support. Dues: Full - $20, Correspondence - $15. Dues are prorated at $1.25/month for correspondence membership and $1.66/month for full membership.

President/VP	Greg Ray	(405) 964-3765
Librarian	Chris Hamilton	
BBS Sysop	Rick Spencer	
Technical Advisor	Ron Hamilton	(405) 387-5649



THUNDER BAY ATARI ST ENTHUSIASTS

TASTE--Thunder Bay Atari ST Enthusiasts was formed in October, 1987 by a core of 5 ST owners interested in forming a user group to help each other and to help in publicising the Atari 16bit machine.

We grew fairly quickly to an all-time hig of 20 members by January, 1990. A monthly newsletter was published, and we established a PD library. Soon after, membership began to decrease -- members were getting to know their machines better, and lack of interest in publising a newsletter. We still have our PD library of about 70 disks, and will be adding to the list as we go along.

Thunder Bay is a city of 113,000 located on the norther shore of Lake Superior. We have one Atari dealer; is his also a dealer for the Amiga and IBM clones. Needless to say, the priority for Atari products is the lowest. We manage to stay alive monthly by mail order purchases -- unfortunate by necessary.

President, Neville Denetto, 185 Varsity Row, Thunder Bay, Ontario, Canada P7B 5P2.

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

Founded in December, 1983, WACO boasts huge ST and 8bit PD libraries. Double-sided disks are only $3 for members, $4 for non-members. Disk catalogs on disk are only $2. The $20 annual membership ($24 for family) now includes a subscription to AIM, as well as the vocal, consumer-oriented WACO Printout newsletter which features Z*NET. Memberships by mail are welcome.

WACO also operates the WACO Ward BBS, 300/1200 baud. The club was founded to help Atarians support each other. One of the regular features of each meeting is called "Upload" when members share new information or ask for assistance in solving questions. Both 8bit and ST disks-of-the month are demoed as well as new hardware and software.

Since the first Taricon back in 1984, WACO has been represented at most of the northeastern Atari shows as well as having a booth at all Pittsburgh shows.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 994-5619 or by BBS at Molin's Den at (313) 451-0524.

WAUG

Windsor Atari Users' Group

The Windsor Atari Users' Group (W.A.U.G.), founded in 1982, is among the oldest computer clubs in North America to serve the Atari community. We are an international family of Atari owners with members from across Southwestern Ontario and the state of Michigan.

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'. In addition, each membership gives you access to our ever growing public domain library, packed with programming from around the world. Each club disk sells for $4.00 (Canadian) with the occassional monthly special as offered by our club librarians.

New from Goldleaf Publishing

Goldleaf is now distributing and supporting the entire line of HiSoft products.

HiSoft
High Quality Software

DevpacST™

DevpacST is an easy to use integrated 68000 assembler, linker, editor, and debugger. DevpacST is designed for the novice and expert alike and comes with excellent documentation. Runs on any ST with at least 512 K RAM and floppy drive.
SRP: $119.95. Special Price: $95.95

DevpacTT™

The professional 68030/68882 assembly language platform designed for the Atari TT and all of its features. Comprising a multi-window editor, 680x0 macro assembler, fast linker & powerful symbolic debugger, DevpacTT gives you all you need to program efficiently and quickly on the TT.
SRP: $249.95. Special Price: $199.95

Lattice C (Version 5)™

The fastest and most complete C programming environment for the Atari. Lattice C comes complete with editor, shell, linker, compiler, global optimizer, resource editor, and libraries for GEM, Unix, ANSI, Lattice, and more.
SRP: $269.95. Special Price: $215.95

HiSoft C™

Designed for the beginning C programmer, this development tool features an integrated editing and debugging environment. Comes complete with on-line help, GEM toolbox, and a host of utilities. Runs on all STs.
SRP: $99.95 Special Price: $79.95

HighSpeed Pascal™

A complete, integrated Pascal compiler system, compatible with Turbo Pascal 5 on the PC. Very fast compilation speed with a multi-window interactive editor, linker, assembler and on-line help. Runs on all machines with at least 512 K.
SRP: $179.95 Special Price: $143.95

HiSoft Knife ST™

A complete disk recovery system for floppy and hard disks. KnifeST is GEM-based and includes a sector copier, a flexible disk formatter, a 'build file' function to recover lost files when FAT information is lost and much more. Comes complete with a comprehensive manual on the ST's disk operating system.
SRP: $59.95 Special Price: $47.95

Harlekin™

All the programs you're likely to need, in one desk accessory. Harlekin comprises a word processor, notebook/organizer, disk editor, calendar, RAM disk, printer spooler, terminal program, and more. Runs on any machine with a minimum of one megabyte of RAM.
SRP: $99.95. Special Price: $79.95

ProFlight™

Okay, so you're sick of programming. Take a break with ProFlight, the Tornado flight simulator. This highly realistic simulator lets you run a variety of missions from reconnaissance to heated battle. Hold on to your seats for this one!
SRP: $69.95. Special Price: $55.95

Please send me the listed titles. Prices include shipping. Please allow up to 2-3 weeks for delivery.

DISCOVER THE 4TH DIMENSION

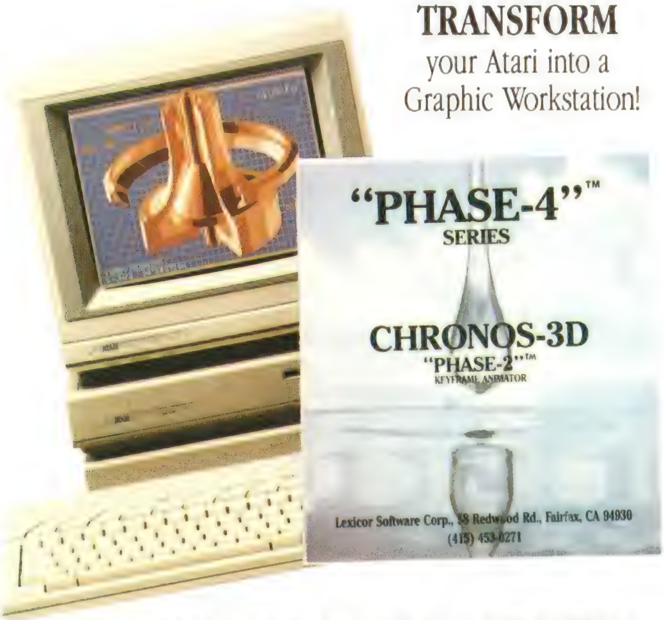
Explore computer imaging and animation in time and space.

RISE TO THE CHALLENGE

Chronos Key Frame Animator; creates a rich new environment for the computer animation enthusiast. Cut, copy and paste time and motion. View solid 3D objects in the past, present and future.

TRANSFORM

your Atari into a Graphic Workstation!

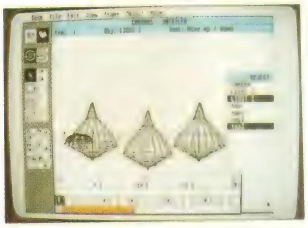


CHRONOS KEY FRAME ANIMATOR

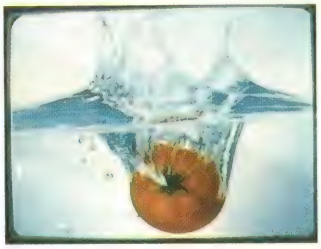
Object Motion Control Software Application

CHRONOS –

"The right program at the right time for the Right Computer". Now a flexible problem solving environment which totally eliminates the need for program control codes. Fully mouse driven system with keyboard support.



Unlimited Object complexity with no object face and point restrictions.



Create P.I.X.A.R. compatible files for Professional Graphic applications.

ATARI INTERFACE

Your Connection to the Atari Users Community

Publishers
Bill Rayl / Patricia Snyder-Rayl

Managing Editor — Patricia Snyder-Rayl
Editor — Bill Rayl
Contributing Editors
Dave Plotkin, Jay Craswell

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

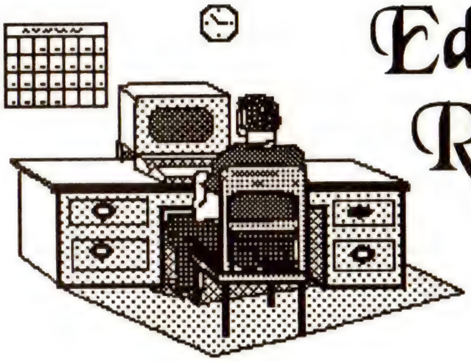
Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.



Editorial Ramblings

OCTOBER MARKS THE fourth anniversary for Unicorn Publications. We became official publishers of Michigan Atari Magazine in October, 1987, taking over from John Nagy. The magazine started with 10 clubs located in Michigan and has evolved steadily into what you see now—over 80 clubs from around the globe and color covers!

This is quite a ways from the December issue we published in November, 1987. Improvements in DTP packages, advertisers (both steady and occasional) and friends with a hand when we needed it most along the way have made the magazine you hold possible.

Support from the clubs over the years has been great, even recently when we were having problems with delays with the magazine. The first club outside of Michigan to join (TACE in Oklahoma) is still with us, and others (ACCT, COAC, LACE, MAUG, PACE, RACC and the El Paso club to name just a few) have been with us for a few years now.

Also special this month is the introduction of our Mac/Spectre Disk of the Month. These will contain programs (shareware, public domain and demos) for the Mac and have been tested with Gadgets by Small's Spectre Mac Emulator. The disks are double-sided; all files are self-extracting archives; and, disks are available in either Mac or Spectre format for those with older emulators.

The price for a subscription to the Mac/Spectre Disk of the Month is $50 for 12 disks, with a subscription to AIM (which is an additional $18 to US addresses), and $60 if you want the disk alone. We accept checks, money orders and cash (in US funds)! Subscriptions should be sent to 3487 Braeburn Circle, Ann Arbor, MI 48108. Our phone number is (313) 973-8825.

Bill & Pattie Rayl

From The Reader's Viewpoint

Dear Editors,

Hello again. Last week I sent to you $6 for a trial gift subscription to Atari Interface Magazine for my brother Richard (who had been a STart subscriber). While I was waiting for you to get that started up, the August issue of AIM turned up at Walden Software in Eastgate Mall—and I discovered that you had the latest version of ST Writer on that issue's disk. So I'm going to send you another $6 for the August 1991 Atari ST disk so I can get at least that program upgraded this year.

We were clearly hit with a blow when STart magazine went on hiatus (I had 19 issues left on my own subscription, which included disks), but this has been a bad year for magazines in general.

I found it ironic that someone complained in the "Dear Abby" column in the newspaper that so many magazines devoted as many as half their pages to advertising while so many other magazines ended up folding because of lack of advertising revenues.

Interestingly, back in my 8-bit days, I would buy Antic magazine just to get the ads from the mail-order companies that would advertise in it because Atari 8-bit software was very hard to find in my area, even then.

I learned from another computer magazine earlier this year that when a recession adversely affects a mail-order company, it will often cut back on its advertising, which was bad for STart, and also for me because I end up being left uncertain whether that mail-order company is still in business.

True, my present financial circumstances have forced me to postpone a number of planned ST hardware and software purchases, but those circumstances will pass. And when I am ready to buy again, I want to be hearing from those whose offers I might want!

Meanwhile, I'l have to try to keep this 520STFM of mine going with what I have. It seriously needs a hard drive, but even under more favorable financial circumstances, that purchase is a question mark.

I may be better off moving up to the faster Mega/STE if excellent software for it can be made available in this country. Otherwise, I'll have to go the IBM or Macintosh route, an option I'd rather not take because good programs for those machines are so expensive.

So, let's hope that you can keep going, even in these difficult times, and I'll be looking forward to receiving my AIM ST disk for August and sneaking a peek through my brother's Atari Interface as well.

Michael Brandenburg
Covington, KY

Michael—Thanks for sharing your views and support with us. The slowing economy did hit the computer industry pretty hard, and was especially tough on the Atari market which was already down.

STart's "demise" also sent a shockwave through the community that is still reverberating. Things look to be picking up slightly again, so hopefully the worst is past.

The Mega/STE is an excellent machine; we own one and reviewed it in the Jan. '91 issue.

Dear Editors,

I'm using my ST to write this letter that I've wanted to write for months.

What is the one thing that holds Atari owners together? Magazines.They reach into the homes of over 100,000 Atari owners. But, they are dying off quickly.

If you don't have a subscription to an Atari magazine, get one. If you already have one, get another and get a disk with it if you can. Don't be cheap! I get Atari Interface, Current Notes, Atari Explorer and ST Informer. The total bill for one year is around $70. And I get great coverage of events, hardware and software reviews.

I have all my magazines saved so if someone asks about a certain topic, I can usually find it. If you can't force yourself to hold on to your Atari magazines, put them in a library, doctor's office or anywhere the general public can find them. You may want to staple an ad for your local Atari dealer to them, if you are fortunate enough to have one.

If you flip through your disks, I bet you'll find a pirated program somewhere. Let's face it, that's not cool. Do me a favor...stop reading this and go erase all your pirated software now. Please! One reason Atari is loosing software makers is they aren't getting the business because many people used hacked software.

Join a user group. Attend area AtariFests. Spend a few bucks and support your local dealer and Atari BBSes. Any combination of these actions will help Atari and will be very rewarding and fun.

Ryan Thorpe
Oswego, NY

ATARI BULLETIN BOARD

STBook

Although no release date or pricing has officially been announced for the STBook, Atari's Don Thomas released some specs for the Notebook computer recently on CompuServe.

The 8.5"x11" STBook, in its current configuration, will come with MIDI IN/OUT ports, RS232 serial port, parallel port and floppy disk/DMA port. The keyboard includes 10 function keys and four cursor keys. A connector allows a standard Atari detached keyboard to be used.

An internal 2400 baud modem or 9600 baud FAX/modem will be available, as well as internal hard drive options of 40, 60, 80 and 100 megs.

The STBook runs on a seven 'AA' battery pack that provides 10-12 hours of operation. An optional rechargeable battery pack that recharges in two hours while the STBook is running is also planned.

The monochrome LCD screen displays 640x400 and is *not* backlit. A pressure sensitive Vector-Pad works as a mouse—the harder the pad is tapped, the faster the mouse pointer moves.

UNIX

Atari is also reportedly near releasing Unix System V for the TT. Dubbed ASV (for Atari System V), the package includes Unix System V release 4 with some BSD tools, X-Windows 11.4, Motif 1.1.2, GNU C++ and source level debugger, and NFS/RFS, an ethernet board that plugs into the VME bus.

A GUI called X-Wish running under Motif and X FACEMAKER, a tool for Motif programmers is also part of the package. The entire UNIX setup will come installed on a 320 meg internal hard drive on the TT/X for a total cost of approximately $5,000 retail.

News from CodeHeads!

CodeHead Software *is* developing a new ST product. MIDI Spy is a MIDI recorder desk accessory which records and plays back MIDI data in the background. MIDI Spy is always recording, so musicians never lose another valuable musical idea. Full details about MIDI Spy are not yet available, but we'll let you know more when they are.

The CodeHeads have also announced a major revamping of MultiDesk, called MultiDesk Deluxe. MultiDesk Deluxe gives the flexibility of Atari's XControl Panel, but with the ability to reuse your current accessories rather than limiting you to current CPX availability and feature limitations.

While retaining the features that have always existed in MultiDesk, MultiDesk Deluxe will give you an additional area for accessories to be loaded from disk whenever you need them. These non-resident accessories will all share the same memory area, allowing it to be reused without limit!

Explorer Deal

Until December 31, 1991, Atari Explorer is offering a 33% discount on Atari Explorer subscriptions to US Atari User Groups and CompuServe users. For just $9.95, you get six issues (one year, regular price $14.95) of Atari Explorer. For $24.95 you can get 18 issues (three years, regular price $39.95). If you already subscribe to Atari Explorer, you can take advantage of these low rates to extend your current subscription!

To qualify for the discount, send your name, address and a check or money order to Atari Explorer Discount Offer, P.O. Box 6488, Duluth, MN 55806. VISA/MasterCard orders, please call (218) 723-9202. You must supply the name of your user group or CompuServe ID number.

Atari Explorer is currently the largest-circulation magazine serving the US Atari market. Explorer covers the whole range of Atari products, from the 2600 and 7800 game systems, to the Lynx, the 8-bit line, the Portfolio and on to the ST and TT.

Sudden View

In August, Sudden Incorporated released a "commercial beta version" of their first ST product, Sudden View. Sudden View is a desk accessory/PRG text editor that "is remarkable for its fresh approach to editing fundamentals. It removes the metaphor that normally stands between the user and his text, creating a sensation of 'Live Editing'."

Sudden View features the ability to "dynamically scroll text and move blocks," and internal indexing of text files so the user can display any part of a file instantly. All deletes and changes are kept in a twenty element buffer stack, so the user can restore up to 20 "deletes" back.

A fully functional demo version is available for evaluation. The "personal," registered version sells for $69.95. For more information, contact Rod Coleman, Sudden Incorporated, 5081 South McCarran

Blvd., Reno, Nevada, 89502, or call 800-421-4228 or 702-827-2996.

EdHak Update

Clear Thinking has released an update to EdHak, their popular text/disk/memory/anything editor that runs as a program or desk accessory. Version 2.2 is compatible with all TT resolutions and interfaces with the latest version of QuickCIS, giving CompuServe users a full-featured editor for creating their offline message responses. EdHak is available from your local Atari dealer or directly from Clear Thinking for $18.95. Clear Thinking, PO Box 715, Ann Arbor, MI 48105, (313) 971-8671. Overseas orders add $3, Visa/MC accepted.

Stereo Replay

Michtron/Microdeal have released Stereo Replay for the ST, STE and TT computers. This product is the first stereo sound sampler available for the ST line. The Stereo Replay cartridge contains dual analog to digital and dual digital to analog convertors for "the ultimate in 8-bit sample quality."

The system can record in high quality stereo from its twin phono input sockets. Twin phono outputs give stereo output capability to non-STEs, and the cartridge supports the stereo outputs built into the STE, Mega/STE and TT.

The Stereo Editor allows loading of sound samples of 8, 12 or 16 bit resolution in mono or stereo. With the editor, it's possible to take 16 bit mono samples and convert them into stereo 8 bit samples, etc. Retail price is $179.95. Replay 8 is also available for $149.95 and Replay Professional for $249.95. Michtron, 3201 Drummond Plaza, Newark, DE 19711, (302) 454-7946.

Online for a Whole Lot Less?

Public Data Network (PDN) is a new nationwide online service offering message areas for all computer brands, specialty areas, online games, multi-user chat (conferences) and a whole lot more. The low $2.50 hourly rate for non-prime time (weekdays after 6 PM to 8 AM, all day weekends) makes PDN very attractive. Access to PDN is available by dialing a local phone number in nearly 3,000 US cities, and there are no surcharges.

While the "Hourly Membership" rate is $2.50 per hour, PDN also offers a "Monthly Membership" at $9.50 a month for six non-prime hours, with unused hours being credited to the following month. An "Annual Membership" for $99 gives you 12 full months of six non-prime hours each month, with unused hours credited to each following month. Additional hours used above the six per month are billed at $2.50/hour (only $2/hour for Oregon residents). PDN also offers daytime hours at only $8 per hour.

The system currently has over 47,000 public domain downloads available for the IBM, Mac, Amiga, Atari ST and Commodore 64/128. A connection to the national FIDOnet message network connects PDN to approximately 10,000 other systems. Also online are Grolier's Encyclopedia; US and World Atlases; a US History database with 1,000 photos, tables and maps; the CIA World Fact Book; Shakespeare, The Complete Works; and a library of articles from 150 leading computer publications like PC WEEK, MacUser and Digital Review.

For a limited time, PDN is offering a free online trial. Callers should set their terminal software to 8 bits, no parity, 1 stop bit and dial (503) 474-6662 to register an account. While online, callers should type IN from PDN's TOP menu to find their local access number and logon procedure. Billing can be done to Mastercard or Visa or via a CheckFREE service.

For more details or a list of access numbers, contact Public Data Network, PO Box 15, Grants Pass, OR 97526 or call (800) 788-4565. In Oregon, call (503) 474-6082.

Right on Target

David Plotkin
Contributing Editor

My friend John Jainschigg is the editor of Atari Explorer. The other day he told me about a call he received.

Seems a fellow with an Atari 600XL was having trouble saving what he'd typed on the screen. It didn't take long for John to figure out that what this guy was doing was simply powering up (bringing him automatically to the Atari BASIC screen), then typing his document.

In addition to the fact that the user couldn't save his information, he was quite annoyed by the fact that his computer repeated each line back to him with the word "Error" in front of it. Of course, John filled him in on word processors and gave him the names of some he could buy to take care of his needs.

Truly Novice

I can only postulate at how someone could end up with an Atari set-up and not a clue as to how to use it. At a guess, I would say he picked it up really cheap at some garage sale or a thrift shop—with no manuals.

Being an enterprising fellow, and having owned an Atari 2600 sometime in the past, he was able to hook it up to his television set. And there he stuck. What to do next was the mystery (but you do have to wonder how he found out about Atari Explorer).

I'd be willing to bet that there are a lot of people out there in somewhat similar predicaments. Perhaps they are able to get further than our novice friend, but at some point they get stymied trying to do something that wouldn't slow down a more experienced user.

I think we'll see more and more of this as Atari moves back into the retail channel, bundling their computers and software into attractively priced packages for the general consumer. These new users have fewer places to turn than they used to.

User Groups

The best bet for obtaining help is still Atari user groups. Atari user groups have been around for as long as there have been Atari computers. They typically meet every month, and most metropolitan areas have very active groups. Even the smaller groups are out there, supporting their members and providing answers to the knottiest questions.

I go to speak to my local user group every year, and I have noticed that it is comprised of the same group of interested faces each time I go. What is sad, of course, is that it hasn't gotten larger, but that is more a reflection of the Atari market than anything else.

The people who make up the user groups are a unique bunch. Not only are they dedicated Atari users, but they are often eager to help neophytes become experienced and get the most from their purchase.

How do you set up a word processor? What spreadsheet is best? Which printer do you like? What games are good? All these questions, and many more, can be answered at a user group meeting.

The meetings often feature product demos, speakers and, most importantly, interaction with other Atari owners. The experience can be invaluable—especially for the new enthusiast.

Probably the best way to find out about user groups in your area is to get ahold of Bob Brodie, Atari's User Group Coordinator.

Jolly Bob is a big bear of a man who has evolved from "just" User Group Coordinator to become Atari's goodwill ambassador to the world. *[Ed: Bob was recently "promoted" to Director of Communications, a job that, in my opinion, he has been successfully doing for at least a couple years now.]*

In an era that has seen almost every high ranking Atari official (except those named 'Tramiel') leave, Bob Brodie has survived. That is *real* good, because Atari needs someone like Bob.

Bob's Medicine

You see, Atari has this problem. They're not real good at public relations. My perception is that they don't like the press, either. The one time I met Leonard Tramiel, he was rude and insulting for no reason I could figure out. This is not true of Bob.

Bob treats the press—and everyone else—as his friend until you give him cause to do otherwise (which I have never done). He has become the person we have learned to count on, and he has yet to let us down. Not because he always gives us what we want (he can't do that), but because he is straight with us. He tells us everything he can, and never misleads us deliberately.

The user groups have really warmed up to Bob as well. When he shows up in town, they are likely to set up a "Bobfest"—more than a meeting, less than a show. These tend to have some local dealers and vendors showing up for a several hour gala focused on "Bob Brodie's Travelin' Medicine Show."

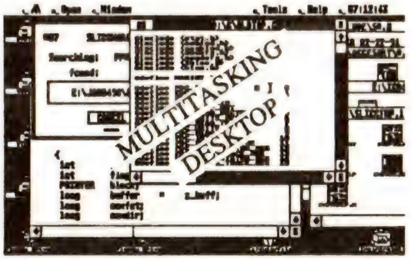
The medicine is a big dose of Atari enthusiasm, something we can all use from time to time. These "Bobfests" are fun and informative. If one comes to your area, don't miss it.

SLICCTOP

The most powerful desktop available!

And still at the unbelievable price of only . . . **$49.95**

(Requires a hard drive and at least 1 meg of memory)



ACCESS FROM GEM PROGRAMS
UNIQUE QUICK ACCESS MENU (Holds up to 144 programs / data files)
CONCURRENT PROCESSING
UNLIMITTED WINDOWS
HOT KEY CAPABILITY
CUSTOMIZED ICONS
ONLINE HELP

Summer Brings New Desktop Applications

By Randy Foster
President of SLICCWARE

SLICCWARE is pleased to announce the introduction of a series of applications written specifically for the SLICCTOP multitasking desktop. The first application, the SLICCTOP text editor will be made available to registered owners the beginning of July, 1991; and will also sell for $49.95.

August will bring the release of a powerful word processor, SLICCWORD, which will also be made available only to registered owners. Both the word processor and the text editor will run directly on the desktop and make use of the multitasking, unlimitted windows, and transparent data sharing capabilities found only in SLICCTOP !

Additionally, a terminal emulator and various five'n-dime software modules for interfacing modem hardware and performing file transfers using standard protocols, are planned to be released before summer's end.

Most importantly, SLICCTOP will not increase in price until autumn, when it will undergo a substantial increase in price to reflect its capabilities as an operating system.

Until then, it remains at an unbelievable price of only: **$49.95**

To order directly, send **$49.95** (check or money order payable to **SLICCWARE**) to:
SLICCTOP, P.O. Box 2609, Kirkland, WA 98083 Or call: **(206) 867 - 1786.**

HEY YOU, CHECK THIS OUT!

Are you searching a mountain of floppies for lost files, suffering from annoying file loading delays, making monotonous disk changes to SAVE your work, and enduring frustrating hunts for blank formatted disks? If using your floppy drive is like a bad dream, drive away the disk swapping nightmare with a hard drive from POWER COMPUTING. How did you last this long without one?

Eight Bits of Atari History, Part 1 or The Way It Might Have Been

Ed Hall (AAAUA)

One of the standard plot devices in science fiction is the parallel universe, a goofy concept involving the creation of a new world every time someone sneezes or chooses Pepsi instead of Coke. Thus, somewhere there is an Earth where dinosaurs are still running around, John F. Kennedy was not assassinated, and I am typing out this article on my trusty 8-bit Syzygy.

The soap opera world of personal computing is rich in the field of alternate universe possibilities. In this series of articles, let's look at some of them, as they relate to the Atari.

Atari Buys Apple!

In 1972, Nolan Bushnell founded Atari. The name he wanted to use was "Syzygy," but that was already claimed by a California roofing company. (*Whew!*) "Atari" was a second choice.

One day, early in 1974, a long-haired, bare-foot teenager presented himself at Atari and demanded a job. He was so determined that the company figured it was a case of hire him or call the cops.

The kid's name was Steve Jobs and, as often happened in his life, he got his own way. He became employee number 54 and worked off and on for Atari over the next two years. Though he left Atari for good in 1976 to begin a company called Apple Computer, his relationship did not end there. Whenever he needed help, whether in the form of parts, personnel or advice, he often went to Atari first.

Atari, at this time, was manufacturing arcade games and riding the crest of the phenomenal success of Pong.

Bushnell had parlayed a $500 investment in 1972 into earnings of $3 million the following year. An unconventional man, an engineer filled with the entrepreneurial spirit, he was known around Silicon Valley as King Pong. He often held brainstorming sessions in a hot tub installed in Atari's engineering building.

In those days new ideas and concepts were Bushnell's stock in trade, for within a year of Pong's release, competition had already become fierce. The videogame industry, and then the personal computer industry, were so new, so volatile, that companies balanced on a knife-edge between bankruptcy and fantastic riches.

It was an industry made for someone as mercurial and eccentric as Nolan Bushnell. In Steve Jobs, Bushnell seemed to recognize a kindred spirit. Once, when Jobs was on the verge of being fired, it was Bushnell who stepped in and rescued him. "If you don't want him," he said, "I do."

Even in a company as unconventional as Atari, Jobs stood out as an oddity. In the two-year period he worked there, he took time out for primal scream therapy and visits to a commune called the All-One Farm.

He returned from a pilgrimmage to India with his head shaved and wearing saffron robes. He became a Fruitarian, following a diet to reduce the formation of bodily mucus. It was a regime which he believed made bathing unnecessary.

Jobs's "arrogance" quickly alienated himself from his co-workers at Atari, and to keep the peace, he was re-assigned to work at night. Sometimes he'd bring along his buddy, Steve Wozniak, who played games for free on the assembly line.

One day Bushnell came up with a new idea for a game and challenged Jobs to build it. For the next few nights, when Woz showed up to play games, Jobs got Woz to work on the design while Jobs did the wire-wrapping. The game, called "Breakout," was a logical exension of Pong, and became an enduring classic whose most recent incarnation is "Arkanoid."

Bushnell offered Woz a job, but Woz was already happily employed at Hewlett-Packard. Like Jobs, he was a college drop-out and electronics junkie, but his real love was computers.

This interest became supercharged in January 1975 when the first personal computer, the Altair, became available. This was a kit needing hours of careful soldering to assemble. It came with less than 1K of memory, information had to be entered using a row of toggle switches, and its display consisted of a row of flashing lights.

Yet, within a month, the tiny company selling the kits was deluged with 4000 orders!

Woz began building a computer of his own design, using parts scavenged from Atari and Hewlett-Packard. Though he was doing it for fun, Jobs thought it might have commercial possibilities. Others were skeptical because Woz had decided to go with a brand-new microprocessor, the 6502, since it was significantly cheaper than the Intel 8080, which was used in the Altair and other early machines.

In fact, it turned out to be one of many inspired choices made by the two Steves. The 6502 family of chips became a stalwart of the personal computer industry, showing up not only in the Apple II, but also Commodore's VIC-20 and 64, and Atari's own 800/XL/XE line.

Undetered by naysayers, Jobs convinced Woz to form a company which would produce and sell the boards Woz designed. The name they decided upon—Apple Computer, Inc.—reflected Jobs's Fruitarian leanings. It also put them ahead of Atari in the phone book.

It wasn't the first time the two had joined together in a business venture. Back in 1972, when Jobs was still in high school, they had built and hawked another Woz design—blue boxes, devices used to trick the phone company into allowing free long-distance calls. This time, the business was legitimate, though still a sideline. Neither of them planned on giving up their daytime employment at Atari and Hewlett-Packard.

Jobs immediately began recruiting people from Atari to help bring out the new computer. Ron Wayne became the third partner in Apple Computer, Inc.; he designed the first company logo and worked on the technical manual. Howard Cantin (who had laid out the original Pong board) did the schematics. Later, another recruit was Rod Holt, who left Atari and became a key Apple engineer.

Working out of the Jobs's family garage, the tiny company produced a small quantity of Apple Is. By today's standards, it wasn't much of a computer. It had no case, keyboard or power supply. It was simply a circuit board whose display output was limited to black-and-white. Jobs and Woz hoped to make a modest profit and were astounded when they received a $25,000 order. Jobs scrambled to raise enough credit to fill the order.

It was a heady, exciting, nerve-wracking time. Jobs threw all his energy into the company while Woz was busy making improvements to his original design. Topping the list was the capability to display in color, so Woz could play Breakout on his own computer. By the fall of 1976, Woz had a prototype of the Apple II ready for the first-ever personal computer festival.

But, bringing out the Apple II involved a significant escalation of risk. First off, it was going to be a complete unit (case, keyboard, power supply) which meant a significantly higher production cost.

Secondly, new companies and new computers were popping up as people scented the money that could be

FREE Installation video w purchase of ram board w chips!

Howdy Partner!

ST/IME

Lithium 10 year battery backed-up clock and calendar module that fits in all the ST's. Install it under all the St's. Install it under one TOS ROM chip and all your files will be date and time stamped correctly. Comes with digital corner clock display. Frees up your cartridge port. Stop wasting time setting time! 3yr.warranty **NOW STe COMPATIBLE!**

~~$59.95~~ $49.95

Z-SIMMS STe SIMMs

NOW expand your new STe with Z-SIMMS, the STe 1 Megabyte SIMM module that expands an STe to 2 or 4 Megabytes. 1yr. warranty. Highest quality and with STe installation instructions.

~~$79.95~~ $54.95

Z-KEYS

✓ IBM-PC/XT keyboard interface to the 520STFM/1040ST
✓ Solderless internal interface that is easy to intstall.
✓ Complete manual and disk included.
✓ WORKS WITH PC/XT KEYBOARDS. $79.95

With Keyboard: $129.90

Z-RAM/2.5 MEG

Ultra low-profile solderless 520ST/520STfm/1040ST 2.5 Meg memory upgrade. Fits under all RF-Shields, including the older 520ST's with external disk-drives. Plug & Play! Comes with 1 yr. warranty, detailed manual, RAMdisk software and diagnostics on disk.

$99.95 ~~$129.95~~ w/o RAM
$229.95 ~~$279.95~~ with RAM chips

Z RAM/Mega 2-to-4

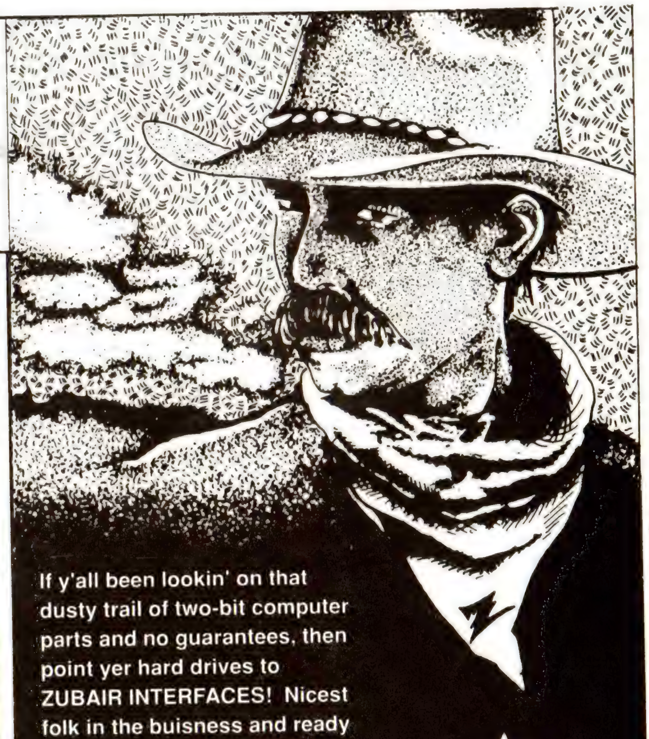
Solderless Mega2 Ram upgrade to 4 Meg. Plugs into the Mega2 and will not interfere with internal hard-drives. The easiest way to upgrade your Mega2 without soldering! Comes with complete instructions and diagnostics disk.

$99.95 ~~$129.95~~ w/o RAM
$229.95 ~~$279.95~~ with RAM chips

Z-RAM 3-D/4 MEG

Innovative 3-D double decker boards fit into the video-shifter metal box of the ST. Memory diagnostics and RAM disk software included. 1yr. warranty and 30-day money-back guarantee. Super reliable data and ground connections make this *the* upgrade board for your ST.

0K (no chips) ~~$149.00~~ $109.95
2.5 Meg ~~$299.95~~ $249.95
4 MEG ~~$479.95~~ $379.95



If y'all been lookin' on that dusty trail of two-bit computer parts and no guarantees, then point yer hard drives to ZUBAIR INTERFACES! Nicest folk in the buisness and ready to supply your memory upgrades faster than a willow tailed coyote runnin' from some hot July sunshine! Call everyone. Then call us last for the best price!

made. Most of the early companies offering personal computers had hobbyist origins. Woz and Jobs began nervously looking over their shoulders, anticipating the arrival of established companies like Tandy and Texas Instruments, with whom they felt it would be impossible to compete against.

All three Apple partners felt the pressure. Ron Wayne got cold feet and backed out of the company. Woz offered his new machine, the Apple II, to Hewlett-Packard, but his employers politely declined. Even Jobs was ready to sell. He offered the Apple II to Commodore, but they thought the price was too steep. He also offered it to Atari, but made the mistake of putting his bare feet on the desk of company president, Joe Keenan, and was immediately ordered out of the office.

At the time Atari was stretched too thin to get into computers, anyway. The VCS game system was under development and the company desperately needed capital. It was for this reason that Nolan Bushnell sold controlling interest to Warner Communications.

Bushnell did, however, give Jobs a tip that eventually brought Mike Markkula and Mike Scott to Apple Computer. Together, the two Mikes supplied something the two Steves did not have—experience in running a company—and it was the final component necessary to make Apple Computer a success.

The Start of the Game

The Apple II was introduced in 1977 (the same year as the Commodore PET and the Radio Shack TRS-80 Model I) and became an instant success. By 1980, Apple was the industry leader with sales of $117 million, over 1000 employees, and several new computers under development. When Apple finally went public that year, its market value became greater than that of Ford Motor Company, and Steve Jobs was suddenly worth $264 million.

As important as 1980 was in the fairy-tale story of Apple, the previous year was perhaps even more significant. In 1979, Steve Jobs swung a deal with Xerox which gained him admittance to the Palo Alto Research Centre (PARC), a sort of ivory tower of the computer world, into which Xerox had pumped $100 million towards long-term research.

There, Jobs and others from Apple discovered Smalltalk, a visually-oriented programming language designed by computer visionary Alan Kay. Smalltalk used windows, icons, pull-down menus and a mouse. Jobs was so impressed he incorporated all of these features into the Lisa and the Macintosh, both of which were already under development at Apple.

Though Xerox used similar features in its own computer, the Star, it was not a success when it debuted in 1981. It took the Mac, which came out three years later, to popularize these features. Eventually, a graphics-based operating system using the desktop metaphor would be imitated not only by Atari and Commodore, but also by IBM.

The Macintosh

The Macintosh became a personal crusade for Jobs, and opened a deep rift in the company. He drove the Mac team extraordinarily hard and demanded total commitment from them. He wanted people still imbued with the hacker spirit, people willing to go the limit to produce an "insanely great" product, a computer which would "make a dent in the universe."

He didn't want the bureaucrats and traditional engineers who had fouled up the Apple III and the Lisa. He wanted renegades, people who got things right through sheer brilliance, not by endless meetings and committee-work.

Consequently (to screen out people with the "wrong stuff") job interviews were rather strange. "How many times have you dropped acid?" and "When did you lose your viriginity?" were two standard questions. The final test involved playing a game of Defender with Burrell Smith, a self-taught engineer who was designing the main circuit board for the Macintosh. If you didn't play a hot game of Defender, you weren't likely to fit in.

Jobs was still visiting Atari in the early 1980s, even though Nolan Bushnell was no longer around. Every few months, Jobs would show up to have lunch with Alan Kay in Atari's executive dining room. Kay had finally tired of PARC and joined Atari as its chief scientist. There he was urged to build "fantasy amplifiers." One of the projects he was working on was an "interactive movie game"; another was an encyclopedia in a Smalltalk-type environment.

Finally, in 1984, with Atari on the skids, Jobs finally convinced Kay to join Apple. Kay immediately earned Jobs's displeasure by writing a memo which compared the Macintosh to a Honda with a one-quart gas tank.

The following year was Jobs's last at Apple. The disappointing sales of the Macintosh threw the company into upheaval, and Jobs was finally ousted by another man he had hired, the man from Pepsi, John Sculley.

One can't help wondering how good a game of Defender John Sculley plays.

ESG has the largest collection of
IMG clip-art for the Atari ST, and is
now introducing a new line of vector clip-art.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$ 39⁹⁵

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$14⁵⁰ ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$25⁰⁰

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$14⁹⁵

800 5 PIECE BOARD SET

Includes Main Board, Power Board CPU, 10K O.S. and 16K RAM Board. All boards new, tested and fully populated. Set includes instructions that will allow you to repair ANY 800 Computer $28.50

800/400 MODULES

New Parts Complete with IC's

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

Multi-Tasking for the ST!!!
(well, almost)

Bruce Urbanski (WAUG)

Yes, here it is...first in Germany and now in the States...MultiGEM for the Atari ST! Is it really multi-tasking? The problem becomes "How do you define multi-tasking?"

I would define it as running two or more different tasks (programs), in such a way that, to the user, it would look like the two functions were being performed at the same time. For example, being online on your favorite online service *and* being able to play your favorite game of cards against your favorite computer.

The Apple Macintosh computers come very close to this with something called MultiFinder, which is more like multi-sharing than multi-tasking. (Only with the release of System 7 has the Macintosh gained true multi-tasking.) MultiGEM does for the ST what MultiFinder does for the Mac.

The Dog's Tail

Look at it this way...either it's the dog who wags the tail or the tail that wags the dog. In the dog wagging the tail scenario, the multi-tasking manager tells each program when to stop and when to run. The manager has complete control over what is going on. In the reverse situation (tail wagging the dog), programs tell the manager when they will stop and start. (I have worked for places like this!)

In the first scenerio, the end result would be, say, three seconds of being online and three seconds of card playing...another three seconds devoted to online time followed by three more seconds of card playing...etc. (This may be an exaggeration, but you get the point. Don't you???)

In the second scenario, the card game deals the cards, but you cannot go back online until the game is done dealing...

Such is life with MultiGEM and MultiFinder. With both programs, you load programs you want to use into memory and you are then able to switch back to the Desktop or to another program as you wish. On the Mac, you click on icons in the upper right corner of the screen; with MultiGEM, you use the desk accessory slots. But, I am getting ahead of myself, so I'll start at the beginning...

First there was light, then a big bang, then the WAUG AtariFest in Windsor, Ontario (that is in Canada, eh?). One of the booths there was Rimik Enterprises. They had a light gun hooked up to an STE, so I went to take a few shots.

While there, I saw the flyer for MultiGEM. I spoke to Rich Betson for awhile about MultiGEM and left my deposit for the wonder product. Shipping was expected in two to three weeks.

After three weeks, I did not get my program, but I got a letter instead. The letter said something to the effect of "Sorry, it'll be a couple more weeks." Sigh. Thoughts of vaporware ran through my head, but I was impressed that they did send me a letter.

Three weeks later, still no program! Then the phone rang... (ring, ring) "Sir, we will be shipping your order out tomorrow!" Anyone who calls me "Sir" is OK in my book! Yes, they called me unprovoked—and I've been called *a lot* of things, but never unprovoked (grin). What service, and with the 4th of July weekend coming up, too! Ooohhh, lots of free time I would have to eat, drink and play with my new toy.

It's in the Mail

Well, you guessed it. It didn't show up until two weeks later. I was beginning to think my mail carrier was a Commie IBM user who would not deliver Atari software. Seems it was not her fault; the package was mailed a week late. Oh well, it was mine now. *On to the basement computer room!!*

File Heaven

MultiGEM comes in a plain white cardboard box with a front and back cover sheet pasted on it—no frills here. Inside, there was a disk and a small, 20-page manual. Well, good things come in small packages.

Getting Started

Installation was fast and simple...insert the disk into the floppy drive and click on the Install program, follow a couple of prompts and you're off. As told to you in the manual, you should make a backup of your DESKTOP.INF (or NEWDESK.INF for Mega/STE and TT users) file. MultiGEM will rewrite and modify this file in order for it to install all its options. The only bad part here is that if you have an extensive Desktop setup, you have to rebuild and resave it, or directly modify your INF file with a text editor. That is the only drawback to the installation.

I guess this would be a good time to mention system requirements. MultiGEM will run from floppy (or hard drive) on any ST/STE/TT with TOS 1.2 (Mega TOS) or greater. Also, at least one meg of memory is pretty much a necessity. I would recommend a hard drive and two meg minimum if you want to use this software to its full potential.

On to customizing your system...MultiGEM is intelligent enough to look at your system (RAM, TOS version, drive types) and install itself accordingly.

Then, you must make a few decisions. MultiGEM takes up all unused accessory slots. Any ACC files found on your boot partition will take priority over MultiGEM. If you have no accessories, then all six slots will say "MultiGEM Slot." You could then load up to six programs into memory and switch between them.

You can use any combination of empty slots and ACC files you wish. This is the first decision you need to make—what you want installed as accessories. I like to use my UIS all the time, so I leave that in the root with the .ACC extender. All the other accessories, I've renamed to .MUC.

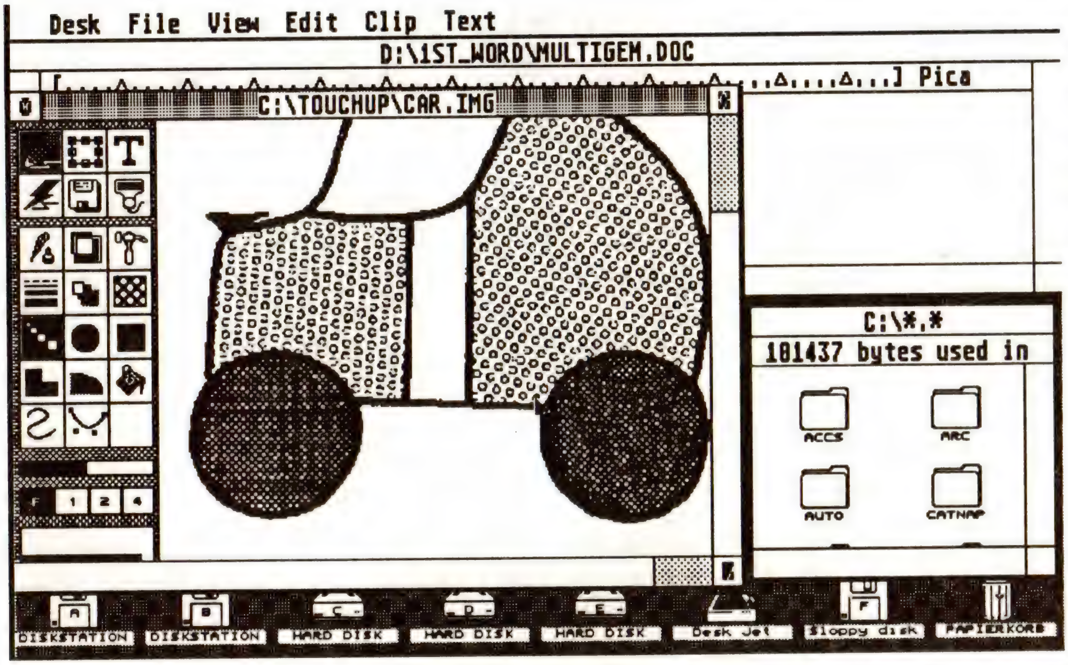
MUC? No, not the stuff made with dirt and water...and it's not a reference to Curly from the 3 Stooges (MUC MUC MUC). MultiGEM has a clever way to keep desk accessory users happy. MultiGEM will run any accessory as a program, providing it has a .MUC extension. You can put all your accessories into a folder and run them at will. Very nice feature. If you directly modify the DESKTOP.INF file, you can change the default .MUC extension to any three letters you want (like ACX). This is explained in the manual.

Finishing the Configuration

Now, there's one more step to do in the configuration process—setting preferences for programs you plan to use with MultiGEM. The configuration dialog is a neat feature and one that solves a number of "problems" that could occur with some programs.

For instance, what do you do when you want to multi-task a program like Flash? If you did not know it, Flash loads itself into memory and then uses all remaining memory for its capture buffer. Oops, no more room to load other programs.

The solution here is simple—MultiGEM allows you



to limit the amount of memory a program can have. You use the File Selector to "insert" a program into the list of programs known to MultiGEM. Then, you set a parameter to have MultiGEM tell the program how much memory it can access. I use the default of one meg for Flash, but it is configurable from the minimum RAM required by the program to the amount of free RAM left in the system.

So, say you give Flash one meg...TouchUp, two megs...let's see, how about 1ST Word, 500K. On a four meg machine, you could load all these programs and still have 500K free for workspace and miscellaneous programs.

To make things a little more complicated, you can run other programs from within Flash. How will MultiGEM handle this? Here, you have yet another choice. MultiGEM can unload Flash and load, say, XYZ.TTP into Flash's vacated memory or XYZ.TTP can be run in the free RAM you still have left in the system. It's your choice, and MultiGEM allows you to define which way you want to do it. Either way, when you are done with XYZ.TTP, Flash returns to memory right where you left off. *Yes, it does work Ma!!!*

So far so good, right? Well, OK, there are a few drawbacks. But before we get to those, you should first understand a little of what MultiGEM is doing. Not being able to rewrite TOS/GEM (as I am sure a lot of people would like to do), the MultiGEM programmer (Pascal Merle) had to work with TOS/GEM. MultiGEM had to be able to get its hooks somewhere into the OS to be able to do what it does.

In GEM there is a series of AES routines that start with "event_" (such as event_multi, event_button, etc.). These system calls keep track of mouse positions, window resizings, etc. This is how MultiGEM does its dirty work—it uses these event_xxxxx calls to allow switching between programs.

The only problem with this is that programs that do not use a window seem to have more problems with MultiGEM than programs that do "do windows." Any program that is window-based, like PageStream, works perfectly with MultiGEM.

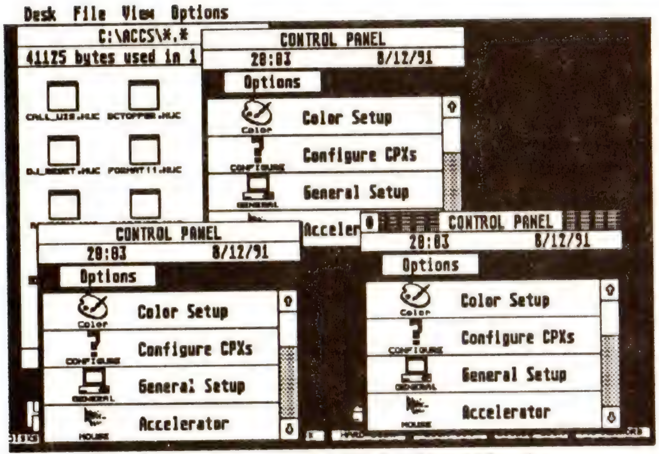
Programs that don't use resizable windows but give access to drop down menus and accessories will also "multi-task" with MultiGEM. You can drop into and out of other programs that are already loaded into a MultiGEM slot. But, once you've run a non-windowing program, you often can't directly access the Desktop to run more programs.

If a program does not have its own window or allows access to desk accessories, the program still runs, but it does not multi-task as you would like. ARCShell is good example of this—it's comprised of a dialog box that does not allow you to do anything outside of its screen. So, you can't use ARCShell to start unARCing files and then switch to another program while the files are unARCed.

I mentioned drop down menus a little earlier. Using the desk accessory drop down menu is one way of switching from place to place. When you run a program, the name of the program is placed into one of the MultiGEM slots. While in a program, clicking on an unused MultiGEM slot puts you back at the Desktop—while the program you just left is still running and chugging away. You can then run another program, thus filling another slot.

For example, you can run TouchUp, then go back to the Desktop and run 1ST Word. Using the Desk drop down menu, you can jump between applications at will. Or, you can jump to the Desktop for a quick format of a disk. But, doing a format from the Desktop suspends all multi-tasking operations...including printing. A printer buffer is highly recommended for use with MultiGEM, if you have the memory.

What about TOS and TTP programs? Well, sit right down there partner and let me tell ya 'bout 'em. Clicking on a TOS or TTP program will cause the ST to run a MultiWindow program. This program opens a GEM window and then attempts to run the TOS or TTP program inside of it. This works fine for many of these programs, like ARC.TTP. Viewing text files is also handled in this manner, via a special program supplied with MultiGEM.



How MultiGEM Doesn't Quite Work

Say, for instance, you double-click ARC.TTP. Instead of the standard argument window, you get a full-blown GEM window which can be resized to your liking, with ARC.TTP waiting for the rest of the commands. You type in the commands, press return and off it goes.

Now for the problem, for which I am not sure what the cure is—when ARC.TTP is running (or, for that matter, XYZ.TTP) it is hard to get back to the Desktop, or anywhere else for that matter. I think it might be because these programs do not make event.xxxxx calls very often while processing, or maybe these programs are just so CPU intensive that there is not enough speed in the system to get back to another application.

I have tried switching with both ARC.TTP and XYZ.TTP. The Desktop tries to come up, but the system may draw only one or two windows during the entire process. Would a 68030 board cure this...or a TT? If anyone has access to one of these and uses MultiGEM, I would like to hear what the result is. Anyway, the result is the tail wagging the dog. (I ran this at 16 MHz on a Mega/ STE, just in case you were wondering.)

Some TOS and TTP programs don't seem to want to stay confined to a window. These pesky programs expand to fill the whole screen, so you lose any ability to switch to other programs.

How I Was Hooked

The reason I was so enticed by this product was that I wanted to do Zmodem file transfers and/or ARCing in the background...as of yet, they don't work together.

I can't start a Zmodem download and switch to my word processor, for instance. Maybe I'll blow the dust off my Shadow disk to see what it will do...but it did background Ymodem downloads without MultiGEM.

Flash acts kind of funny now and then when using MultiGEM—over-lapping windows or a Desktop that scrolls off the screen when going back online.

These are mainly screen redraw problems. I even tried to rename Flash to FLASH .TTP to get it to stay inside a window. No go. I guess computers are smarter than I am.

As for programs like TouchUp, 1ST Word and any non-intensive or fully GEM-based program, MultiGEM works like a charm. Can you run a BBS and play Dungeon Master at the same time? I think not.

Well I have blabbed long enough. In a nutshell, does MultiGEM work? Yea, it does!! Does it multi-task everything?? No, it doesn't. Hopefully, this is just a first step in multi-tasking. I would expect a few more things to change—like the ability to somehow force programs into the "background" via a key combination. Also, I expect some programs will be written to take advantage of MultiGEM.

I have tested MultiGEM on a couple of different machines and demonstrated the program to a few people. All are impressed, but not all of them have a use for MultiGEM. Look at this one before you buy; MultiGEM is well worth the money, but it may not be for everyone.

Here is a list of programs that have been tried with MultiGEM. If you can get one of the programs listed below as not working to work, please let someone at AIM know...and possibly how you were able to get it to work. —Bruce Urbanski and Bill Rayl

Program	Results	Comments
1ST Word	yes	
C-Breeze	yes	
Calamus	yes	
Chronos-3D	yes	Can't access directory windows if they fall under the main Chronos screen.
DCTopper	yes	Works but might drive you crazy!
DCXtract	yes	Quirky redraws.
DEGAS Elite	yes/no	You can only switch to other programs if they've already been "loaded" into other MultiGEM slots. Doesn't allow you to get to directory windows by clicking an unused MultiGEM slot.
EdHak	yes	Works perfectly as an ACC or PRG.
Flash!	yes	Redraw problems. In Terminal mode, you can access desktop by clicking the left mouse button, although the mouse pointer can't be seen.
Hotwire 3.0	yes	Directory windows from the desktop refuse to go away and must be closed or moved around.
JoppaFAX	yes	
LDW Power	yes	
LookIt!	yes	Can't access other programs while actually viewing a file.
Michtron's Toolkit	yes	Quirky redraw of drive icons.
NeoDesk 3	nope	Just bombs...
PageStream	yes	
ST Writer Elite	yes/no	Same as DEGAS Elite.
Superbase Pro	yes	
TouchUp	yes	
Tracker/ST	yes/no	Same as DEGAS Elite.
UIS 3.3	yes

Sex, Lies and Graphics/Video

(but without any sex or many lies)

Jay Craswell
Contributing Editor

This is a story that has been dying to be written, but no one seemed to want to do it. So, I will take wordprocessor in hand and attempt to tell the story of graphics and video life in general.

First, a disclaimer—I am president of a company that manufactures graphics cards for the Atari. And I am also a former designer (or co-designer) of two other companies' graphics products for the Atari. Most importantly, my opinions are *undiluted* and may cause some people to react adversely.

Reader beware!

Resolution and DPI

A lot of hands are wrung and tears shed trying to explain these terms that get thrown about so often. And here is an area that really has a lack of understanding.

Resolution is the pixel count—horizontal and then vertical. Most monitor screens lay flat, with the horizontal dimension being larger than the vertical. If this is swapped, however, we generally refer to this as a page-oriented or portrait monitor. The reason? Laid on edge with the smaller dimension across sideways, many "tubes" are roughly proportional to a single sheet of paper. Sometimes these are called single-page monitors. Your typical monitor, however, is not laid on edge this way and is call a landscape or dual-page monitor.

Since we touched on proportions, it's time to talk ratio. If you measure the visible dimensions of a particular monitor tube—horizontal vs vertical—you will get a ratio of 4:3. OK, it's true that there are 1:1 tubes from NEC but, for the most part, the ratios are 4:3.

Now then, if your graphics card displays 640x480, you have a perfect ratio (or unity). Graphics cards that output 320x200, 800x600, 1024x768, 1280x960, or 1600x1280 are all unity (or close enough).

This is a very desirable feature. When the screen is in unity, circles and boxes may be drawn with the knowledge that each pixel is square. A simple square, for example, will have the same number of vertical and horizontal dots. If the display was not in a unity ratio, you would need a program to calculate the number of extra pixels (or dots) to make up the difference. Under such circumstances, the display is slowed in two ways—the calculation and the drawing of extra dots.

Also, a non-unity ratio screen effectively cuts the resolution. Say, for example, we are drawing to a 640x200 screen. Two horizontal dots are needed for each vertical dot to make a "square" pixel. Worse yet, even though we can get a slight improvement on the resolution in one axis, we are, in effect, drawing a 320x200 screen for most practical purposes. We waste every other horizontal pixel to "square" the dots. Worst of all, we have to write them in the first place, thus slowing down the system.

DPI is really very simple to understand. Take a ruler and measure how many viewable inches your screen has horizontally and vertically. Now, divide the number of pixels in each direction and you have D.ots P.er I.nch figured out!

If your tube has unity ratio, your vertical DPI and horizontal DPI should be the same (or very close). Remember, though, that changing the width or height of the screen display will change this value.

It's very important to understand that this DPI value changes when you plug your graphics card into a different sized monitor. A 1024x768 card plugged into a 19-inch monitor will have around 70 DPI. Plug the same card into a 16-inch monitor and the DPI jumps to 90. Plug into a little 13-inch Sony and it may well be over 110 DPI.

Assuming that a font will continue to have the same numbers of pixels (a font that won't change its spots), you might ask what changing the DPI will do to the appearance of the text. Let's say the font looks "just right" on a 9-inch screen. And let's say that it's 75 DPI. When we put it on a 13-inch screen, the font will look larger (the screen's DPI will be lower, however).

Plug your video cable into a 19- or 21-inch screen and your text will be very large indeed. Remember that plugging you cable into a larger and larger monitor will lower the DPI. The fonts, however, can be considered to have been created for a specific DPI.

This may be a little confusing, but try to follow it. When the screen's DPI and the font's DPI are the same, you will have text display that is 1:1 with the real world. So, if we are viewing 75 DPI fonts on a display that has 75 DPI resolution, the text should (we hope and pray) print out the same size as what we see on the screen.

What the Macintosh folk have done is set 72 DPI as the official screen standard. No exceptions to the rule. If you want to make a screen font, you had better get it close to 72 DPI so the marketing geniuses can chant "WYSIWYG."

Standards are good when developing new technology so the rules are understood and progress can be made. Right now, I see this "locking" of screen DPI as a possible hinderance. Printers (worth their salt) are at least 300 DPI. And "real" printers are 1200 or 2500 DPI. The reason Apple didn't make the screen DPI 300 was that it just wasn't possible given the technology. (Monitors running fast enough to do 300 DPI are still laboratory curiosities.)

Hundreds of software titles

New summer hours: M-F 10a.m.-7p.m., Sat 12p.m.-6p.m.

Authorized ATARI COMPUTER Dealer and Service Center

However, 72 DPI fonts tend to look jaggy as hell. Besides, with cards like the AlberTT, ISAC and the Viking Moniterm, we "might" like a chance to plug in a new value for the software DPI to get a nicer looking display.

Colors

There is a lot of talk about added colors on the ST. As you can imagine, more than once my phone has rung with questions about the total number of colors displayable on the ISAC and ALBERT cards. More than once I've talked to people who want more colors and want to know WHY WHy Why why I would be so stupid as to not support these products with 16 million colors.

First, you have to have a use for colors. If you need 16 million colors for a spreadsheet I suggest you seek professional help. Having "some" color for pie charts and the like is great—but, really. Believe me, 16 colors is enough.

Depending on what kind of CAD work you do, black and white can be OK for some things, but colors are very useful if you can get them. There is a level, though, where added colors are overkill. This limit, believe it or not, is 16 colors.

Here's why. First off, using many different shades is fine for a paint program. But face it, CAD systems are just not used for flesh tones! Get my drift? If you're doing any pen plotting in your CAD work, be aware that all but the most expensive pen plotters have only 8 pens or even less!

In electronic CAD, you will have layers. Red on one layer maybe, blue on another, and so forth. With more than 16 layers of anything useful, you will see zilch. A big white blob is what you get with many overlapped layers.

Also, in CAD work, it's very important to be able to recognize the different colors. Red versus bright red is OK, but if you start getting into several shades of teal...forget it!

In publishing we have survived for quite a while with black and white. However, pictures are starting to be scanned in that are in gray scales. For acceptable pictures you would expect 16 shades of gray. Adding more only improves the quality marginally. If you are talking about color DTP, you can get some things printed in color "fairly" cheaply as long as the number of colors is not too large.

Now I admit that video-type operations can benefit greatly from having 16 million colors. However, video is, by nature of the TV signal specs, a dinky 524x524 picture. This would be totally unacceptable to CAD and publishing people. Building electronics to satisfy both videophiles and CAD/DTPers might be possible (though expensive as hell), but you would need two monitors.

Painting software could also "benefit" from added colors. But how would you print the pictures? With 16 colors, you can pen plot it or maybe use a Desk Jet. When you are talking about 16 million colors, you are talking about color pre-press. You don't even want to know how much that would cost.

Speed

Also on the list is speed. At 1024x768, you are moving x times the video memory versus the standard ST. And because the screen is refreshed many times faster (and some other reasons), reading and writing to the higher resolution screen is not as fast as it is to the ST screen.

Go to 16 million colors and you are making the system six times *slower!* Just think, Jim Allen's speed-up card gives you (at most) 200% speed up. Now, do you really want to slow the system down 6 times? No, of course not.

This is not to say that some companies aren't doing their best by coming out with some in-between standards—an 800x600 256-color card for example. The problem here is that the number of colors does not conform to any previous Atari standard. What you lose here is compatibility. Existing software doesn't work, and that means all you have an expensive color demo.

Conclusions

That is not to say that ISAC, ALBERT and even my old Viking from Moniterm didn't have troubles. But these were more on the line of programs that spasm when offered the possibility to run in higher resolutions. These kinds of problems were fixed many times by some truly trivial bug fixes. One or two instructions, that sort of thing.

No, I stand by my "stupid" choice. And I think that once it's understood, people will see the reasoning. Of course, for those of you that understand and *still* want a 24-bit card for video work...OK, OK! The project's code name is Leonardo. I'll tell you more about it when it's in production.

***STalker 3* is the best, most complete, easy to use, telecommunications software for your Atari!**

Features Include:

- Runs in a GEM window as a GEM program or desk accessory with full background operation!
- VT52, VT100, PC-ANSI terminal emulation
- ASCII, XModem, XModem 1K, YModem, YModem/G, and ZModem file transfers
- Virtual screen size (from 40x24 to 200x2000)
- GDOS support for different terminal fonts
- Powerful Autodialer with up to 30 numbers
- 20 user-definable function keys
- Cut and Paste text clipboard
- Support for the *NeoDesk*™ *3* desktop
- Fully integrated with the optional *STeno*™ text editor
- Advanced *BackTALK*™ scripting language
- 200+ page manual, including full tutorials
- All of this and more for only $49.95!! (suggested retail)

Games

#596 - Quick Draw V1.0 - Pictionary drawing game
ST Reverse V1.0 - Othello type game (Color)
#769 - Super Breakout (Mono Only)
#957 - Mystic Mirror: Adv. Game Similar to Dungeon Master. 2 Players (Color)
#960 - Wheel of Fortune V3.0 (Color)
Stellar Starfighter - Shoot'em Up
#962 - Space War V1.0 - The Classic Space Shoot'em Up for 2 Players (Color Only)
#963 - Go Up V1.0: Lode Runner Clone w/Editor (Mono Only)
#980 - **Tetriside** - Tetris type game for 1 or 2 players (Color)
Valgus Squared - Sequel to a Tetris clone. Now those seven familiar pieces come at you from all four sides of the 27 x 27 area. (Clr)
#993 - *Monochrome Games*
Man Pac - Pac Man Clone
Columns - Tetris Clone
#1040 - **Sorry V1.8** - Just like the board game. For 2-4 players. (Color Only)
Valgus V2.0 - Tetris clone for 1 or 2 players simultaneously. (Color Only)
#1079 - Xenomorph Maps.
#1175 - MidiMaze II (DBL)
#1180 - Hac Man 2 - Professional quality Pac Man Clone. (Color/1 Meg RAM/DBL)
#1202 - Hero *Vapid's Keep* Demo (Color Only)
#1222 - MORIA - Single player dungeon simulation (1 Meg RAM/DBL)

For Dungeon Master

#511 - Maps for Levels 1-7
#512 - Explicit Hints and Character Set on the leve above Chaos with the best equipment selection.
#590 - Game Disk Organizer
Saved game file of characters with a Firestaff weapon.
#720 - Maps for Levels 8-14

For Chaos Strikes Back

#898 - Maps for Levels 1-10
#899 - Walk thru of opening level. Dragon Lair portraits. 5 Fantasy and 3 Sci Fi character portraits. Prison List. Spells and Potions List and more!
#997/998 - Maps for Levels 5 & 3
#1015 - *Cartographer Demo*
Maps out or Edit your Dungeon Master or Chaos Strikes Back Saved Games. Demo fully functional on levels 1 & 2. (1 Meg RAM)

Utilities

#399 - Degas/Degas Elite Printer Drivers
#400/800 - 3 1/2" Disk Labeling Programs
#438 - Vanterm V3.0 - Shareware Terminal
#443 - Intersect RAM Baby, Amortization
#514 - Monochrome Emulator V3.0 - Run Mono programs on Color monitors
#688/866 - H.P. Deskjet/Laserjet Utilities
#768/938/1165 - NeoDesk Icons
#801 - *Label Printing Programs*
Cassette Label Maker, Label and Envelope Printer and more.
#888 - *Atari ST Subjects* (Book) Programs
#938 - NeoDesk Icons, Recoverable Trashcan V1.2
Quick NeoDesk INF Loader, NeoDesk Canvas
#940/941 - **LaserBrain V1.31** - Epson Emulator for Atari SLM804 Laser Printer. (Mono Only/DBL)
Additional Fonts on #1001-1003
#950 - **24 Pin Printer Emulator** - Written for printers without a letter quality mode.
Deskjet Disk Labeling Program
Menu Master - Set up menus to auto load programs on your own disks.
#951 - DC Show It V1.1, Head Start V1.1, Little Green Item Selector V1.6C
#952 - Address Labeler V2.0 - Create, Print and Store address labels
#988 - Fast Copy III, NX-1000 Set Up
H.P. Deskjet Print Utility V1.4
#991 - Label Printing for H.P. Deskjet & Avery 5260 Labels, Desktop Formatter, Disk Sector Edit.
#1008 - **ICONDESK** - Set up different looking icons for different file types. 79 icons & editor included. (Mono required to use editor)
#1009 - Diamond Back II w/Cache Demo
#1038/1039 - DC Desktop Icons
#1041 - ST Data Handler V3.0 - Simple, mouse driven data base program.
Pack V2.0 - Reduces file size of programs while still allowing them to be executable.
#1130 - Double Click Utilities - Disk full of handy utilities from Double Click Utilities.
#1174 - Address/Labeling Programs

Applications

#810/811 - SHEET V2.5P - Shareware Spreadsheet.
#965 - Checkbook V1.09, Almanac (Color)
#989 - Paperless Accountant
#999 - **ST Writer V3.8** - Simple easy to use word processor with extensive documentation on disk. H.P. DeskJet Driver included.
Spell V2.8 - Spelling Checker (No words)
#1026 - B/STAT V2.36 - Powerful graphics and statistics program. (DBL)
#1063 - **Address Database V1.45**
A dedicated address book (Color)
#1131 - Deluxe Paint Demo
#1133 - Gramslam Grammer Checker V2.3

Children's Programs

All Children's Programs Require a Color Monitor

#551 - *Kid Shapes*
Graphics design program patterned after a magnetic set. For ages 2-8
#552 - *Kid Shapes Plus*
As above, but for older children. Larger number of choices for more complex pictures. For ages 8 & up.
#667 - *Benjamin's ABC's*
Teaches young children the letters of the alphabet with digitized speech. (DBL)
#699 - *Kid Adder* - Uses pictures to teach addition
Kid Color - Learning game for 3-7 year olds Uses the mouse to point to boxes with a certain color.
Kid Story V1.4 - A silly version of the Little Red Riding Hood. Allows children to create a story.
#920 - Simply Math, Picture Puzzler
#982 - Body Shop: Human Anatomy Tutor

PrintMaster Utilities/Graphics

#393/394/533/773/774 - Additional Graphics for use with PrintMaster Plus (5 Disks in all)
#799 - ***PrintMaster Utilities***
PrintMaster to Degas, View/Transfer graphics, Print graphics on Epson/compat.
#1169 - ***PrintMaster Utilities***

CURSE of the AZURE BONDS

Dick Laudenbach
(MAST)

This fantasy role-playing game from SSI is based on the TSR novel of the same name. In the novel, set in TSR's Forgotten Realms, a female sell-sword named Alias awakens in an inn in the town of Suzail. She doesn't remember how she got there or where she got the series of five twisting, magical, blue sigils on her arm. She soon learns that these symbols flare up from time to time causing her act against her own will.

With the help of her friends—Olive Ruskettle (a halfling bard/thief), Akabar (a southern mage) and Dragonbait (a lizard-man paladin)—Alias learns the purpose of her symbols. She then tracks down the five evil factions controlling her through the sigils and destroys them with the help of her friends.

In the computer game, your party of six adventurers wake up in the town of Tilverton with five similar sigils on your arms. The object of the game is to track down the people responsible for the symbols and destroy them, thus removing the sigils. During the course of the game, you will meet Alias and her friends who will aid you in your quest.

Before starting the game you will be required to create six characters to make up your party. This game follows standard AD&D rules and you can choose from the standard races and classes found in these rules. Because of this, you must be aware of adjustments to character stats and class limitations because of race restrictions which affect your characters' development. Fortunately, the game manual explains this very clearly for those not familiar with AD&D rules.

Human characters can reach the highest class levels which determine the types of spells you can learn and use. Don't take all non-human characters, as this will restrict your party from learning some of the higher level spells you need to finish the game.

However, you will need one female elf in you party if you want to be able to go on the special quest in the caves outside of the town of Hap. This, however, is not required to complete the game.

Once you have created your characters, including assigning colors and size to them, you are ready to begin your quest.

Since there are several good hint books available, I am not going to give you a lot of hints on how to win the game. I will, however, give you some basic things to watch out for or try.

This is a hack and slash type game with very few puzzles, but the game does require some strategy and tactics to survive. If you stand toe-to-toe and just fight it out with some of the monsters you will lose.

This game has a very good save game routine and you will want to use it often, especially before major encounters. Also, you don't have to fight everything you encounter. Except for the major encounters, you can usually avoid a fight if you find yourself over-matched.

9,3 E 08:11 CAMPING

THE PARTY MAKES CAMP...
```

Once you start the game, you will wake up in Tilverton with money but no weapons or armor. Before leaving the room, encamp and have your magic users memorize their spells. Once a spell is used, it must be memorized before it can be used again. The sequence for memorizing a spell is to encamp, choose spells and rest.

If your characters do not rest after choosing their spells they will not memorize them. There is nothing more frustrating than getting into a fight and finding out you failed to memorize your spells.

Each time a character gains a level of experience they can choose one more spell for their spellbook. During the course of the game, you will also find and buy scrolls which can either be used one time directly or else scribed into your spellbook for continuous use throughout the game. Spells can be scribed when in camp, but your character must be of a high enough level to learn the spell. With use of the spell directly from the scroll you can use higher level spells, but only the one time.

Arming the Party

Once your magic users have memorized their spells, leave the inn and go across the street to the Armory and buy your weapons and armor.

Again, this is based on AD&D rules and various races and classes are restricted in the types of weapons and armor they can use. Once again, this is spelled out very clearly in the manual. Take time to look at the manual before buying anything, since your characters can buy weapons and armor they can't use, leaving them unarmed and vulnerable (and lighter in the purse).

After you are outfitted, explore the town. Visit various buildings and talk to different people. Do not attack the guards until you are ready to leave the town because, once you do, you will be forced to leave the town and not be able to return.

This is one of the few weaknesses I found in this game. At certain times, especially in the encounters relating to the removal of the sigils, you will be forced into what I call the "cattle chute" situations. No matter what you do, even if the game offers you several different options, you are forced to follow one linear progression of action.

While this is not detrimental to the overall enjoyment of the game, it is a little annoying—especially when the game asks you to choose one of several options only to find out that the result is exactly the same whatever you choose.

Once you fight the guards after attacking the king (an uncontrollable action because of the sigils), you have no choice but to follow a thief to meet the head of the Thieves' Guild. Rest and save the game at this time, since you will face your first major encounter after this.

Once you leave the Thieve's Guild, you will wander the sewers of Tilverton in search of the headquarters of the first faction you seek. You will be unable to leave the sewers until you have defeated the leader of this faction, removing the first of your sigils.

While in the sewers, locate the secret training hall of the Thieves' Guild where your characters can get training to move up levels with necessary experience points.

After the removal of the first sigil, you will be transported to the wilderness outside Tilverton. You can now travel where you want—except back into Tilverton. Again, do a save game at this time.

Once you leave this area, travel to the various wilderness areas to fight the creatures you meet to gain the experience points you need. In the beginning, these encounters may be a little hard, but later they become cakewalks.

If injured or low on spells, encamp and regroup. A lot of the villages have inns and taverns where you can rest and learn some gossip about the area and what is going on.

When you have gone up a level or two and start to find the wilderness encounters to be fairly simple, you are ready to move on to the larger cities where the major encounters take place.

Gaining Experience

Hap is probably the next easiest town to finish after Tilverton. I, however, preferred to go to Zhentil Keep next. You can enter the town and walk straight ahead until you find the inn where you can rest and heal.

Next door to the inn is an armory and a magic shop where you can buy magical weapons, potions and spells. I like this town because you can fight numerous battles with small parties of evil clerics and mages for large amounts of gold, magical items and experience points, then duck into the inn to heal between battles.

As you gain enough experience points, leave the town and go to one of the villages that have a Guild so you can train and go up levels. Then, return to Zhentil Keep for more battles. Across from the magic shop is the Magistrate's office where you can battle the guards for large amounts of experience points.

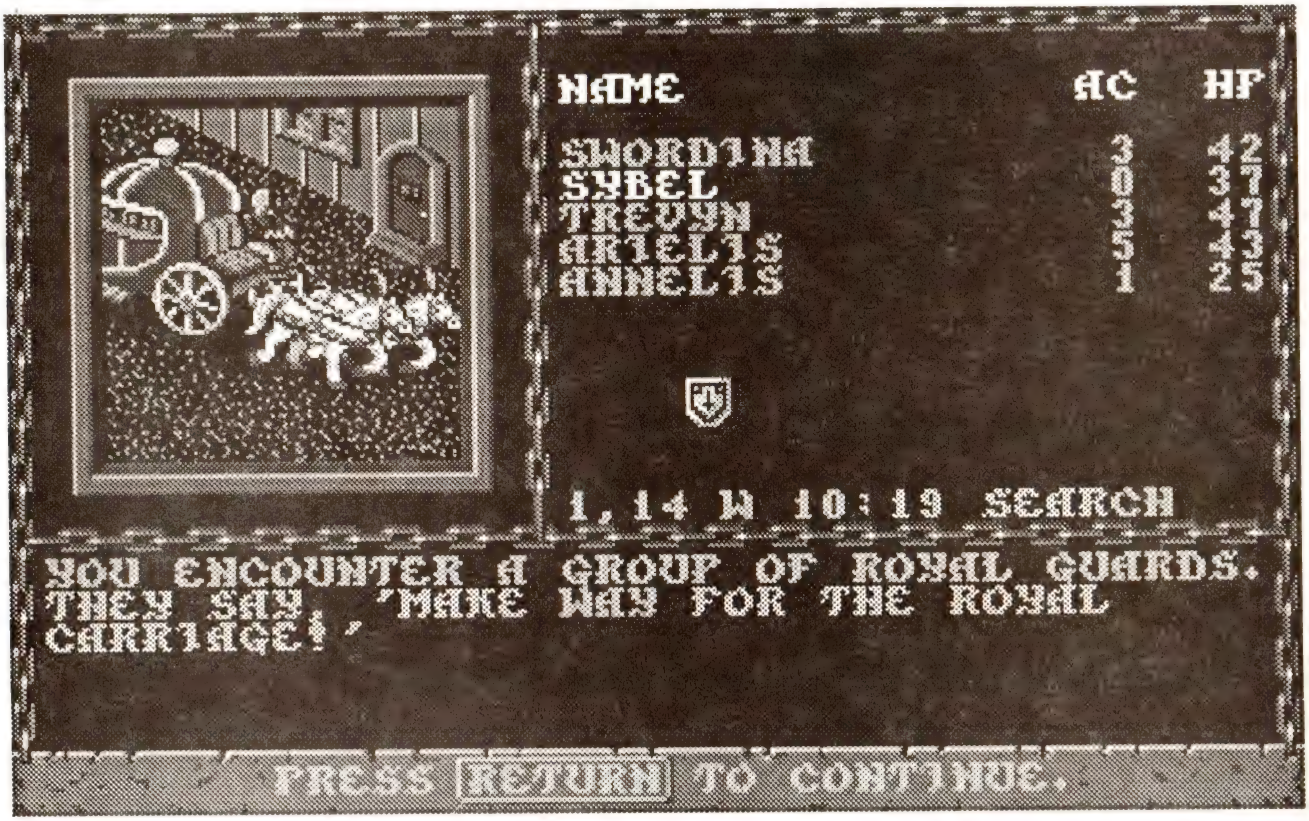
This is a major encounter with back to back fights with two large groups of guards with no chance to rest or flee inbetween fights. Prepare accordingly. A wand of magic missiles from the magic shop is helpful, but it is very expensive. The one error I've found in this game deals with the purchase of the wand of magic missiles. The price list in the magic shop says it costs 40,000 gold pieces, but the actual price is over 80,000 gold pieces.

By going back and forth between Zhentil Keep and the village, your characters should be able to rapidly advance two or three levels before moving on to the next sigil removal encounter. While doing this, do not go beyond the street on which the armory and magic shop are located because it will lead to one of the "cattle chute" major encounters. This particular encounter is the second hardest in the whole game, in my opinion, so you need to be higher level to survive.

Upon reaching three or four levels of experience, you will start to find small dungeons and manors outside some of the villages. They where not there at lower levels and are good for gaining more gold and experience points without too much risk.

After defeating the first four factions, you will now be ready to enter the ruins of Myth Drannor where you will have the final encounter with Tyranthraxus. Defeat him and his numerous evil minions and you win. Lose and your soul belongs to him forever.

I'll give you two hints for preparing for this final



NAME	AC	HP
SWORDINA	3	42
SYBEL	0	37
TREVYN	3	47
ARIELIS	5	43
ANNELIS	1	25

```
1,14 W 10:19 SEARCH
YOU ENCOUNTER A GROUP OF ROYAL GUARDS.
THEY SAY, 'MAKE WAY FOR THE ROYAL
CARRIAGE!'
PRESS RETURN TO CONTINUE.
```

battle. Once you enter the temple, you will not be able to encamp and memorize your spells between battles because of Tyranthraxus' control of the last sigil.

I did discover that while you can't rest, every time you attempt it you can learn one spell no matter what level. All you need to do is keep trying to memorize spells until you have learned all your spells. It is time consuming but necessary if you hope to win.

The second hint is that, when fighting Tyranthraxus, poison cloud spells by magic users in the front row of combat with the fighters in back using magical range weapons solely against Tyranthraxus is very effective.

Last Thoughts

Some final notes and observations. While there is a large variety of weapons and spells available, many of them do not work as well as you would expect. Some are even next to useless or only work properly in certain circumstances.

The poison cloud is a prime example. Throughout most of the game, it doesn't seem to affect anybody, but in the final encounter it is devastating. I had given up on it and only used it the first time because it was all I had left.

The same observation applies to the creatures encountered in combat. Some are immune to your most potent magic spells only to die from darts and stones. So, save your game before entering major encounters and keep trying various tactics until you find one that works.

In playing this game, I missed many of the side encounters which the hint books said were necessary to get special items you needed to complete the game. Despite this, I was able to win the game without using them. Arming all my characters with wands of magic missiles enabled them to handle most of the difficult encounters I faced. I also found Magic Missile and Silence 15 Foot Radius spells to be very effective on evil clerics and magic users.

I strongly recommend this game for all Atari users and I hope enough of us buy this game so SSI will continue to translate more of these excellent TSR games to the Atari format. I also highly recommend TSR's novel, "Azure Bonds," as an excellent fantasy story for those interested in that genre. Some of us at MAST have an AD&D gaming group and are all anxiously hoping and waiting for SSI to release the "Eye of the Beholder" for the Atari ST.

Pattie Rayl

A few months ago, the Bluth Group out of England released a sequel to Dragon's Lair called Dragon's Lair II: Time Warp.

This new game is being distributed on this side of the Atlantic by ReadySoft of Ontario, Canada.

The Premise

Darling Daphne has gone and gotten herself kidnapped again (how could she?), and it's up to you to help Dirk the Daring rescue her before the evil wizard Mordroc places the *Death Ring* on her finger and forces her into an unpleasant marriage.

Dirk is up against some heavy odds. He has to fight slimy moat-monsters, predatory pythons, evil monsters in general and, worst of all, Daphne's mother! He has to do all this before the Casket of Doom is opened and Daphne is lost forever in the dreaded Time Warp.

Observations

The game comes on six special format disks. The manual states that people who have single-sided disk drives will not be able to play as many screens as those who have double-sided drives. The game is auto-booting and copy protected.

The graphics and animation in this game are very good. The graphic style is very cartoon-ish, which makes for part of the charm. The STE is supported with the extended palette of 16 colors out of 4096 choices. The sound comes through loud and clear in stereo, especially Daphne's mother!

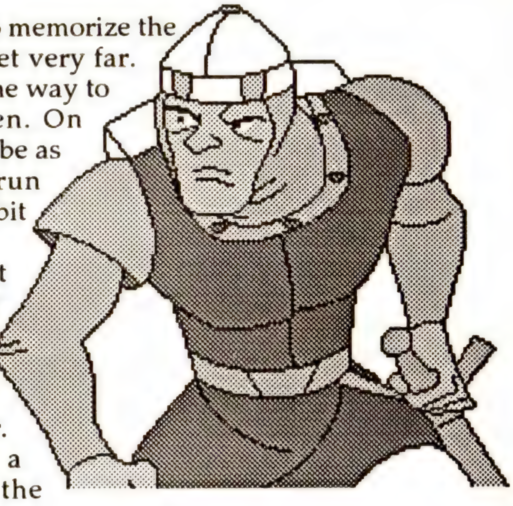
Once you solve the puzzle of which way to move for several animation sequences, the effect is very pleasant. It's like a living cartoon on the screen, and you're a participant.

Those who liked Dragon's Lair and Space Ace will like this new game with animations from Don Bluth. As for me, I can get frustrated easily by certain types of games, and this is one of them.

Game Play

You have to be able to memorize the moves in this game to get very far. Basically, there is only one way to get through each screen. On some screens, this might be as simple as "duck, then run left." Other screens are a bit more complicated.

Once you figure out the proper way to get through a particular screen, you need to remember it in case you die and have to start over. That means you need a good memory to play the



game for any length of time—or the ability to read hastily scribbled notes while in the thick of the action.

The way Dragon's Lair II works is you have three tries (lives) to get through a screen. You have a certain timeframe in which to make each move or you're dead. If you move the wrong way, sorry you're dead! If you don't move at the right time, sorry you're dead!

These kind of games, by their very nature, have a large dose of frustration factor in them if you get stuck at a certain screen. Dragon's Lair II has a couple of things built into it to cut down somewhat on this frustration.

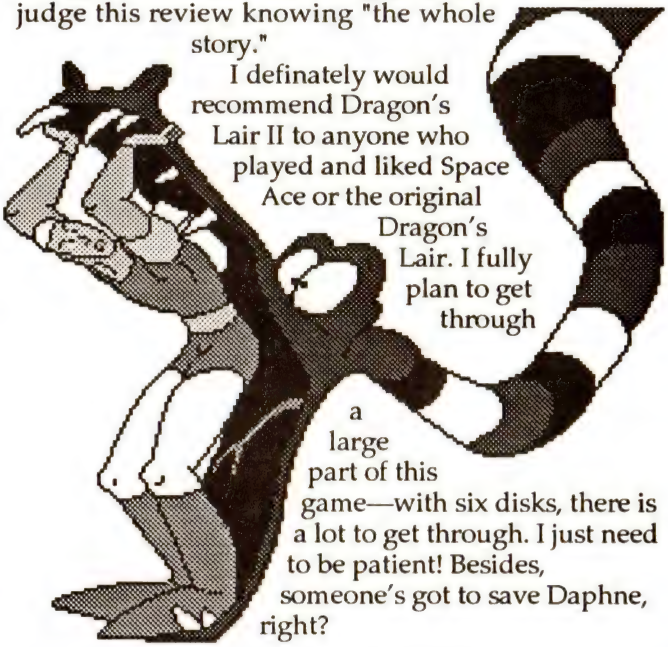
First, you only have four ways to move. You don't have to worry about diagonal movements. Second, you can save the game! You can finish a screen and then save...when you die later on (and you will!), you don't have to go through the excrutiating process of starting from scratch.

Even with the save feature, you often have to do a lot of restarting to get past each screen. If you don't save constantly, you get to start from the last save point each time you use up your three lives.

Some Qualifications

I am far more comfortable playing games like Bloodwych (I & II), Curse of the Azure Bonds, Pinball Wizard and Crystal Castles on the ST (I'm also fond of a shareware game called Glider for the Mac). I also enjoy arcade shoot-'em-ups like Black Tiger and others, but I don't enjoy simulations or wargames.

Occassionally, I *really* like graphic adventures or graphic/text adventures, but I quite often get frustrated by them. Why am I telling you all this? So you can judge this review knowing "the whole story."



I definately would recommend Dragon's Lair II to anyone who played and liked Space Ace or the original Dragon's Lair. I fully plan to get through a large part of this game—with six disks, there is a lot to get through. I just need to be patient! Besides, someone's got to save Daphne, right?

Make your Atari FAST!

WARP 16 FAST!

The WARP 16 accelerator + cache board contains a high speed 68000 CPU that replaces the slower 68000 CPU currently used in your Atari.

By taking advantage of the large amount of high speed cache ram on the WARP 16 board this CPU is able to run programs at twice the speed of an unmodified Atari.

Routine tasks such as spellchecking, spreadsheet calculations, screen redrawing, and laser printing take a fraction of the time they used to.

No longer are you frustrated by waiting for your computer.

WARP 16's custom logic allows caching of both reads and writes AND caching of both "byte" and "word" memory accesses.

What does all this mean?

Your Atari moves FAST! WARP 16 FAST!

Features:
- 16MHz CPU accelerator with cache for all Atari ST/MEGA computers.
- 80K of high speed static ram. Organized as 16K cache-tag ram + 64K cache ram.
- FOUR TIMES MORE cache ram than any other Atari accelerator on the market.
- User selectable "stock ST" mode gives 100% compatibility with ALL Atari software. Even Spectrum 512.
- For use with Atari ST, MEGA, and STACY computers.
- STE version available soon.
- Don't settle for other upgrades that offer tiny amounts of cache ram, or offer compatibility with 80% of existing software.
- WARP 16 offers a full 64K cache + 100 percent software compatibility.
- Dealer inquiries welcome.
- Order your WARP 16 TODAY!

WARP 16 $349.95 (U.S.)

Add $4.50 for shipping and handling. Note: WARP 16 requires installation by a qualified computer technician. This installation may be done at your local computer repair shop. Call us for details.

TEAM YANKEE

BOB RETELLE
(WAUG, MACE)

Team Yankee is one of those games I really, really wanted to like. I'd read the book it's based on, and I was looking forward to a good tank combat simulation. Heck, my all-time favorite arcade game was Battlezone!

The manual starts out with several excerpts from the book, "Team Yankee," written by Harold Coyle. The book details the events of the first few days of a conventional warfare World War III, focusing on an American tank unit stationed in Germany.

Commanded by Captain Sean Bannon, the company, Team Yankee, consists of two American M-1 Abrams tank platoons of four tanks each and two platoons of mechanized infantry and antitank vehicles.

When Russian tanks break through and attack, Team Yankee helps in repelling the main force of the attackers, and then moves north to attack the flank of the main Soviet force. They take several key positions and hold them against heavy counterattacks. After being relieved, Team Yankee leads an attack by the entire Allied brigade deep into enemy held territory.

The book is exciting, well written, and is full of non-stop action. One of the main attractions of "Team Yankee - The Computer Game" is that it uses the tactical situations of the book as its scenarios. In fact, the manual suggests that one of the best aids to learning how to play the game well is to read the book.

There's a lot of interesting information about the armored vehicles involved in the game, as well as some good background about the organization of the Allied and Soviet armored commands. In fact, the manual is one of the better ones I've seen!

Overall, the game does fairly well at capturing the spirit of the Team Yankee novel. Unfortunately there are some minor, and some very major, quirks which detract seriously from the enjoyment of the game.

In any tactical level wargame, one of the very basic problems is how one player can control all the different elements under his command.

In a game like Battlezone, it's quite simple. There's only one tank for you to control, and you don't have to be concerned about anything else. In Team Yankee, there are 16 individual vehicles under your command, and each of them has its own weapons systems with a choice of weapons for each one.

You also need to direct each vehicle according to the overall tactical plan of attack you've developed, and do it at the same time your opponent (in this case, the computer) is commanding his forces against yours.

In "classic" wargames played with pieces on a playing board, this is accomplished by having the game proceed in "turns." Each tank moves and fires in its turn, and any damage to the enemy is resolved before the next tank gets its turn. Many computer-based wargames have used this playing method, but it's an extremely unrealistic representation of real warfare.

Dispelling A Nasty Rumor...
CodeHead Software *IS* Developing a New Product For Atari Computers

The recent August issue of Atari Interface included feature articles and reviews of many of our products. We'd like to thank Bill and Pattie Rayl for a very well-done issue which accurately describes many of the basic as well as the advanced features of our software. But as great as this exposure was, it seems many people have focused an one small paragraph in the issue.

"Now, the bad news." That's exactly how the paragraph in "Editorial Ramblings" started out. This editorial went on to point out that the CodeHeads are registered Macintosh developers and that "While the CodeHeads will continue to support their current products in the Atari market, they 'currently have no plans to release any new products for the Atari market.'"

While these statements are true (or were true when they were made), they have been grossly misinterpreted by many readers. We have had several comments from people who say "I'm sorry to hear you're abandoning the Atari market." Nothing could be further from the truth.

We'd like to make it clear that we in no way blame Bill and Pattie Rayl or Atari Interface for this misunderstanding. They accurately reported the quote as well as confirming with us on the phone before printing it.

We've made the statement about not planning any new products several times and are only beginning to realize what a mistake it is to say this. It just doesn't make good business sense for a number of reasons:

There are probably only a few (if any) Atari developers who are currently planning any new releases, but they don't publicize this fact.
We've always stated in the same breath that we will continue to support our existing products as long as there are even a couple of inches of the Atari ship above water, but this is usually ignored.
We made the same statement (about no new products) before releasing our CodeKeys program a year ago but it didn't stop us from writing and releasing this useful tool.
We are currently planning a new release for the Atari market!!!

We're not ready to present a full press release yet, but we are developing a MIDI recorder called MIDI Spy. It is an accessory which records and plays back MIDI data in the background. Full details about MIDI Spy will be released in an upcoming press release. This is something musicians have been waiting for!

NEW!

Quick ST 3

Software Screen Accelerator and Desktop Customizer

MAXIMUM SPEED FOR YOUR ST OR TT!

Speeds up most ST software by speeding up screen graphics.
Compatible with all ST, STE, and TT computers and monitors.
Supports all screen resolutions, including Moniterm and ISAC.

Easy to use! Install it in the AUTO folder or run it from the desktop.
Includes the Quick Index 3, *the* benchmarking utility.
Includes MonSTer, the high resolution screen emulator.
Install any DEGAS, Neochrome or Prism Paint picture on the desktop.

Absolutely the fastest screen accelerator! For benchmark results, write for our FREE newsletter.

Upgrade From:
Quick ST II - $15
Turbo ST - $20
(with proof of purchase)

Don't settle for imitations. Only Quick ST 3 speeds up all screen resolutions on all monitors.

We have compiled statistics of the speed increases you can obtain with your favorite software and put all tje results in our summer newsletter. Write for your free copy today.

Branch Always Software
14150 N.E. 20th. St. #302
Bellevue, WA 98007
Phone: (206) 885-5893

Quick ST 3 is now available at a price of $34.95 U.S. Dealers may sell for less. 1 megabyte of RAM and TOS 1.4 (or higher) is recommended to use all of the features.

To order by phone call: 1-800-255-8220

AAAUA ATARI 8-BIT USER GROUP

PRESIDENTIAL PONDERINGS

It's that time of year again. Yes, AAAUA elections are held in November. We are currently putting together nomination and audit committees. This is always a difficult time of year. Veteran officers who have served two or more years are wondering if it is not time to give someone else a chance. And members in general are anxiously looking about for someone ELSE to accept the nomination. How refreshing it would be to have members clamoring for the opportunity to serve and to have two or three candidates for each officer position!

It occurred to me that perhaps a gavel is unnecessary for most user groups. If the presiding officer wants the membership to come to order, he or she need only ask for a volunteer and a silence will fall over the assembly! "Why is that?", I wondered rhetorically one day. A person in my company suggested that it is because many members feel that they have paid their dues and that this entitles them to have the officers take care of all the administrative details.

Could this be true? Haven't these members considered that the officers are also dues paying members and that they too would enjoy participating in some of the user group activities? Even if the user group does not require their officers to pay dues as a token of appreciation, this scarcely begins to cover the time and energy required to keep the group running smoothly. So, how about it, members? Isn't it time YOU got involved? Isn't there some position that you would be able to fill? If you are a new member and are reluctant to assume a lot of responsibility all at once, then consider volunteering as an appointed assistant. There are many ways you can help and make your user group even better than it already is. I know you will benefit from the experience. And chances are you will even enjoy it. So don't be bashful. Speak up at the next opportunity and let your officers know you are willing to help. You will be glad you did

BRAG*ST NOTEBOOK

Our July 18th meeting went very well as we had nearly a full house and a good time seemed to be had by all. Computer Challenge donated to the club an Atari banner which we now display at the meetings. Mark Pierro held a beginners corner before the meeting. Demo'd at the meeting were Cyber Paint, a MIDI demo of Easy Score and Edit Track by Lou Krueger. Gerry Genson then demo'd Lemmings, a nifty and different type of game. After the break Bruce Stringer demonstrated NeoDesk 3.

The software raffle won by Kevin Blest so he got to take home Lemmings. Our new door prize raffle was well received by the members especially the winners: Mike Berkley won a mouse pad, Bruce Stringer 5 blank disks, and Bob and Carol Bauer won a bag of cucumbers donated from the garden of Mr. JoPeter Ueckeroth.

See you at the next meeting, and remember let us know what type of programs you would like to see at future meetings.

Middle Georgia Atari Users Group

M.G.A.U.G.

AUGUST MEETING

Another great meeting with good turnout. We had one computer at the meeting (mine) and a few new programs. A lively discussion was held by all on what's new at Atari.

We also had a discussion on the upcoming computer show at the Houston Mall on October 5th. Be sure to sign up for the show so that there will be no surprises when showtime comes. If you have an extra table available then that will be a great help.

outstanding. Remember to slip a few bucks to Bob and Ed if you use these programs. Ed no longer supports the 8-bit line anymore, by the way. I have his MAC/65 cartridge. John Sandgren showed the ARC features of the SpartaDOS X cartridge. Everything is built-in and super fast!! It was really slick. (That was the last straw for me. I bought one of those hummers, since they are on sale with ICD.) The meeting went long and fun was had by all.

At the July ST SIG, Terry Quinn went through a handout on how to UNARC and ARC ST files. Sam Cherry also showed a number of "driving programs" like Test Drive II which were pretty neat. We also added a few members at the meeting. We are also going to have a special program on MIDI in August.

Please check your mailing lable to see if your dues are up and get paid up. And remember, if you are having a problem with anything, please give one of the officers a call. The club even has loaner hardware if you go down and get into a pinch. We're here to help!!!

See you at the next SIG meeting.

Rick Reaser, P3ACE President
(Home) 380-8082
(Work) 554-5905

PORTS ATARI
PACE
COMPUTER ENTHUSIASTS

Guess what happens when the weather turns cold and the outdoor chores are done for the season? Computing! What better machine to "hack" with but your Atari 8bit or ST?

Upgrading to TOS 1.4, install a memory upgrade, install a high density drive, install a Happy or US Doubler, add a hard disk, add a 16 Mhz 68000 to your ST, install a 68030 board, or even break down and buy that complex program you have been dying to run on your computer. You have all winter long to enjoy your Atari, so make the most of it! Your Atari and our loyal third-party vendors will appreciate your generosity.

Meetings have resumed and turnout is always robust. Our first project of the year will be to upgrade the memory of our clubs' 520ST. If anyone is willing to volunteer to try it, and if you're qualified, the burden will be on your shoulders. The club will pay for the upgrade and maybe we can all watch your handiwork at one of the meetings!

Not all SIMM's are created equal! I found out the hard way. I upgraded my STe to 4 megs recently, but not without some disappointing experiences. The first quad arrived and I immediately installed them. After running every system_info test I had, the report showed only 1 meg was installed. A second batch came and still the same 1 meg. Doug, at Rising Star Computers, sent me four more, but from a different manufacturer. Presto, FOUR MEGS!

Our AIM's have been arriving, well, rather slowly this summer, but no one is complaining. Receiving any kind of information about Atari computers is welcome at our home. There are no vendors in Duluth/Superior carrying any kind of Atari magazines. That's really too bad. AtariUser is still coming regularly, and we have sent them a check for their job well done.

R.A.C.E.

Welcome to yet another issue of AIM. Well I don't have much to say about club activities, but hopefully Eric will add some to this letter.

My name is Robert Yates and I am the Sysop of our BBS. In this month's letter I want to talk about the BBS and point out some of its features. The BBS software I am running is Michtron's BBS 3.0. I selected this software because of its ease of use and very simple set-up procedures.

For those of you who have no modems, take heart, the club has two modems with RS-232 cable and software to lend to you. Call Eric Schofield at 851-5134 for more information about the modems.

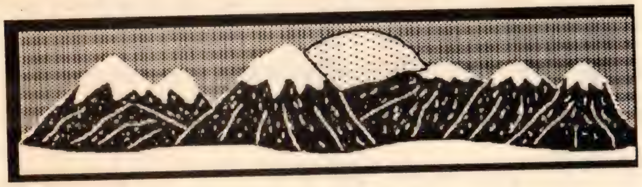
The BBS is called the Galaxy BBS. When I first considered starting a BBS, I asked Club members what features they wanted or expected from a BBS. The two most asked for features

We had three great disks to give away to members at the meeting including 2 from AIM (July and August) and of course the disk that I made up. We also had the Atari User magazine for August to distribute. That's about $15 to $25 worth of software and magazines at this meeting alone. If you wern't there then it is your loss.

Lee Benjamin gave a nice demo of the new control panel from Atari - mainly for the STE and TT but also usable on the 520 and 1040ST line of computers. Lots of nice features and the ability to configure which modules that you want to load to save memory.

There will be NO computer meeting in October because of the show so don't forget - just be sure to come to the show and see us or better yet bring your computer and join in the fun.

Until next time, hope to see you at the show.



The Prez Sez by Rick Reaser

Blank disks are in!! We put in a mass order for blank disks for the club and they are now in. 5 1/4 inch disks are available for 25 cents each, while 3 1/2 inch disks are available for 35 cents each. Pick up yours at the meeting or give me a call. We bought 100 5 1/4 disks and 500 3 1/5 inch disks. Thanks to Sam Cherry for doing all the leg work. We can order more if we run out.

For our modemless friends, the club has a loaner Hayes 300 baud modem with cables that you can check out. We are also buying one of those Atari SX-212 modems that is on sale through Damark. the SX-212 can connect directly to both 8-bit and ST computers. If you don't have a modem and are low on cash, this is the modem for you. You can order one from: Damark Industries, Inc., 7101 Winnetka Avenue, North, P.O. Box 29900, Minneapolis, MN 55429-0900. Request item number B-476-181504. You can also order by phone with a credit card (AMEX, MC, VISA, DISC) by calling 1-800-729-9000. The price is $19.99 + $5.50 S/H. Go for it. If you are unsure as to whether you need telecommunications, check out the loaner modem.

Speaking of telecommunications, our new BBS home is Wildcat Orphanage (392-6631.) Other local BBSs that support Atari computers are Chris Smith's Last Castle (390-9837) and Bruce Faulkner's Board (574-7406).

Here is the list of the people in P3ACE that are on GEnie along with their GEnie mail addresses.

Matt Allard	M.ALLARD4
Sam Cherry	S.CHERRY4
Ed Fletcher	FLETCH
Fred Koch	F.KOCH
Dave Koster	D.KOSTER
Roger Meston	R.MESTON1
Michael Miller	M.MILLER4
Brad Moravek	B.MORAVEK
Rick Mount	R.MOUNT
John Peters	ST-GUEST
Terry Quinn	T.QUINN1
Rick Reaser	R.REASERJR1
John Sandgren	J.SANDGREN
Robert Sandlin	R.SANDLIN1
Tom Scanlan	T.J.SCANLAN
Jerry Sundee	J.D.SUNDEE
Kim Swift	K.SWIFT
Jeff Traczyk	J.TRACZYK1

(Dave Koster is still technically a member of our club even though he moved to Ohio. Drop him a line sometime.)

Hopefully, this list will allow some of us to communicate more via E-mail on GEnie. Remember that you get all the E-mail you can stand as a part of the $4.95 monthly fee on GEnie.

For those of you not on GEnie, it is the place to be in terms of "pay" telecommunications services. It's a local number, so there are no toll charges as well. To join GEnie call 1-800-638-8369 on your modem, half duplex. When connected, type "HHH." At the "U#=" prompt, type "SIGNUP" and press return. Follow the instructions and have your credit card or checking account number ready. Hope to see the E-mail flying on GEnie. There are already quite a number of us that past hot info on GEnie.

We now have the AIM 8-bit Disks of the Month in our possession. There are available for 50 cents apiece at the 8-bit SIG or give us a call if you can't make it to a meeting.

We also get AtariUser Magazine. They are available free at the SIG meetings. Back issues are also available.

The August 8-bit SIG was a complete demo of archiving programs. Some members have had problems with all this. Rick Reaser demoed Bob Puff's SuperARC and UNARC as well as Disk Commander. Rick also showed the "View" facility available on Ed Bachman's WEDGE for SpartaDOS 3.2. All these shareware programs are were E-mail and Z-modem. At the present time Z-modem protocol is not supported by Michtron BBS 3.0. But E-mail and F-mail are available and are a part of the BBS.

E-mail is private mail sent to another user and this mail can only be read by the person the mail is sent to. F-mail is like E-mail but you can send another user a file instead of a message.

Other features of the BBS include X-modem, Y-modem, Y-modem Batch and ASCII file transfer protocols. These protocols will help you to upload and download file to or from the BBS.

There are 14 accessible sigs to all RACE members. Some of the sigs include: Atari online—this sig contains on-line electronic magazines such as ST-Report, Z-Net and Lamp from GEnie; RACE members only—this sig will contain the newest public domain programs out for the Atari ST; IBM emulation—this sig contains programs and GIFs from the world of the IBMs; MAC/Spectre\GCR—this sig contains programs for the MacIntosh computers; and 9 other sigs for the Atari ST and one sig for the Atari 8-bit computers.

The BBS is up and running 24 hours a day. Remember gang, this BBS is yours to use and enjoy! Give it a call and tell me what you think of it or suggestions for improvement.

The next 2 months meetings are as follows: September 24 and October 22. These meetings will be at the Richard B. Harrison Library starting at 7p.m. as usual. If you have any questions, please don't hesitate to call the officers. See ya at the next meeting gang!

SCAT SUBURBAN CHICAGO ATARIANS
AN INDEPENDENT COMPUTER USERS GROUP

Suburban Chicago Atarians News for October 1991

The general meeting of SCAT has been changed to the First Saturday of the month. This change has been in effect since the September meeting. The next club meeting is on the 5th of October.

The Demo planned for October is to connect a Hewlett Packard Deskjet 500 and a IIP to an Atari ST. We then plan to put the printers thru their paces. We as a club have had demo's for about the last six month of everything possible dealing with productivity programs and hardware. This demo because of hardware required will be the "mother" of all Demo's. Please plan to attend.

By the Way. The November meeting is nominations of officers for 1992. The election and Christmas party will be in December.

San Diego
Atari
Computer
Enthusiasts

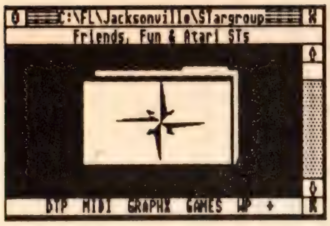
It's August as I write this and we just completed another highly successful Atari Swapmeet. We had quite a turnout, with a great many transactions going on. There was a lot of software and hardware exchanged which had previously been gathering much dust on people's shelves.

We recently have been priviledged to get an excellent group of demonstrations including a a demonstration of a true multitasking environment called MULTIGEM, demonstrated by Richard Betson of RIMIK Software.

We also saw a prototype Turbo-25MHZ accelerator board by FAST Technology. This board will probably never be anything other than an oddity, but it shows what can be done if a developer really puts his mind to it. Now if we could only get these guys to talk to each other...

On August 19th we will see the new Gadget's by Small SST board. Former SDACE president Mark Booth will be demonstrating this new accelerator at our regular monthly meeting. This should be a good prelude to the upcoming Glendale, California Atari Show in September.

For future meetings, we anticipate a MIDI presentation, probably more products from RIMIK, and maybe another foray into Desktop Publishing. Hope to see you at an upcoming meeting.



The STargroup is a computer club specifically for helping members use their Atari STs. Now is the perfect time since our yearly dues are only $15 and now include a quarterly newsletter along with a year's subscription to AIM. Other benefits include free access to our library of over 50 megabytes of Lharced public domain and shareware programs for your Atari and extra time on the STargroup BBS, the Bandersnatch (904) 642-7682.

The late breaking Atari news here in Northeast Florida is that we have just discovered a new local user group called F.A.C.E.(First Coast Atari Computer Enthusiasts). We have already met with them and decided that our clubs should have a joint meeting roughly once each month. They have a lot of interesting ideas and we are really looking forward to combined efforts. Keep watching this space for a list of meeting dates!

Diamond Back II

Simply the **FASTest**, easily the most **FLEXIBLE**, and absolutely positively without question the most **RELIABLE** hard disk backup and restore program for the Atari ST!

- EASY to use 100% GEM user Interface ▼ Online Help
- Point and click to select specific backup paths and files
- Backup/Restore ANY number of specific files or paths
- Creates 100% normal TOS files! ▼ Full/Partial Restores

- Flexible include/exclude wildcards for backup/restore!
- Incremental backups ▼ Load/Save Configuration files
- Compression & Encryption ▼ CRC Validation Logs

Extra Special Features:

- Backup/Restore **Spectre** partitions! ACK & 3.0 OOP
- Intelligent Image option only backs up sectors w/ data!!
- Incredibly fast hard disk to hard disk backups!!!!!
- Full support for TT and 1.44M High Density Floppies

Same low price: $44.95
Upgrades to Diamond Back II V2.26 are only $5 from any version 2.20+ or only $10 from any version 2.11 or before(w/new manual).
Send your original disk and upgrade fee to:

Oregon Research Associates

Put the Power of the Latest Computer and Color Desktop Publishing Technology to Work for You!

What Is Desktop Publishing?

There's a revolution going on out there. In the past, you had to pay top dollar for B&W and full-color, camera-ready copy. Traditional typesetting and paste-up was a time-consuming and expensive process.

Today, Desktop Publishing (DTP) software has the power and flexibility to give you low-cost, high-quality documents, even in glorious full color!

The personal computer of today can run circles around the mainframes of ten, or even five, years ago. The DTP software of today equals or surpasses the capabilities of today's mainframe page design software.

There's a revolution going on out there, and Desktop Publishing is winning.

Use the Power!

At Unicorn Publications, we put the power of today's personal computer and desktop publishing software to work for you.

From textual reports to full-color, graphic-oriented documents, we can give you quality output that pleases the eye and the pocketbook.

Join the revolution today!

Unicorn Publications DTP Price Guide

Laser Printed Pages

1-25	$.60
26-50	$.50
51+	$.40

Résumés

Complete Résumé Package One-page résumé, 25 laser printed copies on résumé paper, 25 matching blank sheets and envelopes.	$20.00
One-page résumé w/laser print	$12.50
Additional pages	$ 5.00

Labels

B&W Diskette Labels (per sheet)	
3.5" (9 labels/sheet)	$ 1.50
5.25" (12 labels/sheet)	$ 1.50

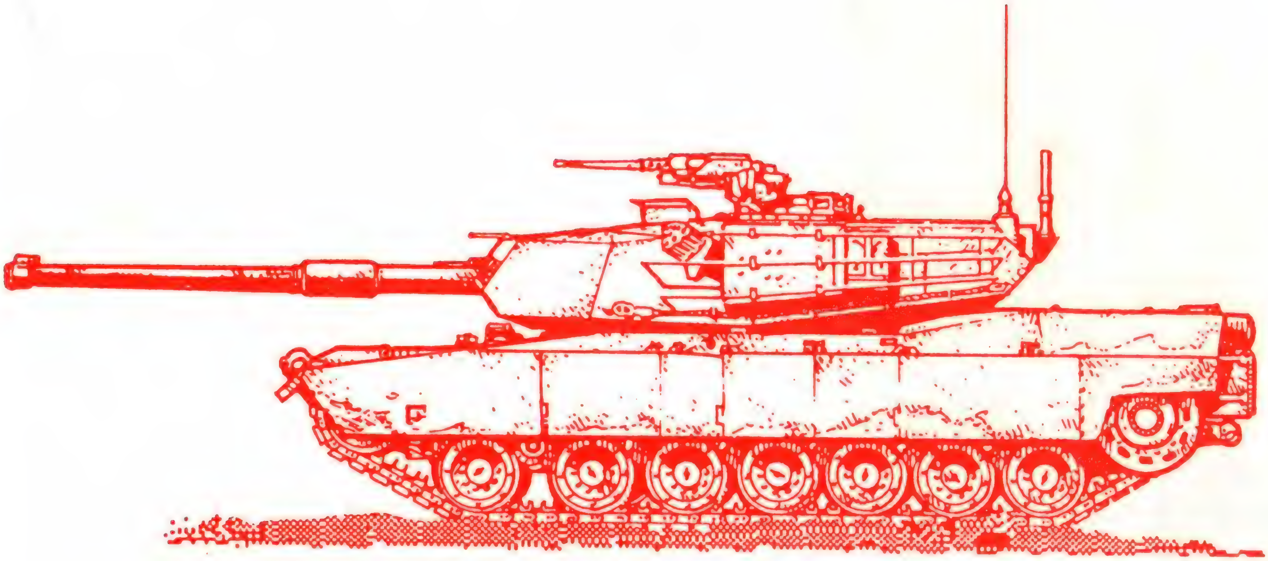
This Price Guide was designed entirely on our DTP system and printed on a 300 dpi Postscript laser printer.

Note: All pricing assumes 300 dpi Postscript color or B&W output. Call for prices on high-resolution Linotron output.



In real life, a Soviet T-72 battle tank is *not* going to wait its turn before blasting you!

Thus, "realtime" wargames like Team Yankee have been attempted, with the action proceeding non-stop and all the various elements moving and firing all at once. The main problem with this kind of wargame is, again, how to control so many different elements all at the same time.

Team Yankee partially solves the problem by breaking the 16 vehicle unit down into four squads. You move, aim and fire for each squad as if each was a single tank. This reduces the actual number of elements under your control to four, which is a lot more managable but still quite demanding.

The game can be played from floppy disks or can be installed on a hard drive. The "copy protection" consists of having to identify three of the armored vehicles from the game, using sillhouettes contained in the game manual.

Playing Team Yankee

There are five scenarios in the game, corresponding with battles in the book. Each scenario must be won before you can proceed to the next, which means you can't skip one that may be giving you trouble and come back to it later. After completing the set of five battles, you're advanced in rank and can play through the set again, each time with harder difficulty levels.

Each scenario starts out with an overview map and a notebook giving details of the battle and its objectives. You can call for artillery support at this time and set the time for each barrage.

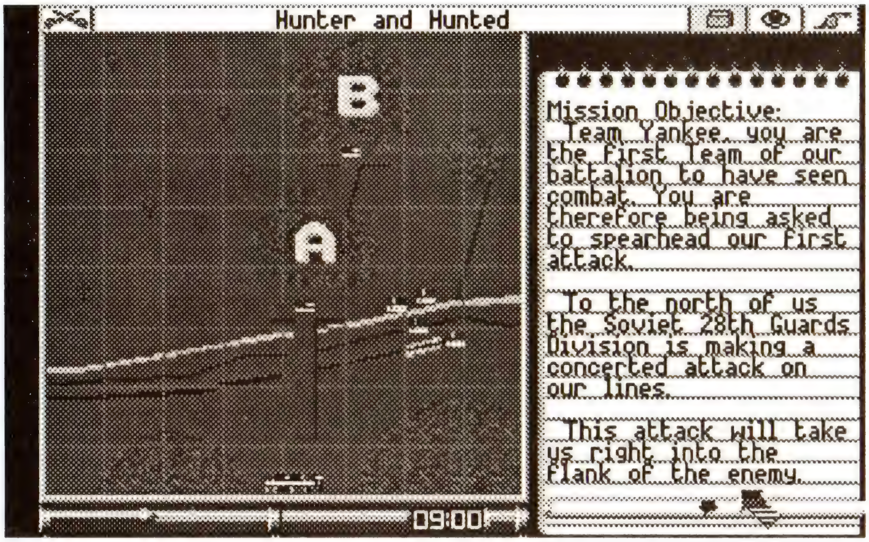
The main screen of the game can display either one unit at a time, or a "quadrant mode" which shows all four units at once. The display for each unit can be an overhead map view of the unit, a status display of the damage a unit has taken, or a 3-D "cockpit" view showing the battlefield in front of the unit's turrets.

Drawback in Viewing

Unfortunately, the quadrant view, while interesting, is almost useless during gameplay. To be fair to the game, the main cause of the problem is the relatively poor graphics resolution of the Atari ST. Even in low resolution, there just aren't enough colors or pixels available to really be able to make out the enemy tanks at almost any distance beyond point-blank.

In any kind of warfare, sighting of the enemy, ranging and aiming are all important. Thus the development of camouflaged, low-profile vehicles, and even Stealth technology. It's only natural that "finding the enemy" is an important part of any combat simulation.

But, while you're peering myopically at the screen and trying to decide whether that jumble of green pixels is a tank or a bush (and then whether the tank is a friend or foe), the Soviet commander (the ST) has no similar problems at all. Your entire command can be blasted out



Mission Objective:
Team Yankee, you are the first team of our battalion to have seen combat. You are therefore being asked to spearhead our first attack.

To the north of us the Soviet 28th Guards Division is making a concerted attack on our lines.

This attack will take us right into the flank of the enemy.

from under you while you're still swinging your turrets around trying to find the enemy (and that's at the *easy* levels!).

The other drawback of the quadrant mode is that there are several controls which are just not available on that screen. You have to go into full screen mode to make use of the smoke generator, laser rangefinder, telescopic zoom and infrared viewer. I found myself using full screen mode exculsively, once I got into the game, switching between the different squads when needed.

Even in full screen mode, and with the telescopic "zoom" engaged, it's still very difficult to make out the enemy at a distance. The lifesaver here is the infrared viewer. Just as on a real battlefield, the Allied forces have an advantage through their technical superiority. Since the engines in a tank put out a lot of heat, infrared sensors will pick them up as very bright objects compared to the surrounding terrain.

Viewing by Infrared

At times (most of the time, really) the infrared viewer will be the only way to see the enemy at a distance. Unfortunately, the infrared has some drawbacks too. It completely blanks the screen, displaying in green on black only those objects which put out heat. Thus you can no longer see roadways, rivers, buildings or anything else that's relatively cool.

Also, it's *extremely* difficult (even moreso than with the direct view) to tell whether a tank is an enemy vehicle or a member of a friendly unit when using infrared. Your shots are just as deadly against friends as against foes, and it's not nice to kill the other members of your team.

Other annoying quirks include problems with the "loading" of the tanks' guns. In an effort to maintain realism, there is a delay built into the game to simulate the time it takes to actually load a shell into the main gun. I have no problem with that at all.

What's extremely annoying (and possibly a bug in the program) is that every time you switch to the map screen and back again, you have to wait for your guns to load, even if they were loaded when you went to the map.

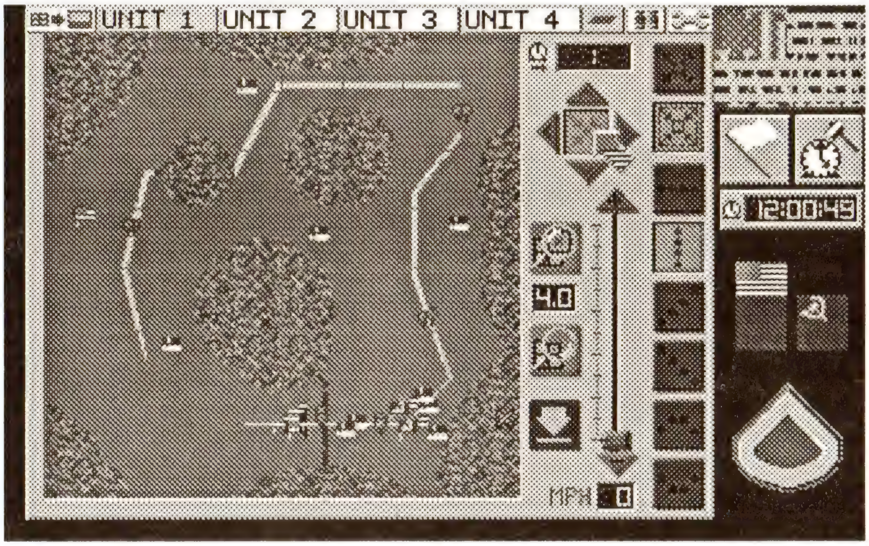
One unit is made up of Bradley Fighting Vehicles which only have machine guns for weapons, and armored personel carriers with TOW missile launchers which take much longer to load than main cannons. It's aggravating to come out of map mode and have to wait as your missiles are loading *again*, while Soviet tanks are taking potshots and you're sitting there completely unarmed and helpless.

Perhaps the worst flaw in the game, however, is that there is no way to steer your tanks. Let me repeat that, in case it seems a little unbelievable. There is *no way* to steer or control your tanks from the main view screen. You can rotate your turret 360 degrees, fire the guns, choose different weapons, but you cannot control the movement of your tank *at all*.

Lack of Movement Control

All movement is commanded from the map screen, in much the same manner as the "boardgame" wargames. You set a destination and ground speed, and the tank takes a straight path from where it is now to the destination. Only one destination can be set, so you can't program a path for it to follow, whether it be to follow a road, or bypass a woods, whatever. You always go in straight lines from here to there.

If you want to alter the speed or direction of your tank, you have to leave the main 3D viewscreen (sort of like closing your eyes during a battle, with Soviet tanks blasting away around you) and go to the map



screen. There you can set a new destination point and speed. You can't just turn your tank to face an enemy as you would in a real battle, to present the smallest profile and the heaviest armor to the ememy guns, you have to set a "destination."

If you suddenly spot a line of Soviet BTRs coming out from behind a group of trees, you have to go to the map screen to slow down or stop, giving them a perfect opportunity to blow most of your unit away while you're clicking on icons. Worst of all, you may have to watch targets disappear from view as your tank goes careening on its pre-programmed path before you can do anything about it.

It's hard enough to find the enemy in the first place, much less trying to reverse course to find them again.

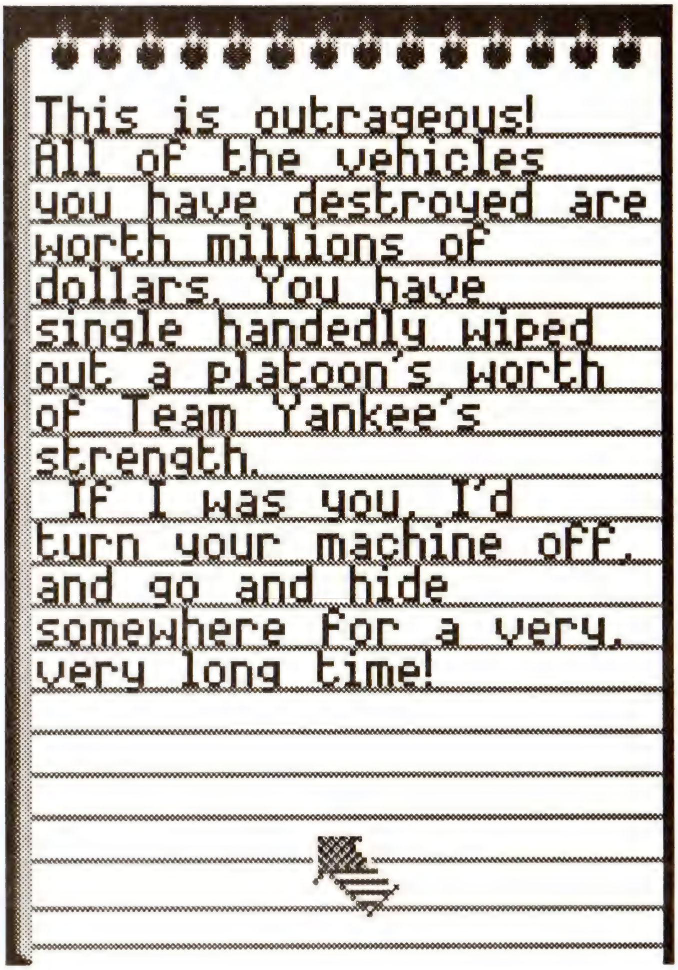
This particular method of movement control can also be very annoying when you're carrying out "search and destroy" missions in wooded areas. In the first scenario, the mission objective is to destroy enemy resistance around one wooded point, then proceed to occupy and hold a hill just beyond.

Can't Win for Losing!

I felt I'd met those conditions when I had a tank unit stationed on the hill and was roaming freely around the first objective unopposed. My second tank unit was driving around the woods like it was on parade in Red Square, just asking for the few remaining Russian tanks to attack it, and still the game told me I'd lost the battle because I hadn't wiped out *every* Soviet unit.

The next time I played the scenario, I ended up searching the nearby village building by building, then slowly creeping along the pathways in the woods looking for the last few enemy tanks hiding in there.

Instead of simply driving my tanks along the paths, it became a frustrating matter of going to the map screen, placing my "destination" a dozen yards or so in what I hoped was the right direction, then quickly returning to the 3D view so I could scan the area for the enemy before my tank stopped at its "destination" and I had to repeat the routine (all the time waiting for my guns to reload after switching to the map screen).



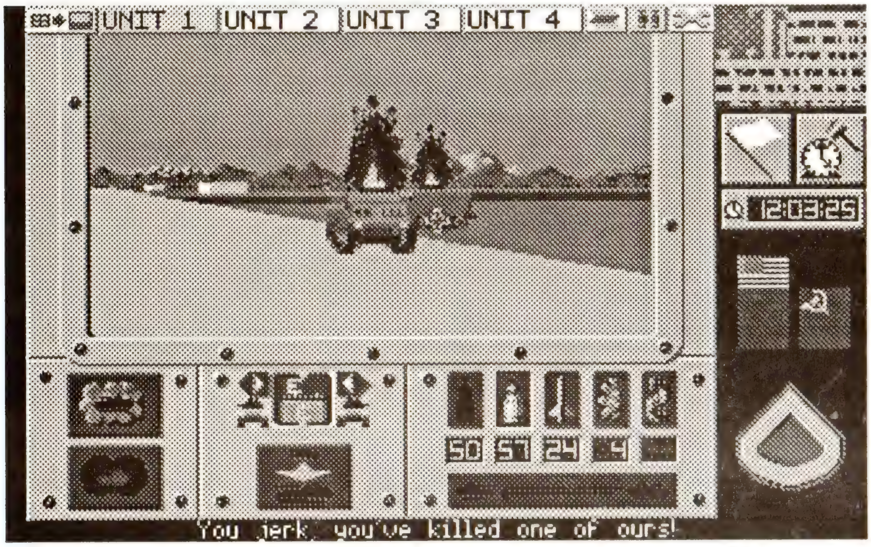
This is outrageous!
All of the vehicles
you have destroyed are
worth millions of
dollars. You have
single handedly wiped
out a platoon's worth
of Team Yankee's
strength.
If I was you, I'd
turn your machine off,
and go and hide
somewhere for a very,
very long time!

I found two of the remaining tanks that way, and was creeping along through the second woods when the game again told me I'd lost the battle because I took too long. Aaarghh..!

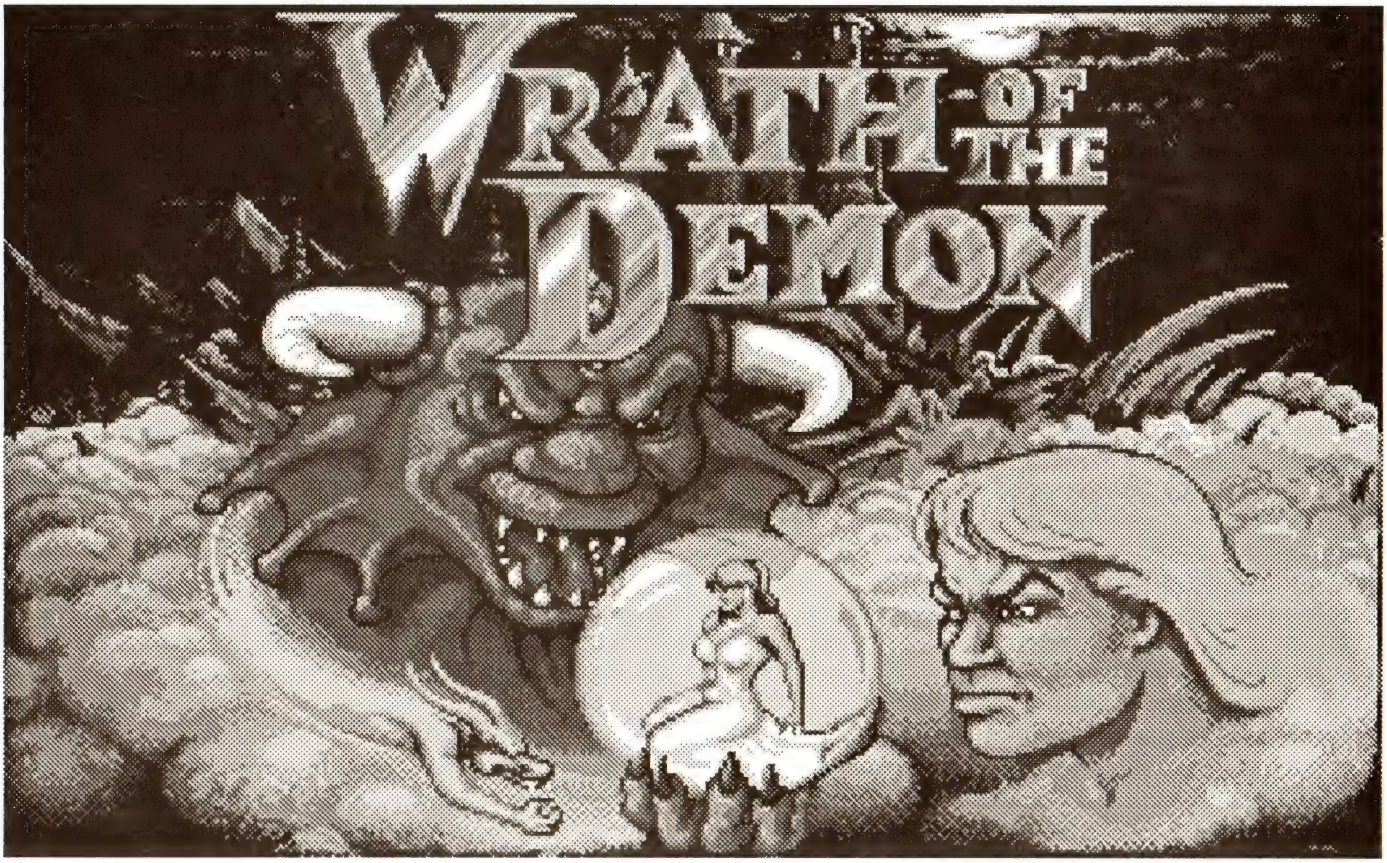
I suppose it sounds like I didn't like "Team Yankee" very much, which really isn't true. I did like it, but it's one of those games which could have been a *lot* better. With better movement controls, and a few of the little quirks fixed, it would be a very good tank combat simulation, especially with its ties to the "Team Yankee" book.

The game really has a good "flavor" to it, with very good graphics and sound, and a *very* nice opening animation. If it wasn't for those "rough spots." I'd be able to recommend it without hesitation.

If you can live with some quirkiness, and the awkward movement, Team Yankee is worth a try. If you haven't already done so, get the book and read it, then see if you can match the exploits of Team Yankee's Captain Bannon.



You jerk, you've killed one of ours!



Bill & Pattie Rayl

The dread Wizard Anthrax has released upon your quiet kingdom a horrible Demon in an attempt to take over the throne. The King has called upon you to save the realm, and even promises to give his daughter's hand in marriage should you succeed in killing these evil creatures. You and your horse are highly motivated!

Action!

Yes, that's right, your horse is in this with you, for awhile anyway. In the first phase of this game, you and your horse attempt to get through the gauntlet of obstacles and flying creatures as you race off to save the world from the clutches of evil.

The horse has to jump over rock piles, snakes coiled in the road, crates, rocks, skeletons and more. Meanwhile, you have to punch out flying bat-like creatures and try to pick up all the potions you can (you'll need them for the remainder of the game!) Whew! It's quite a challenge hanging off your horse and grabbing potions off the ground while keeping an eye out for nasties. And this is only the first scene. There are lots more, and they are all challenging.

Next on the Agenda!

Once you succeed in getting through this gauntlet (hopefully with your maximum of three each of shield, zap and healing potions), you're off to fight goblins in the woods. Goblins are not very nice creatures, and the two you meet here are no exception. While one of the goblins advances on you with axe drawn, the other stands back and throws rocks and knives at you.

Using your sword, you attack the advancing goblin...while dodging and ducking the knives and other projectiles being hurled by goblin #2. If the goblins kill you, the one with the axe gets *real* happy. It's worth dying once or twice just to make him happy...but only once or twice.

This is where your faithful "Hiho, Silver!" horse deserts the cause. That's right! You beat back a goblin double-team, only to find that you have to hoof it on foot from now on. And to make matters worse, you walk right into a dragon's lair.

More Fun in Store!

Now, this is one of the strangest dragons you're ever gonna meet. (Well, actually you've got 120 different monsters to encounter in Wrath of the Demon, so it's a little early to make an observation like that!) This dragon, though, sure can kick-box! This bugger is tough (but not frustratingly so) and his big feet make him hard to get close to. Once you defeat him, he shrinks down to about "mouse-size" and runs away. Great stuff!

The next level starts in a large underground cave with stalagtites, gory markers and lots of bouncing, crawling and flying nasties! In all, there are 600 individual screens in Wrath of the Demon. This is one game you'll be playing for awhile! Thank goodness there's a Save Game feature.

Great Graphics

When you first boot Wrath of the Demon, the whole first disk (there are four disks) is devoted to a rather nice animation that sets the stage. The graphics in the animation are very good. In fact, Wrath of the Demon is a graphics junkie's dream come true. The game has 3.5 megabytes of graphics data in it!

The animation feel is carried over to the actual gameplay, as are the excellent graphics. When you're galloping through the gauntlet, the clouds, fields and mountains in the background all give a very nice perspective of movement.

Even the weeds in the foreground move, and at a different rate from the grassy fields in the background.

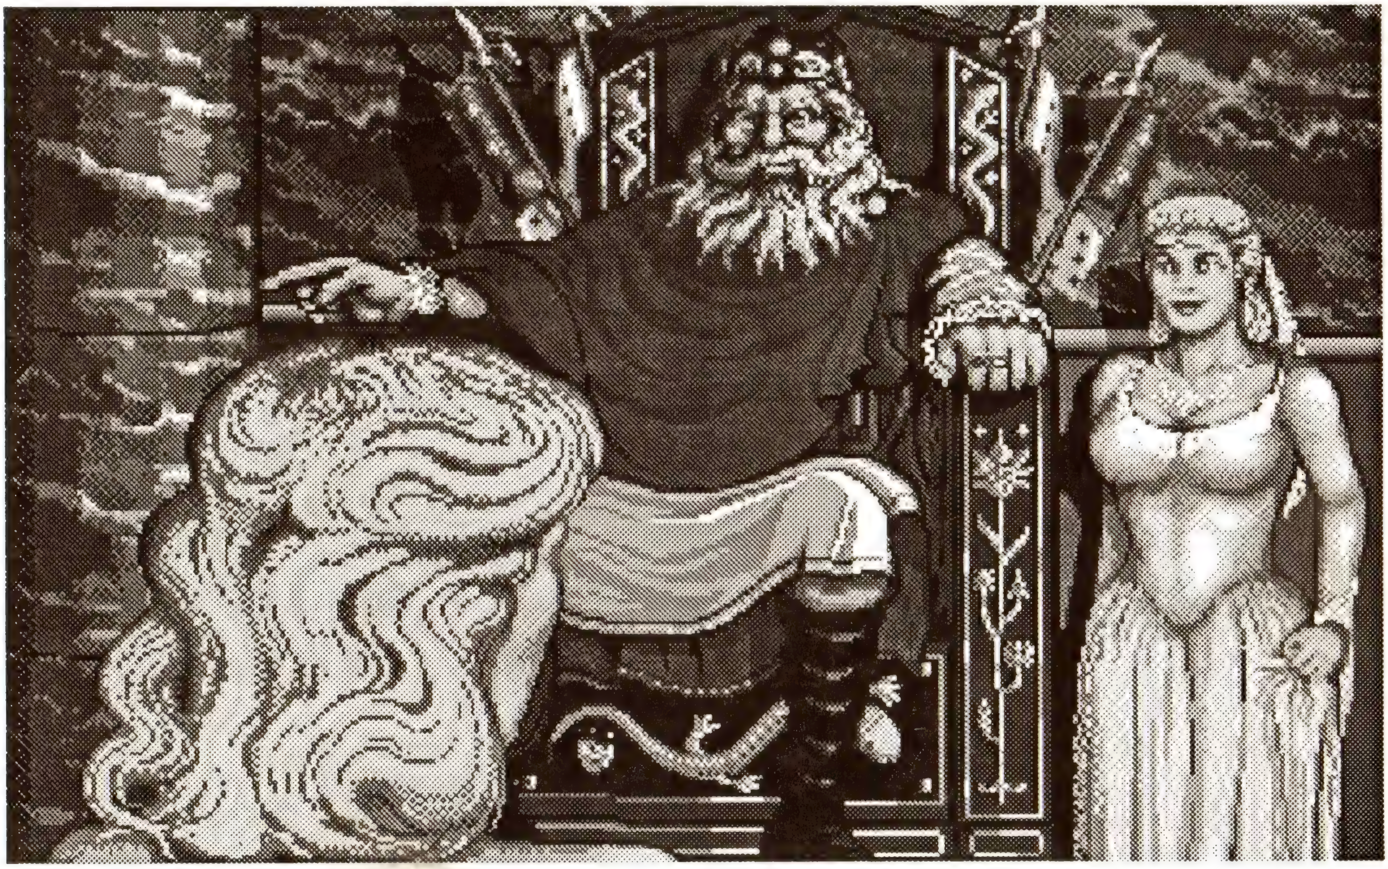
For all the gaming pros out there who keep up on the terminology, this is called "smooth parallax scrolling." Other games, like StarRay, have used this form of scrolling to great advantage, but Wrath of the Demon gets our vote for the best use of smooth parallax scrolling yet. Scenes like the one when fighting the goblins are perfect for this type of scrolling.

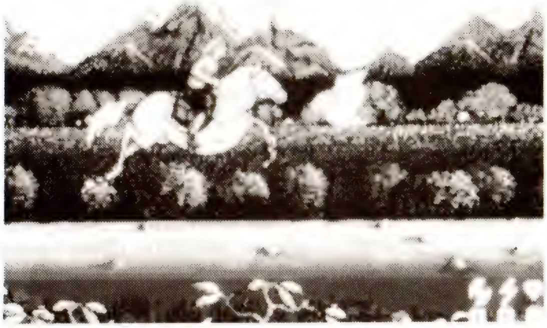
When battling the goblins in a forest clearing, clouds roll across the sky and in front of the moon, and the background scene actually seems to be alive with its own movement. The feeling you get is one of a real, living world that you're in, not a flat, dimensionless backdrop. This adds a tremendous amount of realism to the game.

Strategies

The type of strategy you use in Wrath of the Demon varies from level to level, as does the motion. You have to adapt to new and different situations. In this way, the game doesn't become "the same old thing" from scene to scene.

The first scene features a bit more "stunt" work—jumping obstacles and grabbing things from the ground while at full gallop. The second and third scenes are more the traditional "hack-n-slash," with a touch of karate. The underground cave scene requires a bit more thought and reflexes to get past bouncing nasties, spikes shooting up from the floor and other barriers.





General Notes

Wrath of the Demon was first released on the Amiga, and has since been ported to the ST, IBM, and Commodore 64/128 machines.

Whenever a game is ported from the Amiga to the ST, something almost always seems to get lost in the translation. Not with Wrath of the Demon. The team that ported the game to the ST—Ralf and Ulrich Doewich of CyberCube (makers of the CyReL color boards for the ST)—did an outstanding job on this game.

The 12-page manual that accompanies the game includes a two-page story to get you in the mood and a short list of game hints. The manual—and the outside of the game box—points out that single-sided drive owners will not be able to play as many scenes as double-sided drive owners.

Users who have two floppy drives can use both drives, bypassing some of the "Insert Next Disk" blues that usually accompany multiple disk games.

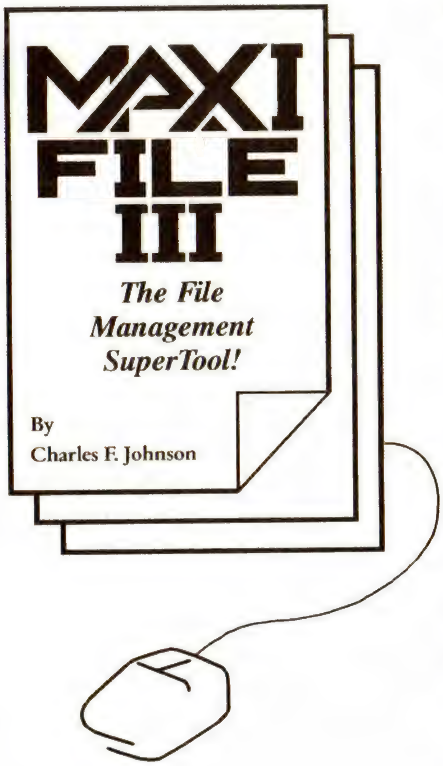
The Save Game feature of Wrath of the Demon lets you have more than one backup, so you can save the game at different locations. Later, you can go back and load any of these saved positions. One interesting thing about the save feature is that you don't need to format a disk prior to using it as a Save disk! Just stick the disk in the drive and Wrath of the Demon does its thing.

Thumbs Up!

This is a fun game—a little more than a "shoot-'em-up," but not as mind-bending as Dungeon Master. The game is challenging enough to keep your interest, but not so tough as to make you frustrated and put it on the shelf. The graphics are excellent and the music (nine different digitized sound tracks) compliments gameplay rather than distracts from it.

Wrath of the Demon is one of those games that has a little something for everyone, and it does everything well with no compromises. Whether you're into action games, arcade games, games with fighting/karate themes or hack-n-slash fantasies, Wrath of the Demon delivers something for fans of all these game types and more.

ReadySoft has a winner in Wrath of the Demon.



Nothing compares to MaxiFile III!

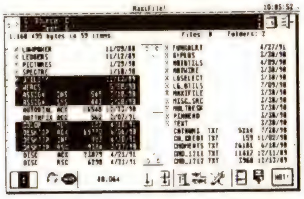
That's right – there's just no competition! **MaxiFile III** is far and away the most advanced file/disk management utility for the Atari ST and TT; nothing else even comes close!

MaxiFile III runs either as a GEM desk accessory or as a GEM program, so it's always available when you need it. You'll never have to exit a program just to copy, erase, move, or rename files or folders, or to format or duplicate a disk.

Our unique **Graphic Disk Info** display shows you the percentages of used and free space on all your disk drives, both numerically and with a bar chart.

Special **batch operations** let you rename groups of files, change date stamps, change file attributes, "fastload bits" and TT RAM flags, and even queue up a list of files to print – with just a few mouse clicks or keypresses!

If you've ever misplaced a file, you'll appreciate MaxiFile's powerful **search** function, which lets you search for multiple types of files by time/date, attributes, and more!



And if you've ever erased the wrong file by mistake, you'll *really* like our fast, safe **recoverable delete** function.

Perhaps best of all, MaxiFile III has special links with the other stellar programs in the CodeHead catalog, to increase its power by leaps and bounds.

See your favorite software dealer for a demonstration of MaxiFile III today. If you don't have a favorite software dealer, call us right away for more information.

Fixed Before It Was Broken! Thanx, Dave!

Mike Olin (WAUG)

I've always had a lot of respect for David Small, but recently he was elevated to the level of Grand Poobah Wizard of the Double-Sided Drive for repairing my disk drive problems before either one of us even knew anything was broken.

That Dave! What a Guy!

Here's what happened: recently, I was elected ST Disk Librarian of the Washtenaw Atari Users' Group in Ann Arbor, MI. I spent a great deal of time during my first month re-cataloging the contents of the library, something I'm sure every new librarian inevitably ends up doing.

After the re-cataloging, I managed to put together five new disks for the August meeting. Compiling the disks was simple enough, but then came the task of making saleable copies. Fortunately, the club had seen fit to allow me the use of a disk drive for this very purpose so I wouldn't have to put wear and tear on my own precious mechanism.

Using ProCopy I read from my drive and, with the multiple copy option, created three copies of each disk on the club drive. This worked beautifully, as you might expect. For about one minute...

Disk Blues

The first copy seemed to go OK. Then ProCopy prompted me to insert the next disk and hit <RETURN>. Hmmm. I thought I had closed the write protect tab on all the disks, yet ProCopy said the disk was write protected. But it wasn't!

Reinsert disk, hit <RETURN>. No go. Trying another disk, I got the same results.

However, I found that if I hit <RETURN> *twice* (before the drive light went out), ProCopy would "see" the disk as write-enabled and proceeded to produce the second disk. Same thing for the third copy. Far be it from me to argue with a disk drive at 1am. It worked and I had a lot more work to do.

Trouble!

Alas, all was *not* well. Although ProCopy *said* everything was fine, the disks turned out to be unreadable at the desktop. Opening a directory window caused a string of garbage to appear within it, and there was a 50-50 probability that the computer would lock up once this happened.

At this point, I assumed the club drive was probably in need of alignment or some such repair. So, out of expediency, I chose to go ahead and do the work using my own drive after all.

Square Electrons?

But now even my own drive would not write successfully! It seemed that just having the club drive plugged in, even though it was turned off, was a problem. Sorta like working with square electrons, or something. So I separated the club drive entirely from my computer and started all over again.

No go. My very own, never-had-a-problem drive wouldn't work with *any* version of ProCopy. Period. Zip. Nada. Out of desperation, I started tinkering with my AUTO folder programs and ACCs, but still no luck.

I switched off my ICD AdSpeed thinking it might be giving ProCopy a headache, but this didn't help either. (Note, ProCopy *does* have a problem with 16Mhz speedups, but that's another topic and not related to this story.)

Even More Trouble!

I even broke out my drive head cleaning disk hoping maybe this would help...and I switched to Double Click's DC-Format, grasping at straws.

Finally, I had some success. Disks displayed their contents properly at the desktop, and programs ran as I expected. Whew! I finished the job and went to bed, secure in the knowledge that I'd have good disks to sell at the club meeting (now barely more than 12 hours away).

Surprise! Most of my "good" disks would not work in the 1040 STe machine we were using at the meeting that night. Attempts to demonstrate the programs were met with sudden re-boots or total lockups. My poor computer was sick!

To the Rescue!

Fortunately for me, there is an Atari sales/service center within driving distance. (Atari being Atari these days, I know many of you probably won't believe this...but that's yet another story.)

After explaining the problem to the technician, he proceeded to run diagnostics on my ailing machine, forcing it to do all sorts of gymnastics. And, wouldn't you know, it passed with flying colors!

Atari's diagnostic cartridge said

there was nothing wrong! So, scratching my head, I went home pondering the possibility that square electrons really do exist.

Probably only in *my* house. You see, once I got the machine set up again, my drive would not write a legible disk that it could read from the desktop! Writing to a known good disk was instant death to the files already on it.

The Culprit Found!

Well, gang, it turns out that the Atari disk drive daisy chain isn't "terminated" all that well. Given the open and unterminated lines, it seems the drives and cables are subject to all sorts of interference and "ringback."

My monitor (Atari SM124) was sitting there pumping out "noise" just as fast as my disk drive could eat it, with or without the second drive plugged in. Due to space constraints, my monitor sits on a tilting base very close to the back of the computer. So why didn't I have trouble with this before now? I've had this desk arrangement for over 8 months.

Dave to the Rescue

Enter David Small. (Take a bow, Dave!) It seems Dave knows a lot more about noise and interference than Atari, and he managed to build line termination into the Spectre GCR cartridge.

Previously, I had kept my GCR plugged into my computer at all times. (Any light bulbs going on out there???) When I had installed the club's external drive, I had simply unplugged the cable from the GCR and used it to attach the drive. Goodbye line termination, hello line noise!

And, it just happened that the extra long cable which came with the GCR had coiled up under my monitor stand, which put it in even closer proximity to the monitor and made the entire system susceptible to interference. It was the feedback along this cable that caused my own internal drive to also act up.

By simply reconnecting the GCR to the drive cable, I had working internal *and* external drives!

Footnote

Here's a tip for anyone who might be having unexplainable problems with their disk drives—before you drive yourself crazy making trips to a repair center, try relocating your monitor further from your other components. Or, buy a Spectre GCR.

Another thing to take into account is that the Tramiels must be getting tired of shooting themselves in the foot every day and they're probably gonna shoot at yours sometime if you let them! So, buy a GCR anyway.

Thanx again, Dave!

A Dealer's View of AEGIS

Mike Drysdale

On August 5 & 6, Atari held its AEGIS Dealer Symposium at the Wyndham Gardens hotel in Sunnyvale, CA. Attending were about 23 dealers (one-third MIDI music dealers) and developers. (For a complete list of who was there, see Bob Brodie's posts on GEnie.)

This was an event of multiple opportunities—training of dealers in Atari hardware and software, exposure of computer stores to MIDI/music stores and vice versa, meeting Atari employees. All of this in a more intimate setting than trade shows like Comdex.

What really happened is Atari introduced its *AEGIS Strategic Partner* program for dealers and the Professional Systems Group. What this program does is create three levels of dealers/distributors.

1. Key or AEGIS dealers and distributors who will receive preferential shipping of high-end product (TT and MEGA/STe w/hard drive) and other merchandise.
2. Distributors and smaller dealers who will receive all product, including high-end when available.
3. Non-direct resellers of Atari who buy product from level 1 or 2 dealer/distributors.

The Professional Systems Group is the banner used to sell high-end products without having the well-recognized but often misunderstood name of Atari out front.

Let us acknowledge that Atari put this AEGIS meeting on at considerable expense. The hotel's conference area was set up with 10 tables, each containing a TT with 8MB RAM, hard drive and color monitor. At the front was a TT hooked up to a LCD overhead projector for demonstrations.

On the Agenda

The first day was a series of presentations covering the AEGIS program, Atari hardware and systems software, UNIX, retail and seminar selling, and detailed discussions with Atari sales and service reps.

During and following a dinner buffet was a product expo which allowed dealers and developers to get together one-on-one.

Day two, like day one, started at 8AM with a breakfast buffet, but we then split into two groups. Computer resellers stayed at the hotel for training on products from Lexicor, Soft-Logik, Gribnif, ISD and Goldleaf.

Meanwhile, the MIDI dealers went to Cogswell College in Cupertino to learn about Steinberg/Jones, Dr. T's, C-LAB, Roland and Hybrid Arts products. All training was performed by representatives from each developer.

I went to Cogswell to expand my knowledge of music software. Wow, I learned a lot. I came away feeling that MIDI software is more complex than DTP.

We regrouped at the hotel for a barbecue and more informal chatter.

One might imagine that if you gather a bunch of dealers and developers in the same room for two days with all the executives of Atari there would be a blood bath of complaints. Well, it just didn't happen. Everyone was enthusiastic about their business or product and Atari in general. We were all there to learn more (which we did) and improve our business (which we will).

The best part was all the freebies that were handed out—so much so, that I had to pack it all up in a cardboard carton and ship it home.

Hardware Hints

On the hardware front, it was revealed that the TT motherboard has been redesigned and resubmitted to the FCC. The new board is a multilayer design and will have a 1.44MB disk drive.

It will be easy to install a 1.44 drive on existing TTs and maybe even the MEGA/STe. Should be just the addition of a chip, drive and setting a DIP switch. The OS already knows how to format a 1.44 drive.

The TT LAN port is faster than a Mac's. The TT SCSI port follows the SCSI 1 standard, not the still being hashed out SCSI 2.

Curious fact about the new SLM605 laser printer—at 10,000 pages, it shuts down until a new drum is installed. So watch that counter!

UNIX Sytem V release 4 with Motif, X Windows, TCP/IP, NFS and RFS will be available later this year. As this represents 160MB of code, it is to be released on its own hard drive for the low <grin> price of $5000.

We did not see the PAD, STylus, Panther, Jaguar or any other rumored or imagined product. Any questions about these were met with a shrug, meaning, we can't say anything because either it's not done or we only talk about what's in the warehouse. Speaking of which, I took a sidetrip there on Wednesday. The warehouse manager was kind enough to let me walk around and take a few pictures. Much of the floorspace was devoted to LYNX product.

Selling Computers

As a dealer (and for you the user), the important aspect of this meeting was understanding how Atari plans to sell their products. At worst, I would call it a shot gun selling strategy —fire away and see what you hit. Or, more intellectually, Darwinian mutations hoping to fill every market niche.

Atari is selling product in two (or three) vastly different markets. One that we've all been familiar with for a long time for games (now entertainment products) is the mass merchandise outlets. In the past, these were places like K-Mart (to name the obvious) for the 2600 through XE, and recently Electronics Boutique and the like for the LYNX.

Second, we have the traditional computer store that probably carried all the above out of brand loyalty and today sells the ST/TT lines. These stores mostly sell to the home and small business user and provide support and service. This is part of the mass market, but with support.

New on the scene, as computers become a commodity, are warehouse outlets like PACE or CompUSA that only want to carry big name brand products. Atari, Commodore, Sun and others are not part of this market.

The other market is the one you rarely see—niche markets sold to by VARs. (Definition time: VAR stands for Value Added Reseller, sometimes known as an Integrator.) These companies usually sell a solution to a problem. The solution usually involves custom software written for a particular computer. The buyer typically does not care what the hardware is as long as it solves the problem.

Atari, although not well know by the average user, sells most of its computer products by way of this market. A few examples: the 8-bit continues to dominate the teleprompter market. Most TV, cable and closed circuit studios use an 8-bit with custom software. The VAR sells such a system for something like $3000.

The ST is used in custom installations for Point of Sale, embroidery, die cutting, air traffic control, education, digital recording and many others. These STs are sold as part of a system for prices ranging from $3000 to $70,000. As you can see, there is a great deal of money to be had in this type of selling. This is the market the AEGIS program addresses.

So, we can see that Atari is split. On the one hand, we have some great mass market products, past and present, which provide high visibility. And, we have high-end VAR products which provide fewer but more profitable sales.

The buyers of the VAR products are relatively unconcerned with the brand name, so the highly visible Atari "game image" has little effect on them. Unfortunately, market perception is a problem for sales into the home and small business market. These customers don't want to buy a computer from a toy manufacturer (until they see what it can do).

So Atari, with the AEGIS program, encourages resellers to work with software houses like Goldleaf to sell solutions, not computers. Here is the bottom line—your ST is not what you think it is. It is a niche market solution. You, as an ATARI owner, are in a niche market defined as "people who understand the computer they own and are willing to go against the grain for a more powerful, versatile computer at a lower cost."

A similar niche product is the BETA video tape format. It is still sold to TV studios because it provides a better picture than other formats. It is no longer a consumer product, just try to rent or buy a movie on BETA.

Unsolicited Editorial Opinions

I can only speculate what a great program we would have if all the programming hours that went into WordUp, Microsoft Write, WordFlair and First Word had gone into *one* GDOS-based document processor. I am underwhelmed by these products.

Aside to dealers who low-ball: raise your prices, you'll only lose those customers you can't support anyhow, but you'll make more money on each sale and you will be in business longer *making money.*

Customers, if you do buy from a low-baller, you're not allowed to later wail that there's no support for your Atari when the dealer you bought from goes out of business.

Lastly, I am tired of all the Atari backbiting and rumor mongering. If the same effort were being put into informing the world of Atari's great niche products we'd be too busy making too much money to bitch.

About the Author: Mike Drysdale, the owner of Team Computers, has been selling Atari products at retail since 1985.

USEFUL TEXTPRO MACROS

MICHAEL BENNETT

Here are descriptions of how to make some very useful macros for use with current versions of TextPro.

Macro #1: Screen Scroll

TextPro has several built-in editing features, but it does not have one for scrolling by screens. A macro can do the job easily. I defined my macro to do this using the equal sign key (or down arrow) for obvious reasons. Be sure, however, not to end the macro with a RETURN. Have another macro definition immediately after it.

Here's how to do it. Press ESC then CTRL-=. A downward pointing arrow should appear on the screen. Then press SELECT-= to begin the macro. Next press the ESC key and then the CTRL-=. The downward arrow should appear again. Do this until you have twenty-two of those arrows in a row. That ends the macro for a screen scroll. And remember to have another macro defined immediately after that twenty-second arrow.

The screen scroll macro is initiated by pressing OPTION-CTRL-=. It will move the cursor down twenty-two lines. If the cursor is at the top of the screen, it will move to the bottom without scrolling any lines. The next time you press OPTION-CTRL-=, the macro will scroll one screen, but keep the last line of the previous screen at the top of the new screen. This allows for continuity when reading from one screen to the next. I think you'll find this a better method than scrolling by lines or scrolling by paragraphs.

Macro #2: End-Of-File with Screen Off

In a long word processing session, do your eyes ever get blurry when you press CTRL-E to go to the end of the file?

Mine did, until I designed this macro to turn off the screen during the process. Here's how to design it.

Press ESC and then CTRL-E. A figure resembling a right angle should appear. Next press SELECT-= to begin the macro. Now press ESC and then SELECT-CTRL-X. This puts an inverse figure that looks like a perpendicular angle on the screen.

Next, press ESC and then CTRL-E. Finally, press ESC and then SELECT-CTRL-Z. As with the screen scroll macro, don't end this one with a RETURN. Have another macro defined after it.

When you press OPTION-E to use this macro, it will turn off the screen (SELECT-CTRL-X), do an end of file command (CTRL-E), and then turn the screen back on again (SELECT-CTRL-Z). It's a lot easier on the eyes and is a little faster than the normal CTRL-E command.

Macro #3: Blank Line Macros

This is actually two macros. Whenever I have to use blanks in text, I first put in dots (periods). And I always put the dots in in multiples of fours. For a short blank, four dots will do. For a longer blank, perhaps sixteen or even twenty-four dots might be necessary.

Once the document is completed, I use a replace macro to go to the top of the file and then go through the file replacing each set of four dots with four underline marks. Separate macros can be set up to put the dots in initially (I use OPTION-.).

However you get the dots into the document, here is how you can automatically replace them with blanks. I tied this macro to the 'c' key ('c' for change). First type the 'c' key, then SELECT-= to define the macro.

Next type SELECT-CTRL-X (turns off the screen). Now press ESC and then CTRL-H. Do this twice (same as two

CTRL-H's to get the cursor to the top of the file). Now press ESC and then CTRL-G (starts a global replace).

Next press the period key four times and press RETURN. Now press ESC and then SHIFT-- to get the underline symbol. Do this four times and press RETURN. These keystrokes do a global search and replace to change the dots to underlines.

Next press ESC and then CTRL-E to move the cursor to the end of the file and finally press SELECT-CTRL-Z. This will turn the screen back on. Do not end this macro with a RETURN or you'll get an extra RETURN symbol at the end of your file.

Writing about macros is not easy because each TP user has his or her own way of doing things. Users' needs vary, too. The three macros described in this article, however, should be useful to almost anyone who does a lot of word processing and editing using TextPro.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by

Daisy-Dot III for the 8-bit

Ellen Lentz (ACCT)

Daisy-Dot III is the third version of a printing program written by Roy Goldman.

The purpose of the program is to produce a typeset quality document, similar to NLQ (near letter quality), but with the added advantage of being able to use an unlimited number of public domain NLQ proportional fonts of many different sizes.

Daisy-Dot III controls all formatting, including word wraps, margins, page breaks, headers and footers. It also has many print formatting commands not found in some word processors, such as hanging indents, different types of tabs with dot leaders, controllable line-spacing, hard hyphens, hard spaces and the ability to switch fonts at any point in a document.

Daisy-Dot III prints text files that have been saved from any word processor that can save files "verbatim" from the text buffer and uses standard DOS format. If using Atari-Writer Plus, use Control-S (Save ASCII).

When creating your file, you do not use any of the word processor's formatting commands. Instead, you use Daisy-Dot III formatting commands, which are preceded by a backslash (\), and should be typed as normal text. Either upper or lower case is recognized.

There are two versions of Daisy-Dot III available. A distributable version is available on Compuserve or Genie which does not support SpartaDOS or multiple fonts.

A copyrighted version which does, and comes with an excellent 50-page printed manual and 50 new fonts, is available from Roy Goldman for $25. Daisy-Dot II fonts will work with Daisy-Dot III, but the new fonts will not work with Daisy-Dot II.

The Quick-Reference Guide is printed elsewhere in this issue based on the documentation supplied with both the distributable and copyrighted versions. It is applicable to both, except as noted above.

The page numbers are references to the printed manual. The Type indicates where the command can be used (\N is not legal on the first page of a file, for instance). The defaults, if applicable, are given in parentheses after the Function.

If you are using a printer other than an Epson-compatible, you should run the Basic program PPCUSTOM.BAS (supplied with DDIII) to select your printer. You should also change the Drive Number of the filename PP.COM (the Print Processor) if you are using something other than D:1.

The Print Processor is the file you run from DOS to process your document. The other functions can be specified in your text-file, so it is not necessary to change them here.

Spacing for margins and absolute/relative shifts is based on 40 to the inch across and 72 to the inch down. A left margin of 040 would be one inch from the left side of the paper, 060 would be 1-1/2 inch. A right margin of 040 would be one inch from the right side of the paper. A top and bottom margin of 072 would be one inch each. Headers and footers must be specified to fit within the margins. In other words, they must be less than the margins specified.

After customizing your Print Processor, you need only create your text file, save it to disk and run the print processor (PP.COM). (Load it from DOS or rename the PP.COM to AUTORUN.SYS and it will automatically load in.) You then specify the font you wish to print with and your text file-name, hit START and your document will automatically print.

To get the full benefit of Daisy-Dot III before spending a lot of time with it, Save to ASCII and print a previously prepared document. Daisy-Dot III will ignore the word processor commands, such as Block Right, etc., but this quick run will give you an idea of the print quality.

After PP.COM loads into memory, you can remove that disk from the drive. The program loads the initial font first, after the name is typed in, but reads the text file as it prints. If you have only one disk drive and wish to use multiple fonts, you must have the fonts and text file on the same disk. If using only the initial font, you can remove the font disk after it is read and put in your text file disk.

If you are using two drives, it is better to have font files in Drive 1, so you don't have to specify the disk drive in your text (Drive 1 and extention are assumed), and your text file in Drive 2.

Of course, if you're chaining text files, those chained files will have to be on the same disk. One nice feature is that you can see the names of the files on your disks (i.e., get a directory) before typing them in.

You should customize your Font Editor the same way as you did the Print Processor before using it. For the commands, the CTRL-key is used in conjunction with some of the characters instead of the backslash. One feature allows you to print all the characters of a font, so you can see what the entire font looks like. Some standard punctuation marks may be missing or may have been replaced with other symbols. The fonts so affected are indicated on the list of fonts supplied with the printed manual.

In addition to the Print Processor and Font Editor there is a Font Utilities program (FU.COM) which contains three sub-programs: Magnifier, which creates taller versions of fonts; Italicizer, which creates italic versions of fonts; and Converter, which converts Atari fonts to Daisy-Dot III formats with options for double-width and double-height.

The printed manual which comes with the copyrighted version gives a detailed explanation of all Daisy-Dot III features with numerous examples of formatting commands. It explains how to use SpartaDOS X and a RAMdisk. In addition to the Font Editor, it gives the formats of the Daisy-Dot fonts and ideas for additional font utility programs that could be written.

This is an excellent typesetting program. For the copyrighted version and manual, you can send a donation of $25 to Roy Goldman, 2440 South Jasmine, Denver, CO 80222. The program is well worth it.

Atari ST Owners!

Put Power into your cartridge port

Ultimate Ripper

$99.95

The cartridge your ST has been waiting for!

Breaks into any ST program • Fits easily into the cartridge port • Powerful Tool for all Atari ST users

Whether you are a programmer, hacker, gamesplayer, or just curious about the workings of your Atari ST, the Ultimate Ripper gives you the power that you need.

Just look at the features...

• Break into any program • Read Memory • Search Memory • Print Memory • Disassemble • Disassemble to disk • Edit Memory • Search for graphics • Search for Sprites • Edit screen Configurations • Set up colour paletts • Alter Plane configurations • Load and save Screen Displays • Run external TOS programs • Load TOS Programs • Load and Save graphics screens • Low Level Disk Editor • Disk Analyzer • Examine formats • Format analyzer • File Editor • Directory Editor • Formatter • Break & Restart function • Search forinfinite lives • Look for music • Play music • Load and save music • Search for soundtracker music • Search for Soundsamples • Programmers Calculator built in • Many more features • Updates available with new software • Full support for STE sound & graphics

Dealer inquirers welcome

THE FONT RESOURCE

Font Disk #23

Font Disk #23 from Computer Safari contains four fonts designed for specialty heads. These are "all caps" fonts.

The disk contains versions of each font for use with Calamus and PageStream, plus Adobe Type 1 versions are included for use with PageStream 2.1.

For purchasing information on the fonts showcased here, or for details on other font disks, contact Computer Safari, 606 W. Cross St., Woodland, CO 95695, pnone (916) 666-1813.

AIM Mac/Spectre Disk of the Month

Introducing the Atari Interface Mac/Spectre Disk of the Month!

Each disk is double-sided, formatted in Mac mode—Spectre format available on request. All files are self-extracting Compact-Pro Archives. Just double click to extract!

Disinfectant v2.51—This is the latest version of an excellent anti-viral application from Northwestern University. This program can scan files, folders, disks and hard disk partitions for a large number of Macintosh viruses. It includes an option to install an anti-virus init in your system folder. A very large help file is included within the program.

Spectre GCR 3 Keymap v2—This is a great desk accessory that lists all of the keyboard commands in Spectre v3.00. A very useful accessory.

Calendar (DA) v3.0.3—This desk accessory provides you with an excellent calendar. You can enter your own events for any day of the year.

SuperClock v3.9—The King of Macintosh time pieces. This init/cdev places a digital clock in the right hand corner of your menu bar. It works with everything and is very well behaved.

Init v3.0—This is an init management tool. It allows you to turn inits and cdevs on and off at bootup time. This is very helpful when trying to resolve init conflicts.

Monopoly v4.03a—This is the Macintosh version of Monopoly. You can play against the Mac by entering "Mac" as one of the players. The rules are included within the game.

Speedometer v2.51—This application tests your Macintosh's speed in various categories and then compares your machine to other Mac models.

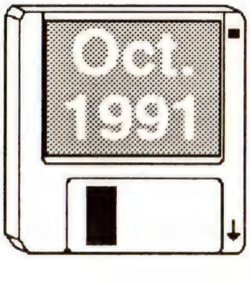
DOS Mounter Demo—This is a *demo* of a very useful init called DOSMounter. As the name implies, this utility allows you to mount DOS disks as if they were Mac disks. This can greatly simplify moving files from the ST side of your system to the Macintosh side. There are some restrictions in this demo (read the enclosed documentation) but it's still very usable.

Quill v2.02—This desk accessory allows you to read documents created by just about any Macintosh word processor. This version even allows you to view graphics that may be included within some Mac documents. This is a very useful desk accessory.

Glider v3.1.2—In this game you pilot your own paper airplane through rooms filled with obstacles and traps. Very additive!

Compact-Pro Package—This is a popular Macintosh file compression utility. All of the files on this disk were compacted using this application. (You don't need to use this application on the files on this disk. They are self-extracting.) This application will also extract files from Stuffit 1.5.1 archives.

Readers can purchase this disk by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the October Mac/Spectre '91 disk and Mac or Spectre format when ordering.



AIM
ST Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA!

To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the October '91 disk. For more complete docs, see the text files contained in most of these archives.

COSH22.APP—A full-featued MIDI sequencing program. Allows multi-voice recording using separate channels. Connect a MIDI instrument (such as a keyboard) to your ST's MIDI ports and use your ST as a recording/editing device.

DCLOFF.APP—DC Light OFF deselects the floppy drive, turning the drive's light and motor off. Very handy for hard drive owners who bootup without a floppy disk. 100% assembly. ST, STe and TT compatible.

DCMETER.APP—DC Mouse-ometer will let you know how far your mouse has travelled during your sessions on the computer. 100% assembly. ST, STe and TT compatible.

DEMOL13.APP—Demolition Man 1.3, a new version of the puzzle game by Clayton Walnum. The program now runs in both color and monochrome, squares can be marked with question marks as well as flags, and the game takes up less memory.

DIVERT2.APP—Version 2 of the Drive Diverter. Allows "floppy only" software to be used from hard disk. Many early programs were hard coded to use only the floppy disks. Now, you can use these programs on your hard drive! Even works with the desktop, allowing you to redefine any disk letter to any other (such as using Drive D:\ as Drive C:\). Shareware from England.

ELFBD11.APP—This is the latest revision of ELFBOOT, which now fully supports *all* TOS versions. Put ELFBOOT in your AUTO folder, and you'll be able to select desktop.inf files, choose programs to run, select desk accessories, select and/or re-order AUTO folder programs, select ASSIGN.SYS files, and fully control system colors and parameters. Best of all, it incorporates a GEM-like interface complete with mouse control, radio buttons, dialog boxes, and even a file select window! Shareware from Elfin Magic Software.

EXPAND.APP—Have any files on single-sided disks and you recently upgraded to a double-sided drive? Use this desk accessory from France to expand the disks to double-sided without bothering the original files. Works great!

HPDESK.APP—This program is an HP-Deskjet 500 printer utility. It supports many features such as horizontal and vertical printing, ASCII text or graphics printouts, configurable Dots Per Inch (DPI) and *much* more. German import, but the program and documentation is all in English.

MIDIKBRD.APP—This is a MIDI desk accessory that graphically displays a keyboard on the screen. When a key is pressed on the MIDI keyboard, the "key" on the screen lights up. Very nicely done.

NOIDS.APP—This is a great Breakout-type game. Color only.

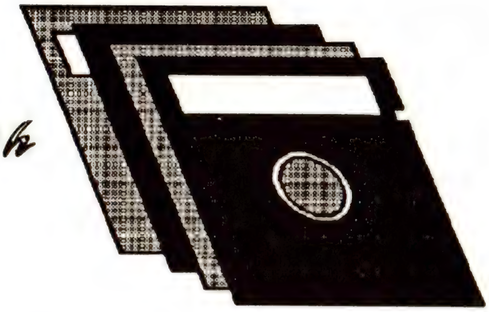
OMNI_101.APP—Omni 1.01 is a public domain, single-line version of a "soon to be released" multi-user, multi-tasking Bulletin Board System. This BBS has been in the making for over 10 months and is very easy to set up. Complete documentation enclosed. Full compatibility with *all* ST configurations!

POKRSQRS.APP—If you like solitaire and you enjoy poker, you're gonna love Poker Squared! Using the popular ZeST interface, this game will quickly become one of your favorites. Monochrome only. Freeware from David Becker.

REPEAT.APP—Desktop Repeat is a SIMON-like desk accessory game. Follow the sequence of colors and sounds. Low or medium resolution color. Freeware from David Becker.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the October '91 disk when ordering.

AIM 8-Bit Disk of the Month October 1991



Each AIM 8-bit Disk of the Month is a single-sided, single-density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility and to decompress files with a DCM extension, you need DISKCOM3.UTL (available from most BBSes, user groups or on the April/May '91 AIM 8-bit Disk).

Here's a short description of the files on the October '91 disk. For more complete documentation, see the text files contained within most of the ARChives.

Side 1

GOEDEMO.DCM—A full working demo disk-based version of GOE, the ill-fated Graphic Operating Environment cartridge that was never released by Total Control Systems. This demo disk, which was released in 1988, was sent to only a handful of people. Now, you can see what GOE could have been! Use DiskComm to extract. Plug a mouse into Port 1 or joystick into Port 2 to control the pointer on the screen. To view the GOE.DOC file on this disk, you must either have SpartaDOS or hit RESET **before** GOE.COM loads and then type TYPE GOE.DOC...or you could try to run your favorite word processor from within GOE!

NUMBERS.ARC—Three number games in BASIC, submitted by Ray Simmonds (MACE). NUMBERS.BAS contains a simple Number Guess game and two versions of Mastermind using numbers instead of colored pegs.

SPEDCALC.ARC—This ARChive contains a version of the popular SpeedCalc spreadsheet program that has been modified to have two keypad modes. First, it can use the Atari CX-85 keypad. Second, for users who don't have a CX-85, the keys on the right-hand side of the keyboard can be used as a keypad. Use SHIFT-CTRL-N to toggle the keyboard keys on/off. Documentation included. Submitted by Michael Bennett.

TPMACMB.ARC—An excellent TextPro macro system designed for teachers. This macro system has been updated for version 4.56XE of TextPro. The system contains eight different macros and 16 help screens. Macros in this system are perfect for creating letters and tests. A great package from Michael Bennett.

Side 2

DIRPRINT.ARC—BASIC program to print the directory of *any* SpartaDOS formatted disk, including hard drive partitions, MIOs and RAMdisks. Simple modification to the source allows you to print directories to a disk file. Must have SpartaDOS. Shareware.

LIBRARY.ARC—This program can be used to maintain records of a private or municipal library. Print an inventory, maintain a Dewey Decimal card catalog and keep track of book check-outs! Requires a 130XE or expanded 800XL and OSS BASIC XE cartridge. Run in Extended Mode. Complete documentation is included in the ARChive.

PICDEMO.ARC—Demo version of PicPrint, a commercial program from Kyle Dain. PicPrint can print your 8-bit graphics masterpieces in glorious full color (or B&W) on a number of printers.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the October '91 disk when ordering.

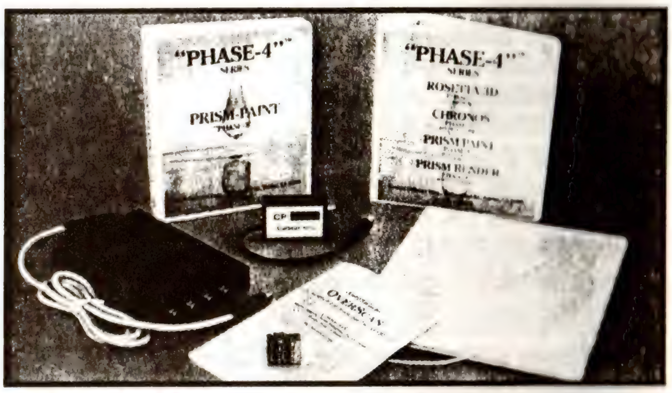
PHASE-4

Solid Object Motion Control and Animation System

- Opens a 4th dimension in which you actually cut, copy and paste time itself
- View 3D objects in the past, present or future from any point in space/time, simultaneously
- Do cyclic polymorphic transformations without point and face limitations
- Fully mouse and tablet driven programming with keyboard support totally eliminates program control codes
- Supports all ST and TT resolutions
- Outputs to P.I.X.A.R.'s Renderman RIB files



ROSETTA-3D
Translator/Viewer - $89.95

- ☐ Translate from one CAD, animation or rendering format into any other supported format
- ☐ Translation file size limited only by mass storage device - not memory size
- ☐ Translate entire folders using wildcards
- ☐ Import individual objects from within a file
- ☐ Quickly create and preview animations with simple "point-and-click" animation system
- ☐ High speed wireframe and depth-cue wireframe modes
- ☐ Amazingly fast depth-cue point cloud mode for real time playback of large objects
- ☐ Several solid polygon modes - uses revolutionary new polygon drawing algorithm for lightning fast display

SPECIAL PAK PRICES

Full Pak - $499.95	Animation Pak - $429.95
1. Rosetta-3D	1. Rosetta-3D
2. Chronos	2. Chronos
3. Prism Paint	3. Prism Render
4. Prism Render	4. System Utilities
5. Prism Tablet Driver	
6. Systen Utilities	

Broadcast Quality Genlock

Available In September - $399.95

CHRONOS
Key Frame Animator - $249.95

- ☐ Create stunning and complicated 3D animations without programming a single line of code
- ☐ Makes animation as simple as point-and-click... no complicated motion control language
- ☐ Point-and-click object, camera and light manipulation provides very inuitive user interface
- ☐ Spotlighting and shadow casting funtions built in
- ☐ Unique ability to cut, copy and paste motion for repeating complex motion sequences
- ☐ Data compatible with all Cyber™ series products

PRISM PAINT - $79.95

- ☐ Runs in all ATARI™ resolutions plus 1024X768 4096 color
- ☐ 24 bit true color mode with 16 million on screen colors
- ☐ All the standard paint program functions (circle, box, elipse, fill, cut, paste, copy, pixel editing etc.)
- ☐ Supports the Cal-Comp graphics tablet in four resolutions
- ☐ Create animations using the built-in slide show features

PRISM RENDER - $89.95

- ☐ Turns wire frame creations into "photographic" quality images
- ☐ Materials editor turns rendered surface into wood, chrome etc.

SYSTEM UTILITIES - $49.95
TABLET DRIVER ALONE - $49.95
PRISM TABLET w/driver - $224.95

NTSC Encoders - Convert RGB to Composite Video

Now you can output your art or animations to any TV or VCR or Genlock

CP-ATARI ~ $99.95

~ATARI 13 Pin DIN input with Composite Video out on a standard RCA connector

CP-10 PROFESSIONAL (Broadcast Quality Output) ~ $249.95

~Standard SCART connector input with free cable to connect to ATARI 13 Pin DIN monitor port
~Seperate output of Luninance, Chrominance, Composite Video and Audio on standard RCA jacks

OVERSCAN

~More pixels on any monitor

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, from 6:30 to 9:30 PM. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Library of about 700 disk titles. Each month we publish (FR)ANTIC covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

AACE

ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

President Richard M. Houser (505) 299-3977

General membership AACE members meet twice monthly, on the first Saturday and third Tuesday of each month. An 8bit meeting is held on the second Tuesday of each month. On the first Saturday of June and December, a Swap Meet is held. Dues are $20 a year payable in January. Members receive an AIM subscription, access to our 16bit and 8bit PD library and membership in the ASTRO BBS (505) 260-0448 Club membership is at an all-time high of 36.

The Atari Clubs of Denver is an umbrella group consisting of: Atari Club of Denver, Starfleet User Group and the ST Interest Group. Atari Club of Denver meets the first Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7:00 PM. Starfleet User Group meets the second Friday of each month. We meet at Pamona High School 8101 West Pamona Drive in Arvada, Colorado. The meeting starts at 7:00 PM.

Atari Club and Starfleet provide support for Atari 8-bit owners.

ST Interest Group meets the third Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7PM. The ST Interest Group provides support for the entire ST computer line.

Our address is: Atari Clubs of Denver POBox 24064 Denver, CO 80224. For additional information call our BBS at (303) 343-2956, 24 hours, 300-2400 BPS.

ACCEPT

Atari Computer Club of El Paso, Texas

Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT, 245 Longhorn Crt, El Paso, TX 79907.

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCESS

Atari Computer Club Encompassing Suburban Sacramento

Bob Drews (916) 423-1573 President

ACCESS — The Atari Computer Club Encompassing Suburban Sacramento. As usual, please call any officer if you need information, directions or even to make a suggestion. Or, you can call the ACCESS BBS at (916) 428-8662. Address: PO Box 1354, Sacramento, CA 95812

Our general meeting is at 7:30 PM on the first Wednesday of each month in Classroom B of the SMUD training building at 1708 59th St, between Folsom Blvd and R Street, just off Highway 50. This is our main get-together.

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, 1150 Winton Road South. An ST Beginner's class starts at 6:45, while our 8-bit 'Basically Speaking' class starts at 7:00. Our general meeting starts at 7:30pm in room 262S, with a split into ST and 8-bit SIGs at 9pm.

We operate the Dimension's End BBS at (716)436-3078, 300/1200/2400 baud, 40 MB of online PD and shareware files. Membership in ACORN is not required to access the system.

Membership in ACORN is $18 per year, and entitles you to a year's subscription to both the ACORN Kernel newsletter and the Atari Interface Magazine, 12 meetings, access to our 8-bit and ST PD libraries at reduced cost, and special access to our BBS. Our mailing address is: PO Box 23676, Rochester, NY 14692-0676.

President	Don Allis	(716)293-3415

ACUNET
Atari Computer Users Network
Salem, Oregon

ACUNet is the Atari Computer Users Network in Salem, Oregon. Annual dues are $15 with an AIM subscription and $10 without. Our meetings are held the fourth Tuesday of the month at 7:00 p.m. Call Ron Purdy, ST Co-Chair at (503) 588-7509 for the current meeting location and other information.

Local BBS support includes the Atari SIG on the Salem Public Library BBS - (503) 588-6130, Page BBS - (503) 363-0171, and The Jungle BBS - (503) 393-4274. Want more information about ACUNet? Write to Ron Purdy, 2662 East Nob Hill Drive SE, Salem, OR 97302.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President	Phil Rominger

ACE of St. Louis, PO Box 3508, St. Louis, MO 63143, phone (314) 644-7168.

President	**Dick Pederson**

B.a.a.U.G.

Bay Area Atari Users Group, PO Box 4637, Santa Clara, CA 95054

BBS:	(408) 986-0215
Robert Kaczanowski	President

Birmingham Atari Computer Enthusiasts

Vice President	Todd Price	(205) 787-8208

Club dues are $15 for regular and $25 for advanced. Advanced includes an AIM monthly disk, specify ST or 8bit. BACE meets the second Monday of every month at 7pm in the Vestavia Hills Public Library, downstairs.

WAUG

Windsor Atari Users' Group

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'.

President	Brian Cassidy	(519) 966 0305

WNY UG

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

President	Mike Husband	(716) 825-8486
The Wizard's Attic BBS		681-1654

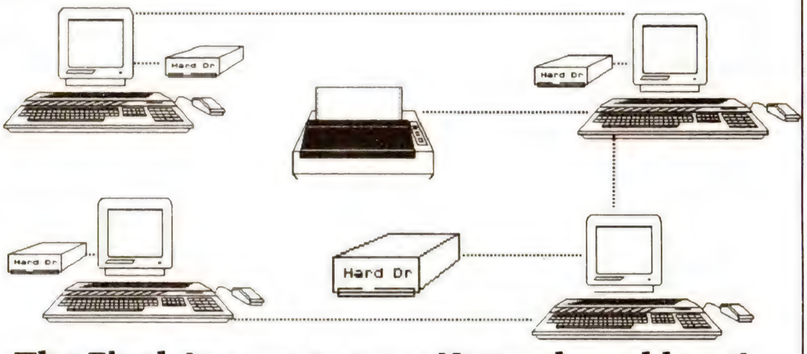
$24.95

Share hard drives, printers, and communicate easily between computers with the new Universal NETwork. Powerful, Easy to use, Flexible, Compatible and multi-tasking. Works with LANtech, SGSnet or our own MIDInet hardware. Same software usable by all devices, intermixed or not.



The Final Answer to your Network problems!

Universal NETwork software is extremely compatible and includes LANtech, SGSnet and MIDInet drivers. Compatible with all ST TOS versions. Universal NETwork can multi-task between network nodes, while you carry on foreground tasks at the same time. Use one or more hard drives in the network. Use a remote printer. MIDInet devices from A&D use standard 4-wire modular phone plugs and wire.

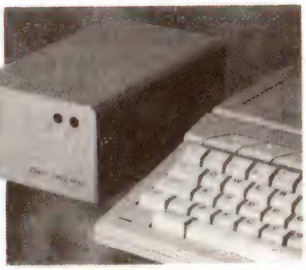
POWER COMPUTING

NEW SERIES 900 HARD DISK



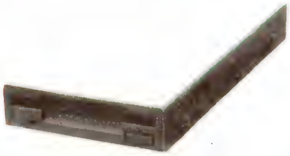
- Super slim metal case
- Low profile mechanism
- No need for a cooling fan
- Buffered thru'port
- Optional battery backed up clock
- High speed 20mS seek rate
- Write protect switch, protect your valuable data

40MB	$ 579
40MB with clock	$ 599
100MB	$ 879
100MB with clock	$ 899

BLITZ TURBO

- The original Blitz (beware of imitations)
- Complete with lead, software and on disk instructions
- Back-up your disk at lightning speed
- Copies from the internal to the external drive
- Cleverly by-passes your ST's disk controller chip
- Back-up an ST disk in around 40 seconds $29.95

PC720E POWER DRIVE



- 3.5" External floppy drive
- Slimline metal case it takes its power from the joystick port $99.00

INTERNAL FLOPPY DRIVE

- Replacement 1MB internal drive
- High quality mechanism $79.95

OFFICIAL INTERNAL DRIVE

- No case cutting, but must be small button. $ 99.00

SLIMLINE HARD DISK

- Tiny hard drive — 23cmx3cm
- Whisper quiet mechanism with no need for a fan
- Complete with PSU
- Complete ICD interface & utilities

40MB	$ 499
100MB	$ 779

ULTIMATE RIPPER

- Breaks into any ST program.
- Fits easily into the cartridge port
- Powerful Tool for all Atari ST users $ 99.95

ST RAM EXPANSION

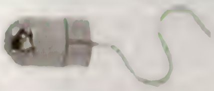
- No soldering required
- Uses latest high capacity RAM chips
- Expand to 2MB or 4MB
- Plugs directly inside the ST
- Full fitting instructions included

New 512K RAM Expansion for all STFM machines	$ 119
2MB RAM Expansion	$ 199
4MB RAM Expansion	$ 299

ATARI DATA SCANNER

- High quality hand scanner
- Complete with scanning & touchup software $339.95

POWERMOUSE



- Top quality mouse with smooth Naksha mechanism
- Microswitch buttons for precision use $38

PRO SOUND DESIGNER

- Tried & tested ST sound sampler
- Samples from 3-28KHz
- Many software features mono & Colour $75

QUANTUM PAINT

- Superb 4096 colour paint package
- From 128 to 4096 colours on screen at once
- Many software functions
- Handles all popular file formats $28.95

CAMPUS DRAFT

- Excellent entry level CAD package
- Works on all mono Atari ST machines
- Large range of professional CAD features $49.95

Want to get the most from your Atari investment?

Subscribe to *Atari Explorer*, the Official Atari Journal! Each issue of *Atari Explorer* is filled with reviews, tutorials, hints, and late-breaking news to help you keep pace with the fast-changing world of Atari products! And *Explorer* is the only Atari magazine that covers the full range of Atari equipment — from the exciting ST and TT computers, to the 8-bit home computers, to the amazing Portfolio palmtop MS/DOS computer and the Lynx Portable Entertainment System — so whatever Atari you own, you'll always find something new, relevant, and exciting in our pages!

Six issues of *Atari Explorer* are only $14.95 — a savings of 15% off newsstand price! That's a small investment that pays BIG dividends, when it comes to getting the most from your Atari! So what are you waiting for? Subscribe today, and plug into the most useful Atari peripheral money can buy: *Atari Explorer Magazine*!

Yes! Enter my subscription to *Atari Explorer* at the money-saving rate I checked below.

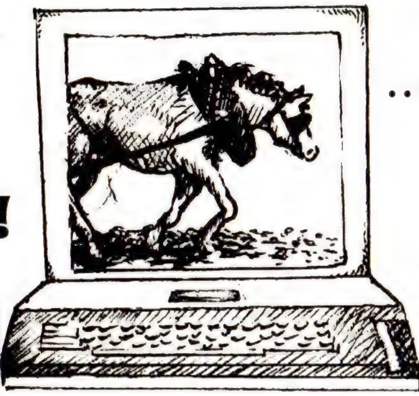
ATARI®
EXPLORER

Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

Power Products for your 1050 drive

$69.95 THE SUPER ARCHIVER $69.95

The Super Archiver is more than just another double density high speed upgrade for your 1050 drive. Rather it is the most powerful **copying and disk editing** 8-bit tool available! Copies are **exact duplicates** of the originals: no patches or PDB files needed. Installation consists of a plug-in module and six simple solder connections. Software included. Only $69.95 + $5 S/H/I. Features include:

- TRUE DOUBLE DENSITY
- ULTRA SPEED read/write
- FULLY AUTOMATIC COPYING
- EXTRA MEMORY SUPPORT
- SCREEN DUMP to printer
- HEX/DECIMAL DISPLAY
- SECTOR or TRACK TRACING
- DISPLAYS HIDDEN PROTECTION
- AUTOMATIC/PROGRAMMABLE
- PHANTOM SECTOR MAKER
- ARCHIVER/HAPPY ARCHIVER COMPATIBLE
- BUILT-IN EDITOR reads/writes/formats up to 35 sectors/track
- CUSTOM FORMAT tracks up to 40 sectors
- BUILT-IN DISASSEMBLER
- TRACK MAPPER displays up to 42 sectors
- ADJUSTABLE/CUSTOM SKEWING
- AUTOMATIC SPEED COMPENSATION

$99.95 THE SUPER ARCHIVER II $99.95

The **SUPER ARCHIVER II** edits and copies all **ENHANCED DENSITY** programs plus retains all the features of our **SUPER ARCHIVER!** (see above.) This allows you to **COPY** or **CREATE** single or ENHANCED DENSITY protection schemes (including **PHANTOM SECTORS!**). Completely automatic and compatible with the **SUPER ARCHIVER I**; a truly **POWERFUL BACKUP/PROGRAMMING** device! Only $99.95 + $5 S/H/I. ***NOTICE!*** If you already own a **SUPER ARCHIVER**, you can upgrade to a ***SUPER ARCHIVER II*** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$79.95 THE BIT-WRITER $79.95

The Super Archiver **BIT-WRITER** is capable of duplicating the 'uncopyable' EA and SYN series which employ 34 FULL sectors/track. It performs its feat by re-assembling the track into bits, then writing it all back out. Simple installation: **PLUG-IN** circuit board and four solder connections. The **SUPER ARCHIVER** with the **BIT-WRITER** is the ultimate backup tool for the 1050 drive. **EXACT DUPLICATES** of originals are made. Must be used with the **SUPER ARCHIVER**. Only $79.95 plus $5 S/H/I.

>> FALL SPECIAL! << Order the ***SUPER ARCHIVER*** and ***BIT-WRITER*** combination for only **$149.95** plus $5 S/H/I!

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

***>> Fall special** price - **$59.95**! <<*

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money, send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

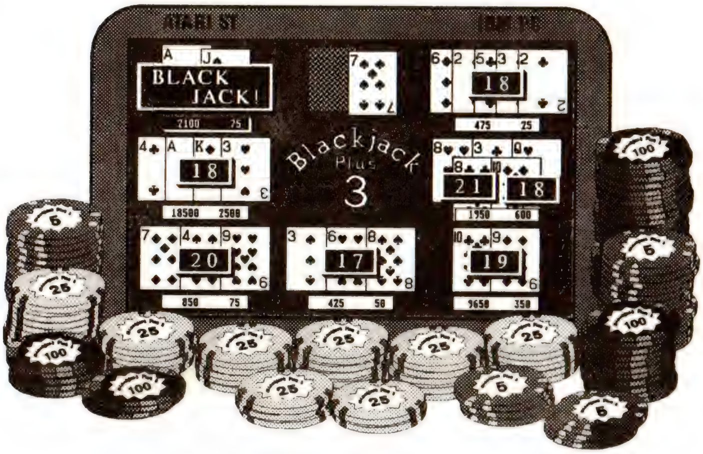
ARE YOU READY TO PLAY

BLACKJACK ?

LEARN TO WIN WITH BLACKJACK PLUS 3



All aspects of playing, learning and evaluating casino blackjack combined into one easy to use program!

BLACKJACK PLUS 3 will get you exactly where you want to be, whether you want to learn basic startegy or master advanced systems from the pros like Canfield, Revere, Thorp, Uston, etc. Learn and enhance existing strategies or develop your own.

Play 1 to 7 players, each set to play manually or one of the three optional modes: Feedback, Automatic and Background.

Programmable playing, betting and counting strategies (including exact counts, side counts, insurance thresholds, etc). Up to seven strategies (a different one for each player).

Accurate simulation: insurance, double down, split, surrender, double down after split, realistic random card distribution.

Extended statistics and play log.

Options: 1 to 9 decks, adjustable dealing depth, selectable casino rules, hand totals and card counting optionally displayed, operate with mouse, joystick or keyboard.

Let BLACKJACK PLUS 3 show you how to win!

More Features! More Realistic! More Fun!

IBM PC/XT/AT/PS2 & Compatibles EGA/VGA
ATARI ST Color & Monochrome

Blackjack Plus 3

BLACKJACK PLUS 3 **$49.95**

BLACKJACK PLUS 3 BASIC **ONLY $23.95**

(Preset single & multi deck basic strategies, no log or save setup features)

MASTER YOUR K4, K1, TX81Z

This critically acclaimed program will give you complete control of your instrument and allow you to create new sounds easier than ever before! The Voice Development System inludes an integrated editor, librarian, sequencer and intelligent patch creator. These programs were designed exclusively for the instruments they support and are the very best available. Extra banks of sounds are shipped with each product! These excellent products are now available at incredibly low prices only when you buy directly from Musicode.

FEATURE ARTICLES

Right On Target 8
David Plotkin, contributing editor, gives us his impression of the recent Glendale show and how a shake up in the Amiga market could affect Atarians.

Eight Bits of Atari History, Part 2 10
Ed Hall (AAAUA) gives us another installment of the beginning history of the personal computer.

The 1991 Glendale Show 13
SVACE's Gary Klugman reports, complete with photos, on the Southern California Atari Computer Faire held in Glendale recently.

EdHak 2.24 17
Editor Bill Rayl gives us a long-overdue review of the excellent and flexible text/sector editor from Clear Thinking.

Sex, Lies and Graphic/Video 20
Contributing Editor Jay Craswell continues his column by detailing more about scalable fonts, screen DPI and VGA.

So You Want to Start a User Group? Part III 23
The tutorial on starting and running an Atari User Group continues from Tim Holt, Contributing Editor.

What Does the Future Hold for the Atari 8Bit User? 26
MAUG's Chuck Steinman, also president of DataQue Software, tells us about two new 8bit hardware systems he plans to produce—the 1600XLE and the 130XEC

Ultimate Ripper 33
Power Computing's powerful and useful new cartridge is reviewed by Editor Bill Rayl.

The XEP-80 and 9600 Baud 36
John Tally (WNYAUG) shows us how he used SpartaDOS and BobTerm with his 80-column board for the 8bit to connect to BBSes at 9600 baud.

Adventures in Structured Programming 38
Michael Stomp talks about the meaning of random numbers, their use and function in programming. Detailed article for the advanced user.

Boxes 43
ACCEPT's Tim Holt talks about, of all things, the differences in the packaging between the Mac and the Mega/STE systems and asks you to draw your own conclusions about what that means in the marketplace.

TextPro+ Tutorial for the 8bit 47
Ellen Lentz (ACCT) details using the Shareware Classic Atari word processor from Ronnie Riche.

ATARI INTERFACE

Your Connection to the Atari Users Community

Publishers
Bill Rayl / Patricia Snyder-Rayl

Managing Editor — Patricia Snyder-Rayl
Editor — Bill Rayl
Contributing Editors
Dave Plotkin, Jay Craswell, Tim Holt

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

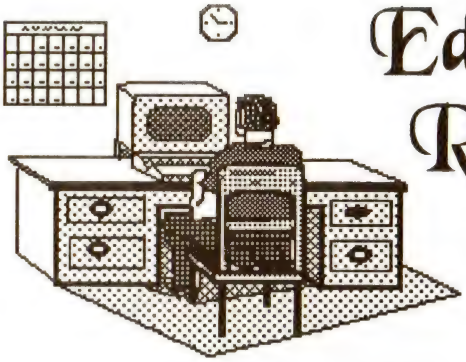
Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.



Editorial Ramblings

HOPEFULLY, EVERYONE WHO wanted to got a chance to talk with us at the WAACE show. We're typing this before the show, so forgive us for trying to forecast the future!

This issue contains a report on the recent Glendale show from SVACE President Gary Klugman. Next issue will have a report of the WAACE show. If all goes well with the mail, you should be reading this a week or so after the show finished.

This will be our second appearance at WAACE. We attended the 1989 WAACE show, the last held in a local high school and free to the public. We did very well there, mostly introducing ourselves to Atarians in the DC area.

The last show of the year we plan to attend will be the Chicago ComputerFest by Atari at the O'Hare Ramada in late November. That will bring us right into the holiday season. Boy, did this year go by fast!

Speaking of year's end, many of our participating clubs are coming up for renewal of their ST disk and magazine subscriptions. We'd like to inform or remind the clubs that the cost for the ST disk subscription has gone up this year. Any club officer who has questions should please call us at (313) 973-8825.

If your club renewed at the old rate a few months ago, the subscription at the old price will be honored, since the club got its funds in before "official" notification. The price increase is due to professional duplication costs and use of diskette mailers, which translates into higher mailing costs.

Finally, we'd like to thank all the people who've sent back survey forms. They've been interesting reading for us! If you haven't sent you form back, please do so. This way we're sure to know what your needs and likes/dislikes are.

Bill & Pattie Rayl

From The Reader's Viewpoint

Dear Editors,

I enclose my check for $12 for the September 8bit and ST Disks of the Month. I am enjoying the previous 8bit disks, and just finished transferring several dozen Degas pictures (some converted from Spectrum 512) to the 8bit using the ST Xformer for use with the DEGASRD.OBJ program.

STart/ANTIC owes me for my 8bit game GEMINI from the Feb/March 1991 issue. But, like David Plotkin, I only hope the future holds something positive for us all.

ANTIC and many other magazine gave us an awful lot for our money for almost 10 years. Now, we're in the age of DTP, and magazines like yours and Current Notes (for which I do the "Small Miracles" column) and ST Informer and AtariUser fill our needs very well.

I especially like the fact that you have some "type-in" features. I personally would like to see a regular column on programming in ACTION! Not necessarily whole programs, but some useful subroutines.

I look forward to your features on PageStream, since I just recently received the 2.1 upgrade.

I use both XE and STE quite a bit. I do not plan to stop using either one for a long, long time! I also find that PC Ditto (the software version) gives me more IBM compatibility than I want or need.

Thanks again for the swell magazine which seems to be getting a little better each issue.

I understand some people are on your case for irregularities of delivery, etc. Get the magazine out, and I will patiently wait while you do your best. Better to be late than to turn out something useless which satisfies no one.

The Atari market is in bad shape right now, and has nowhere to go but up. I refuse to engage in "gloom & doom" activities. I don't see the value in analyzing every detail and wondering why this or that doesn't work or isn't being done.

Mass markets always want the comfort of a handy Radio Shack store or Sears computer department where they can go and ask questions, even if they leave livid with rage because no one can answer their questions or solve their problems.

When I play Lemmings, I always think of them as the ignorant masses of potential computer buyers whom I lead to the golden arches of Atari!

Continued best wishes and good luck!

Sincerely yours,
Frank Kweder

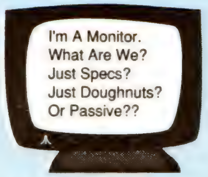
TOADAL ECLIPSE.



I'm A Monitor.
What Are We?
Just Specs?
Just Doughnuts?
Or Passive??

HANDY TIP

When looking for a multisync monitor for your ST, make sure the low end horizontal sync is no more than 15.75 KHz. Color resolutions will not work otherwise.

MONITORS & FRIENDS

Everybody needs a monitor. Sometimes they even need two. When they do, **TOADSWITCH** and **TOADSWITCH-M** come to the rescue! Order your **TOADSWITCH** *toaday!*

Atari SM124 Monochrome	$159
Atari SC1435 14" Stereo Color	$329
Magnavox 1CM135 14" Stereo Color	$319
Acer 7015 ST/TT Color/Mono Multisync	$409
Atari PTC1426 Color TT Monitor	$479
Atari TTM195 19" Monochrome	$959
TOADSWITCH ST Monitor Switcher	**$39**
TOADSWITCH-M ST Multisync Controller	**$59**

A Monitor Switchbox, a Multisync Controller AND Seismograph? WOW!

The **TOADSWITCH** and **TOADSWITCH-M** are handy switches which will switch between monochrome and color on the ST. The **TOADSWITCH** is for two standard ST monitors. The **TOADSWITCH-M** is designed for switching between color and monochrome on a single multisync monitor, but will switch two ST monitors also.

New Catalog is OUT!

We recently finished our new catalog. It's thirty-six pages jam-packed with stuff you just gotta have — with explanations and articles about everything. If you are on our mailing list, you have probably received one. If you've not received one, please give us a call and we'll send you one pronto. Includes everything from accelerators to Z-RAMs. Call **toaday** and get yours!

It STopped Breathing?

If your ST has just stopped breathing, give it two puffs followed by five chest compressions and then send it to us. Some days we just wait around for ST's to kick the bucket - just so we can go and fix 'em. Don't hate us because we're morbid, though. Send us your ST before real brain damage takes place. Include a note listing symptoms of death, and try to call us before you send it.

We Buy Eight Bits!!!

The response to our recent campaign to resell used eight bit equipment has been impressive, and we've moved a lot of stuff. If you've got some eight bit stuff you'd like to sell, send us a list of what you have, and let us know whether you're looking for cash or credit in exchange for it. We'll get back to you with what we can do for you! It's that easy! Call for our catalog!

Pagestream 2.1! Now!

Pagestream, the standard for Postscript desktop publishing on the Atari has a new version - 2.1. They're not foolin' around - this time they have included support for Adobe Type 1 fonts, Compugraphic Intellifonts, and Pagestream standard fonts, too. Postscript fonts can be printed to non-Postscript printers, too! Order yours TOADAY! Only $179.95 introductory offer!

David Plotkin
Contributing Editor

Why not sell a desktop publishing solution—a box with Atari insides, software and a laser printer—that doesn't say Atari on it anywhere?

Random Access

I just got back from the Glendale Atari show, and while I won't describe it for you (my friend Gary Klugman has done an able job of that elsewhere), I *was* surprised by the upbeat attitude of the show. People were having a good time, vendors were selling out of their products and, in general, virtually everyone was smiling.

I don't know whether it was just that there was no World of Atari Show this year, or that Atari is finally getting ready to do something serious with the TT and the Notebook, but it was great.

I think I mentioned in a past column that what really gets me to continue to go to Atari shows is the people. I renewed my acquaintance with Mike Schuetz, an editor of Atari Journal, a German ST magazine, and I met Michelle (ATARI-OZ) from Atari Australia. Both of these folks are absolutely delightful, and it was experiences like these that made it going worthwhile. Even Dave Small was smiling (as he proclaimed Atari is a corpse *ouch*).

I even sat down for a long talk with Nathan Potechin from ISD (Calamus and DynaCADD), who told me of some exciting developments to come on those products. Nathan is a wonderful guy, very competent, and very dedicated to the Atari market.

He is the president of the IAAD (Independent Association of Atari Developers). He told me he was pleased that I had remained interested in Atari after STart folded up. And you know what? I am pleased that guys like Nathan care enough to notice. Kind of helps make it worthwhile.

A few issues back, I described the advantages of true multitasking and wondered if MultiGEM (from RIMIK Enterprises) might just fill the bill. I had a chance to work with MultiGEM fairly extensively this weekend, and am happy to report that, in large part, it works well. It allows you to load programs into the Desk Accessory slots under the DESK menu—so you are limited to six programs running at the same time.

But, since you are talking about a 68000 processor that isn't real good at keeping a lot of balls in the air at once anyway, I don't see that this is a problem. If you need accessories, of course, this reduces the number of programs you can run concurrently. Rich Betson of RIMIK recommends MultiDesk (from CodeHead Software) to get around that problem.

From what I could see, except for a few MIDI programs that do some totally illegal things to the operating system, multi-tasking has come to the ST. Check it out.

Another development is some new products from the CodeHeads. Yes, I know, a few issues back I said that they weren't going to do any more products for the ST. Charles and John (the CodeHeads) swear they brought out the new products just to make a liar out of ol' Dave.

At any rate, the amazing one is a vector graphics package that can translate from standard paint package formats to vector graphic files—and edit the results. It's pricey, but very powerful.

Selling Solutions

There is a controversy brewing in the Amiga world that I think has some bearing for Atari users. As you are probably aware, the Amiga has not been selling very well, for many of the same reasons that Atari computers have not taken the world by storm.

Image seems to be the main problem—the Amiga is not perceived as a capable computer, although it *is*. Commodore has continue to upgrade the machine through the various chips in the 680x0 line—culminating with the A3000, running a 68030 chip at very high speeds. But people still won't buy them.

Recently, Newtek came out with a device, named (strangely) the "Video Toaster." This box enables the Amiga computer to produce extraordinarily high quality video effects. It allows professional studios to provide results that are quick, inexpensive and stunning. The problem, of course, is that the Video Toaster requires an Amiga to run.

Now, granted, some professionals have realized the power of the Amiga and purchased them despite the "stigma," but many have not. Yet, these are the very people who are interested in what the Video Toaster can do. So, what Newtek has done is package the Amiga with a Video Toaster in one case (actually, an Amiga case) and cover the Amiga nameplate with their own.

People are buying the silly things in droves, because Newtek has a reputation for quality products. In fact, Newtek even went so far as to show a version that connected to a Mac at the MacFest in San Francisco. The only thing different was that you could use the Mac keyboard and mouse to drive the Amiga. Pretty clever, huh?

I wonder if Atari couldn't learn a lesson here. Atari computers are really great for things like inexpensive desktop publishing. The problem is that people don't buy Ataris for "serious" work. Why not sell a desktop publishing solution—a box with Atari insides, software and a laser printer —that doesn't say Atari on it anywhere? Think it's far out? In Germany, Ditek (makers of the Calamus DTP package) is marketing something they call the "Calamus Tower" which is exactly that. The computer itself is an Atari computer, but they repackage the parts into another case with the Calamus label. I understand they are doing quite well with it.

And they aren't the only ones. 3K Computerbild has a similar setup. One of the ways this kind of thing can actually hurt Atari is that it doesn't promote the Atari name the way stock Atari computers do. Nevertheless, if it sells boxes, I would say it is worth it. With the advent of the 68030 accelerator boards, these boxes can be very fast, too.

See you next month.

Eight Bits of Atari History, Part 2 or The Way It Might Have Been

Ed Hall (AAAUA)

This month's installment brings IBM into the home computer picture.

IBM Buys Atari!

Atari not only started a whole new industry in 1972, it helped launch a revolution. First of all, Atari's video games subtly altered the relationship between people and their television sets by changing people's roles from a passive one to an active one. Then, by infiltrating so many homes (there was a videogame in 17% of American households by 1982), it prepared the way for a far more important device, the personal computer.

If the personal computer was revolutionary, then IBM came to symbolize all that was being rebelled against. "Personal" computers were designed by people who wanted their own machines, electronic hippies who didn't want to genuflect before drones in white lab coats to get computer time. For them, IBM was the enemy—rich, powerful and conservative—a company of blue-suited clones. IBM was the Establishment and its product was "impersonal" computers.

In their early years, companies like Apple and Atari could not have been farther in spirit from IBM.

One day, when Apple was readying for a visit from Bank of America officials, Mike Scott had to get a programmer to quickly expunge the low-score message "Pure Shit" from the Apple version of Breakout. And, at Atari, when a visiting rep from Sears viewed a program he found bizarre and wondered aloud what drugs the designer had been on, someone stepped forward with a lighted joint to show him.

But the wild and woolly days began to change as Corporate America took notice of the money these firms were generating.

Warner Communications, a huge entertainment conglomerate with holdings in the film and record industry, took over Atari in 1976. It sank a lot of money into the VCS game unit and brought it to market in 1977. Even then, there was a lot of competition and Atari might not have survived without the backing of its parent company. But in 1979, Warner's patience paid off when Space Invaders arrived from Japan and touched off a worldwide videogame craze.

By then Nolan Bushnell was gone. He had hung around as chairman for a couple of years after Warner took over, but his interest faded quickly. Early in 1979 his position was filled by Ray Kassar, one of the first of a new breed of executives to arrive in the upper echelons of the personal computer industry.

Unlike Scott and Markkula at Apple, Kassar had no prior knowledge of, experience with, or interest in computers. His background was not in engineering, but in textiles—underwear and rugs, to be precise. He cut out tub parties, cranked up security and established dress codes. "Marketing" became the new battle cry.

The year that Kassar took over as chairman of Atari was significant not only for the arrival of Space Invaders, but also for the debut of Atari's own computers. The Apple success story was a powerful reason to enter the market, but where Breakout had exerted a subtle influence upon Woz and the Apple II, videogames played a more prominent role in the development of the Atari computers.

Since games were already an important segment of computer software, it was clear that any computer produced by Atari, the acknowledged leader in videogames, would be a formidable game machine.

In fact, Atari's computers evolved out of its home videogame unit, the VCS (Video Computer System), with Steve Mayer and Joe Decuir being principal designers of both systems.

Powered by the same microprocessor as the Apple II, the Atari computers used additional custom chips which made them unrivalled in the home computer market for sound and graphics. Jay Miner designed the ANTIC and CTIA chips, while Doug Neubauer did the POKEY chip.

Neubauer also wrote Star Raiders, the game which showcased the Atari's advanced graphics so well that many people bought the computer just to play the game.

In addition to their game-playing ability, the design of these new computers reflected Atari's mentality in another way.

Woz had given the Apple II eight slots which were specifically designed to make it easy to hook up additional circuit boards. Atari computers, on the other hand, were basically closed systems, having only a few slots intended for memory expansion. The Apple II's design attracted numerous companies which became rich making peripherals and add-ons. The availability of such items played an important role in extending the life of the Apple II, and was just another element in the synergy of success which the Apple II enjoyed.

Despite this shortcoming, Atari's computers initially sold well and soon carved out a respectable share of the home market. Nevertheless, it was VCS sales which accounted for the major portion of Atari's revenues. In 1980, Apple products may have been selling like crazy ($117 million in sales), but Atari's volume of business was even greater ($415 million). In six months, Warner stock shot up 35 percent. Soon Atari was accounting for well over half of Warner's operating profit, including many times more than its record and film divisions.

But even as Atari reaped fantastic profits, it was already sowing seeds which would contribute to its own downfall. First of all, success made the new Atari overconfident; it was making so much money ($2 billion in sales in 1982) that it came to believe it thoroughly understood the home computer and videogame marketplace. In fact, no one did. It was a time when a new company like Osborne Computer could go from multimillion dollar sales one year to bankruptcy the next.

Even larger companies like Apple and Atari weren't impervious to financial trouble, as they were soon to discover. One reason was simply a factor of their explosive growth—they became increasingly bureaucratic and had trouble reacting quickly enough to the rapidly changing demands of the marketplace.

However, both Apple and Atari were generating so much revenue that they had a larger margin of error than smaller companies. Apple II sales carried the company through the twin debacles of Apple III and the Lisa, as well as the long development period of the Macintosh.

At Atari, the company continued to reap vast profits despite its backward policy toward software—a policy directly attributable to Ray Kassar's ignorance of the product he was selling. For the new Atari, computers and videogames were simply another consumer product whose success was primarily dependent upon marketing.

Atari had decided that the formula for success was in buying the rights to games like PacMan, which had already proved successful in the arcades, or spinoffs from movies like "ET" and "Raiders of the Lost Ark." Atari spent millions acquiring such rights, then fiercely protected them through lawsuits.

Consequently, Atari downplayed the importance of its programmers. After all, it was marketing, not programming, which had brought in the money. At a time when other companies were treating their programmers like rock stars and paying them sizeable sums in royalties, Atari refused to acknowledge their names and in many cases, as with Star Raiders, paid no royalties at all.

When some of them complained, Kassar claimed they were no more important than designers of towels. As a result, Atari lost a number of gifted programmers, who left to start up firms like Activision and Imagic, companies whose software sales soon began to bite into Atari's profits. In 1980, Activision's first year of business, the company grossed nearly $70 million.

Kassar also tried to keep the workings of Atari's new computers a closely guarded secret. To him, such a decision made sense in a highly competitive market. This decision, however, was clearly a mistake in the home computer market, which had a tradition of openness and sharing. More importantly, it simply retarded the development of software for Atari computers, and in one case, so angered a brilliant programmer named John Harris, that he refused to sell Atari his state-of-the-art game "Jawbreaker."

Despite the impressive growth of the home computer market, Corporate America was slow to take seriously the fledgling industry. After all, it had not been validated by IBM. But the spiralling profits of firms like Apple and Atari were blood in the water for the corporate leviathan. Soon, a Big Blue fin began to circle the upstart firms of Silicon Valley.

When IBM finally decided to get into personal computers, they first considered buying a firm already in the market, thus leapfrogging the costly delays involved in developing a computer from scratch. The group that was put together to explore this option recommended that IBM buy out Atari.

The proposal was brought to a dead halt, however, because IBM chairman, Frank Carey, wanted only "the best," and according to the advice he was given, that meant Apple, not Atari. Since Apple was sure to resist a take-over attempt, IBM's only alternative was to bring out their own personal computer. They did so in 1981, after a development period of only a year.

It was an amazing feat for a company as elephantine as IBM. Perhaps equally remarkable was the open architecture that it employed, making it closer in spirit to the Apple II than the Atari 800. Such openness was distinctly un-IBM-like.

While the PC was under development, IBM approached Bill Gates, another computer whizkid and co-founder of Microsoft. At the time Gates was working on a version of Microsoft Basic for the Atari 400/800, and had a meeting with Ray Kassar scheduled the next day.

Hurriedly, Gates cancelled that meeting so that he could receive IBM. Before any discussion could begin, however, Gates was obliged to sign a document which pledged his secrecy on matters relating to IBM, but gave IBM free use of any secrets Gates himself might inadvertently reveal. Despite this lopsided agreement, the meeting turned out to be a very profitable one for Gates, as it ultimately led to his company's development of MS-DOS, the operating system for IBM's new PC.

Dealer / Distributor Enquiries Welcome!

The 1991 Glendale Show

Gary Klugman
SVACE

Once again, my commuter jet descends into the LA basin. Thoughts of LA Law, beach bunnies, the freeway system and breathing smog fill my mind. My mind clears, I am a man with a mission.

I am covering the Glendale Show for the readers of Atari Interface magazine.

This was the fifth year for the Glendale Show (a.k.a. The Southern California Atari Computer Faire). The show is promoted as the largest Atari show in the US.

It began as a co-operative effort between southern California Atari user groups. One of the first year's organizers was a user group president named Bob Brodie. Another was a C.P.A. named John King Tarpinian. John has headed up the show ever since.

This year's show had an attendance of approximately 3,300. That's about a 1/3 increase over last year. No one was quite sure why there was the increase. Speculation was that local users didn't have a World of Atari show this year, so they were show-starved. Also, advertising was handled differently.

For many people, the most exciting thing was the showing of the ST Book. The ST Book is a notebook-sized ST that can run for up to 10 hours on AA batteries. It can also be run on a rechargeable Ni-Cad battery pack. It uses a pad in the upper right corner of the keyboard instead of a mouse.

Although it must use an external floppy drive, the base unit will have an internal 40 meg hard drive. The Book has an expansion port and the usual ports including MIDI and external mouse. The base unit will have one meg of memory, and there will also be a unit with four megs of memory and an 80 meg hard drive. The base unit is expected to be priced at around $1700. The ST Book is expected to be available in limited quantities late this year.

In a seminar by Atari employees Jim Grunke (head of Atari's music/MIDI division) and Bill Rehbock (head of developer support), attendees were told Atari is also developing the STylus.

The STylus is a pen-based computer that is to begin production in 3-4 weeks. This computer recognizes the handwriting (actually printing) of its user. They felt the STylus has a market advantage over similar systems because it already has a lot of software available for it—it will use ST software. The STylus is expected to have a retail price of around $1200.

Another subject brought up in the seminar was that Atari has turned the Hotz Box development and production back to Jimmy Hotz to market himself.

The upcoming CDAR-505 CD ROM drive/compact disk player is a SCSI device. So, it will need a host adapter (like Atari's, ICD's or Supra's) for use on STs and Megas. It can also be daisy-chained from your current hard disk if you have one.

Jim and Bill said Atari couldn't be sure how many dealers in the US carry the ST now because many businesses

buy their computers from distributors. Atari is limiting sales of their TT to key retailers called AEGIS dealers. Right now there are 70 of them in the US, according to the information presented at the seminar.

Lots of ST users arrived with disks in hand to get them upgraded by the software developers at the show. Developers did a brisk business bringing people up to date, with many developers running out of upgrade disks the first day!

The crowd was especially heavy on Saturday, making it difficult to talk to vendors and dealers. You had to wait your turn in the mob, and it didn't hurt to be a little assertive. The crowd thinned some in the afternoon.

Sunday morning was a bit slow, as usual for these shows, but the crowd picked up and stayed to the end. All the Atari shows I have attended (this was the 6th) have been quiet by Sunday afternoon. I didn't see much heavy discounting (dumping excess inventory) this show. I didn't see any 8-bit things at all, except at the Best Electronics booth.

I'll try to describe a few of the new things I saw. I apologize for anything I missed. It was difficult getting around to everyone and spending the time necessary to get the information.

Rod Coleman was there showing his beta version of Sudden View. Rod is the programmer and owner of Sudden Incorporated. Sudden View is a novel new accessory text editor. It has unusual editing capabilities done easily with the mouse. It also has powerful search capabilities. It will retail for $69.95.

The CodeHeads were showing MultiDesk Deluxe for the first time in America. Unlike MultiDesk, you do not need to load all of your accessories at once. So, you save valuable memory. MultiDesk Deluxe can load an accessory, then dump it out of memory, and then reuse the memory for another accessory. They are also importing a high-end graphics tool called Avant Vector, with a very smooth user interface.

Another program not done by the CodeHeads but meeting CodeHead standards is Repro Studio. It is an image editing program complete with a high quality hand scanner.

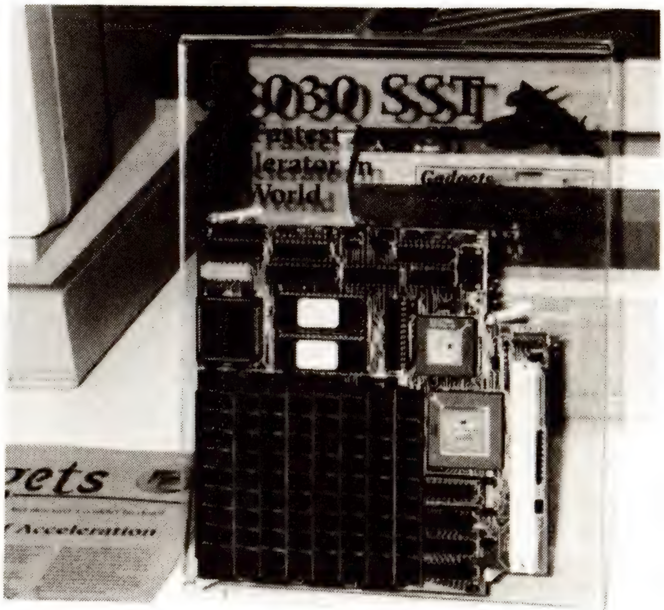
Genus is another import that is a powerful font editor. MultiDesk Deluxe retails for $49.95. Avant Vector has a two-level pricing scheme—The low end package retails for $445 and the high end is over $800. Repro Studio is $850 with the scanner or $195 without the scanner. Genus is $175 retail.

Rich Betson of Rimik Enterprises had MultiGEM Plus. The program enables the ST to multitask using the accessory slots. The $129.95 Plus version is an enhanced version of MultiGEM, with utilities to handle program watching, programming, file copying, and print viewing. The original MultiGEM without utilities will continue to be marketed for $99.95.

Michael Vederman of Double Click was showing the new DC Data Diet ($59.95 until Dec 1). The diet is a real-time data compression utility that reduces the space utilized by files on disk. It has all the thoughtfulness in the program that has become expected from the Double Click people.

Ever hit two ST keys at the same time? I do, a lot. Notice how that is less common on a PC keyboard? The reason is there is greater space between the keys on the average PC keyboard. Although he didn't have it to show, Brad Koda of Best Electronics will have key cap replacements for the ST for $49.95 that addresses this problem.

Brad did have TT Touch to improve the feel of the ST keyboard. The TT Touch gives the keyboard an im-



proved tactile feel with definite click feel so you know when you hit a key. These replacement contacts have a suggested retail of $44.95.

Gadgets by Small had their Spectre GCR, of course, but they were also showing their soon to be released 68030 SST. This board can speed up your ST to 40 MHz, maybe more, if you have the money for the chips. Base price for the board is $599 without chips. Putting a 16MHz 68030 and four 1-meg SIMMs on the board adds $460 to the price.

Application & Design Software had Universal Network. The $219 software allows networking between different two STs. The hardware cost depends on the ports used on the computer—Universal Network supports the LAN ports on the TT and Mega/STE. The hardware runs from $30-40 per node.

Formerly known as WuzTEK, Omnimon Peripherals Inc. had planned to introduce the OmniChrome board at the Glendale Show. Although it wasn't ready to show, veteran electronics engineer Norm Weinress expects it soon. The OmniChrome will give the ST user more colors and higher resolution.

Gary Klugman and Dave Plotkin (right)

There will be different levels of OmniChrome, each allowing higher resolution. With the appropriate board, the resolution will only be limited to the amount of RAM installed and the monitor being used. OmniChrome will plug into standard STs and display 256 colors out of 16 million in 640x200 resolution on a standard ST color monitor. Add a multisynch color monitor to your ST and OmniChrome will give you 256 colors in 800x600 resolution. Cost for the board is expected to start at $399.

ISD's Nathan Potechin was demonstrating Calamus SL and DynaCADD on a Mega ST equipped with Jim Allen's Turbo 030 board running at 40MHz. Calamus SL could also be seen on a TT with MATRIX color board in the Atari booth.

Hybrid Arts was showing Digital Master, a direct-to-disk sound recording and manipulation package geared toward small to mid-size TV and radio stations and recording studios. Price was slightly under $4,000.

Rio Computers was showing off the new Lexicor software products. Lee Seiler of Lexicor was onhand to demonstrate Chronos-3D and Prism Paint. Rio was also selling a Genlock for the ST, Supercharger IBM emulators and a VGA card for Supercharger for $499.

Quick ST 3 was available at the Branch Always booth and was selling well. In fact, Darek Mihocka sold out of his original batch and had to make more on the spot.

Unfortunately, the disks duplicated at the show report that they were infected with a "SIGNUM BPL" virus and some of the files on the disk were damaged. If you received one of these disks, contact Branch Always and they'll get you a replacement. Darek was also showing a TT version of his Xformer 8-bit emulator, running at full 8-bit speed.

Gribnif sold out of Stalker 3, an excellent terminal program that supports full background processing and multiple online sessions. Gribnif was also showing Arabesque, an imported drawing program that handles vector graphics and bitmaps.

With a turnout larger than last year, the show was a big success. Developers and vendors were pleased with sales. The fact that there wasn't the heavy discounting seen in other shows signaled a possible end to the shake-out of third party developers. Developers now are either making enough money with Atari computers or they have sources of income elsewhere in addition to their Atari income.

The increased attendance is an indication that there are still a lot of Atari users out there interested in expanding the utility of their ST computers, being more productive and adding more power to their ST computers.

EdHak 2.24

Bill Rayl

This review is long overdue. I've been an avid user of EdHak for nearly two years, and I'm finally getting around to writing a review of it. Why has it taken so long? The reason is simple—I've come to depend upon EdHak and use it as an integral part of what I do with my ST. EdHak seems like it's almost a part of my computer, so much so that I never thought about reviewing it. The concept of reviewing EdHak was about as far from my mind as reviewing the internal disk drive or the SM124 monochrome monitor.

I recently received version 2.24 of EdHak, and that is what prompted me to finally sit down in front of the ST and write this review. In beginning this article, I realized that not everyone may know what EdHak is. That was also a strange notion to me, since I've come to depend on EdHak for all my file editing needs. After all, everyone should be using this product, so everyone should already know about it. Right?

Well, everyone *should* be using EdHak. It's a great little editor that can be used either as a desk accessory or stand-alone program. Even better, EdHak can handle the toughest editing jobs with ease. You can edit text files, your ST's memory, disk sectors...just about everything!

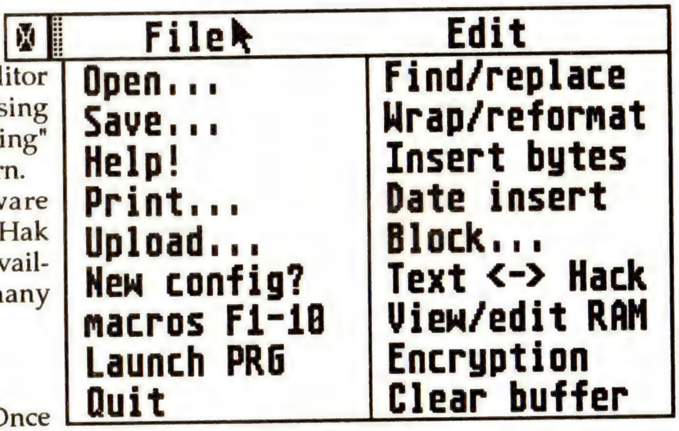
When I need to edit anything, I use EdHak. I haven't used a word processor on my ST for months. All the articles I've written for Atari Interface in the past year have been created in EdHak. I also use EdHak to format information for importation into databases (I do a lot of database manipulation). Occassionally, when I have the misfortune of trashing a disk directory or inadvertantly deleting a file from disk, EdHak comes to the rescue.

EdHak is probably the best bargain in the ST/TT market.

Past and Present

EdHak started its life as a shareware program called Diary. Craig Harvey, the program's author and president of Clear Thinking, was dissatisfied with the text editor accessories available for the ST. So, being an enterprising guy, he wrote Diary. Later, Craig added memory "hacking" features, and EdHak (the editor/hacking utility) was born.

Diary and EdHak have won a number of shareware awards in the past couple of years. As of version 2.2, EdHak has gone commercial only, although a demo version is available from Clear Thinking or most online services and many BBS systems. Currently, EdHak is at version 2.24.



Ease of Use

EdHak is as easy to use as a text editor should be. Once up and running, you can simply start typing away. The title bar at the top of the EdHak editing window shows you the name of the file you are editing, as well as the current line number and cursor/character position in that line. At the far right side of the title bar is a sizing button. Clicking on this button toggles the display between full and half screen modes. A close button at the far left will exit you to the desktop.

Next to the close button, the word "Menu" appears in the title bar. If you place the mouse cursor over this Menu entry, a double wide GEM drop down menu appears. From this menu, you can select many of EdHak's powerful functions, like Search and Replace, Uploading of text via the modem, file Encryption, and even running other programs from within EdHak.

A scroll bar at the right side of the edit window allows you to scroll through your text file, or you can use the up and down cursor keys. Pressing either Shift key in conjuction with the up and down cursor keys allows you to move back or forward one page at a time.

While the EdHak manual fully explains all the features of the program and how to use them, EdHak has a built-in help feature for quick reference. To access the help menus, simply press the Help key (or select Help! from the Menu). These help menus list all the keyboard equivalents for all of EdHak's functions.

Insert Anything

One of EdHak's most powerful features is its ability to edit just about anything. In keeping with that flexibility, the program allows you to insert any character—not just the standard ASCII characters—by entering them as text or via their decimal or hexidecimal values.

EdHak's search and replace options take this even one step further, allowing you to search and replace using text strings or decimal/hexidecimal values. And, you can do this independently for each string.

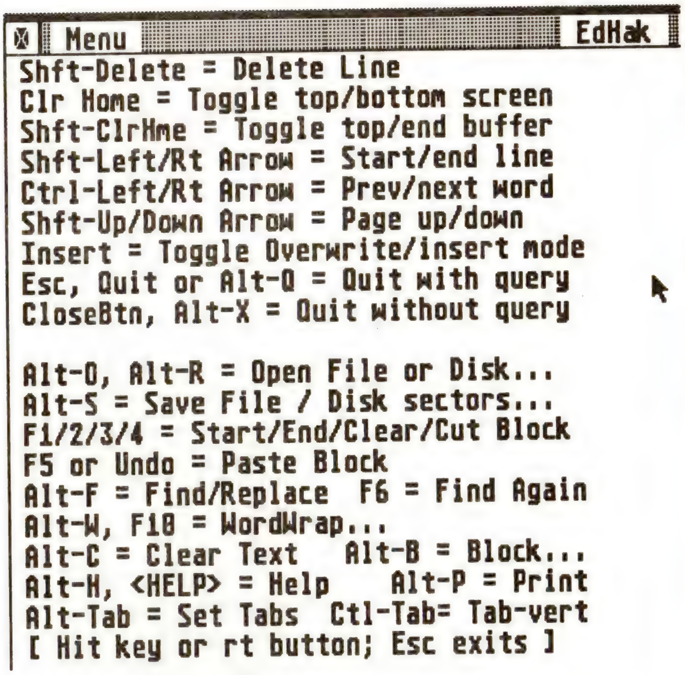
For instance, say you have a text file created on an Atari Classic (8-bit) and the carriage returns all show up as a cent sign when you load the file in. That's because the ATASCII carriage return has a decimal value of 155, the value for the cent sign in the ST's ASCII character set. To replace these ATASCII carriage returns with ASCII carriage return/line feed sequences, you can search for decimal 155 characters and replace them with Control-M (carriage return) and Control-J (line feed) text sequences.

Blocking Made Easy

Selecting text blocks in EdHak is a breeze. You can simply use the mouse to select blocks. Just place the mouse cursor at the start of the text to be selected, press and hold the left mouse button and drag the mouse to the end of the area to be blocked.

If the end of the text block is off the current display, EdHak will automatically scroll when the mouse cursor reaches the top or bottom of the display. Once you're done with the selection, simply release the mouse button.

As an alternative to the mouse, you can press F1 to start a block and F2 to end, while F3 clears the block and F4 deletes the selected block. Users of the Flash! telecommunications program will recognize this as the same way the Flash! editor works. As with Flash!, pressing the Undo key will restore the last deleted block. Using F4 and Undo is a quick way to do block cut and paste. Block cut, paste and save are also available by selecting the Block option in the drop down Menu. You can even print a selected block.



```
Shft-Delete = Delete Line
Clr Home = Toggle top/bottom screen
Shft-ClrHme = Toggle top/end buffer
Shft-Left/Rt Arrow = Start/end line
Ctrl-Left/Rt Arrow = Prev/next word
Shft-Up/Down Arrow = Page up/down
Insert = Toggle Overwrite/insert mode
Esc, Quit or Alt-Q = Quit with query
CloseBtn, Alt-X = Quit without query

Alt-O, Alt-R = Open File or Disk...
Alt-S = Save File / Disk sectors...
F1/2/3/4 = Start/End/Clear/Cut Block
F5 or Undo = Paste Block
Alt-F = Find/Replace  F6 = Find Again
Alt-W, F10 = WordWrap...
Alt-C = Clear Text   Alt-B = Block...
Alt-H, <HELP> = Help    Alt-P = Print
Alt-Tab = Set Tabs  Ctl-Tab= Tab-vert
[ Hit key or rt button; Esc exits ]
```

Other Features

EdHak also handles word wrapping. You can set the right margin, and many other options, by selecting the New config? entry from the Menu (or by pressing Alt-N). Then, by selecting the Wrap/reformat entry or pressing Alt-W, you have the option of reformatting the entire text buffer, the current paragraph or a selected block of text. You can also turn word wrap off.

You can edit files of *any* size with EdHak; the only limitation is the size of your storage medium. EdHak allows you to define its buffer size from 4K up to 97K. If an edited file is larger than the buffer, EdHak allows you to edit the file section by section. So, you can even edit files that are larger than the system memory, something no word processor on the ST market that I know of will allow you to do.

When you reach the bottom of the current buffer, EdHak will automatically load in the next section of the file. If you have made any editing changes, you will be asked if you wished to save them before continuing. You have the option of saving only the current buffer or saving the buffer back to the complete file.

For the security conscious, EdHak offers full encryption of your files. You supply the password used for the encryption/decryption. If you use this option, make sure you don't forget the password, or you will lose your files forever. (It's a good idea to keep an unencrypted version of the files somewhere, just in case you do forget.)

EdHak offers a pile of other features, but I think you get the idea. This is one heck of an editor!

Safe Sectors

One use for EdHak that many people may not even think of is to help protect you from damage to floppy disks. If you're like me, you have a "library" (however loosely organized) of software, graphics, etc. stored on floppy disk. While I hardly ever make modifications to these disks, I do copy files off them from time to time.

How can EdHak protect these floppies from damage? Well, EdHak isn't just a file/text editor. It can also edit disk sectors. Nearly every ST user at one time or another has "trashed" a floppy disk. What usually happens is that the sector on disk that holds the directory or FAT (file allocation table) gets messed up.

Using EdHak, you can save the first few sectors of each floppy to a file—one for each disk in your collection. This gives you a safe backup of the boot sectors, FAT tables and directories for your floppies. Every time you update a floppy, simply make a new backup file for that disk and you're pretty safe! This can also help you out if your disk library ever gets infected by a boot sector virus.

QuikSend

As mentioned earlier, EdHak can be used as either a desk accessory or as a program simply by renaming it with the proper file extension. As a desk accessory, EdHak offers a number of very nice uses. For instance, version 2.2 and above have a "Quiksend" feature. This features allows you to send a marked block of text to an open window of another program.

This is a great feature, especially for PageStream users. You can have a PageStream document open with a text frame just waiting for text. Rather than typing the text directly into PageStream—a process that can be rather slow—you can use the full editing capabilities of EdHak. Once your text has been created, simply select it as a block, hit Alt-K and watch as EdHak places the text into your PageStream document! It's like having a built-in word processor in PageStream.

Interfacing

Users of the CompuServe online service may also find the combination of EdHak and QuickCIS a useful addition to their libraries. QuickCIS is an online navigator for CompuServe written by Jim Ness. The program allows you to respond to messages and select file for download while offline. Once you've created your responses, etc., QuickCIS calls CompuServe for you and posts your replies. This can be a real money saver.

As of version 2.24, EdHak can be used in conjunction with QuickCIS, giving QuickCIS a much needed full-featured text editor for message creation. QuickCIS is available for download in the ATARIPRO Forum on CompuServe.

Wrap Up

Now that you know what EdHak is and some of the great things it can do, you'll probably be surprised to hear that the program retails for only $18.95 and upgrades are only $5! A super program at a super price. EdHak is probably *the* best bargain in the ST/TT market. And you get full support for Moniterm monitors and all ST and TT resolutions, as well.

So, what are you waiting for?...buy EdHak now. You'll be glad you did.

EdHak

Even Faster Display

2.2

is here!

Edit ANYthing ANYtime
A Desk Accessory (& PRG) to edit
Text, Data, Binary Files, Disk Sectors, RAM

Great ACC for Word Processing!
All ST / TT / Moniterm Resolutions
File size not limited by available RAM

Available from your Atari dealer,
or direct from Clear Thinking.
(VISA/MC Welcome. Outside US add $3.00)

PageAssistant

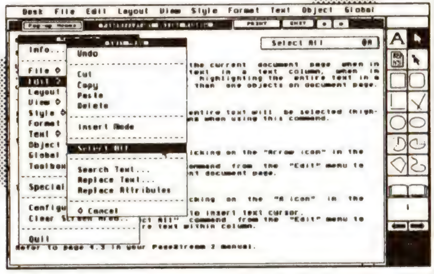
For PageStream 2.1

The Online Help Companion

PageAssistant will help to quickly transform the beginner to a full fledged typographer. The user will have immediate access to power tips and step-by-step examples. Its straight forward approach using the pop-up overlapping menu layout will easily guide you through each and every aspect of the PageStream program. Each menu item is followed by manual references to indicate the exact pages in the manual that discuss the command. As you progresses with PageAssistant you will find new, tremendously efficient means to creating truly professional documents with PageStream 2.1. *Prepare to become a PageStream Power User!*

$49.95
Plus $2 Shipping & Handling

Free Color Brochure Available. Demo diskette is $5.00.



❖Includes a 52 page manual (8.5" x 7") packed with tutorials on how to master the macro command, design textual and graphic effects (such as rotating objects in a circle, place text on a path, etc), layout tutorials and much more.
❖Send summary to printer for hardcopy reference.
❖Tutorial on color separation.
❖Resolution independent!
❖Easy installation.
❖Runs as an accessory.

Sex, Lies and Graphics/Video

(but without any sex or many lies)

Jay Craswell
Contributing Editor

Character vs Graphics Modes

This is a pretty straightforward topic. Text on some machines is extremely fast. IBM machines have a character generator that lets you "squirt" (technical term, grin) whole characters onto the screen with very little effort (or time!). The Macintosh, on the other hand, is more flexible with the characters it can squirt and, in effect, makes the CPU do all of the work displaying text...slow! Both systems alone have severe shortcomings.

Atari, in its infinite wisdom, has the Blitter that works like a character mode display but allows you to select the fonts (via software) to be squirted on the screen. Even better, you can do the same sorts of things into printer RAM! More about the printer stuff in a later article.

Scalable Fonts

Most of us have heard about scalable fonts. What they are is rather simple. The idea is to have a program take the outline of a single font, such as Times Roman, and generate that same font in different sizes—scale (or resize) a font from 72 point down to 6, for example.

The problem is that the technology to do this in the laser printer is slow and the work done on the screen font is awful! The problem is that laser printers are 300 DPI (at least) and your standard computer monitor is around 75 DPI. This difference shows up as pretty printed text and jagged, boxy-looking screen fonts.

In the Mac world, as mentioned in my previous month's column, you have 72 DPI at all times or Apple users shun you like a plague. Somewhere it is written that Mac fonts are to be 72 DPI or you will roast in hell! The real reason for all the excitement is that Apple pretty much locked themselves into that setup by not having a way to deal with any other DPI.

Many people see this problem as insoluble until screens capable of 300 DPI display are made. While such screens are possible, they are slow to paint to and are very "bleeding edge."

There are scalable screen fonts, of course. Can you say "Display Postscript?" But, Display Postscript is expensive and not all that fast. Worst of all, it still has the jaggies!

A possible solution to these screen fonts with jaggies is to employ a technology known as anti-aliasing. Simply put, you apply gray scales to the characters. Many of you may be shaking your heads thinking that a character on a page is black and white with no shades. Think of it this way: which document looks better on your screen, one scanned in with a B&W hand scanner or one with an HP or Canon flatbed, gray scale scanner?

While working at Image Systems, we presented a state-of-the-art monitor running almost 300 DPI. In the same booth we had a 72 DPI screen showing text with 16 grays (it was scanned in). All of the people that saw the two thought the 72 DPI screen was our "near 300 DPI" monitor.

I guess it's safe to say that gray scale information can indeed give the appearance of higher DPI. And remember that, in the world of displays, it's the appearance alone that is important!

This wasn't the first time that I experienced this illusion of added DPI via gray scales. As a junior bottle washer at CPT Corporation (defunct now, I think) we worked on some pretty fancy gear. One project had us playing with a 1024x 768 high resolution graphics controller that allowed 16 gray scales. The idea of a scalable screen font was the goal, and to that end, work was done to create the smallest possible font.

Face it, a 1x1 font is unreadable no matter how many gray scales you use.

But, would you believe that a 2x2 font was recognizable? True...and with only four measly bits in the character cell! The alphabet was drawn on the screen with handcrafted characters using 16 shades of gray. One after the other, we asked people if they recognized the line of text. To a person, everyone correctly identified it as the alphabet.

This caused a *lot* of head scratching. Maybe it was outright disbelief that it worked or maybe the effort needed to scale these types of fonts was too much. Either way, the project was shelved.

Today, there is one IBM company that has a simple version of gray scale fonts for Ventura Publisher now. They look loads better than the black and white fonts. Too bad the card they use draws *so slow.* Thank the wonderful world of paging and segments for all this "speed."

Now I wonder what Atari developer will finish this project? I imagine a certain 1024x768 graphics screen with gray scalable screen fonts might even make some Mac, IBM and Amiga publishing and wordprocessing users sit up and take notice.

VGA Chip Sets

Questions about "VGA" are easily one of the most often asked. These are either "Why don't you sell your card for $250 like the 'fill in the blank' IBM VGA card company from Walla Walla, Washington?" or "I bet I could get a VGA chip that would replace your ISAC for 1/2 the cost."

First, the comparison between ISAC, ALBERT and VGA is unfair. Most VGA cards are interlaced. Almost all of us have seen an Amiga blinking away to beat the band. Interlaced video is just awful unless you are exporting it to video tape, and for that you need to be able to do low resolution 524x524. Interlaced display is good for making a slower monitor display higher resolutions without actually having to run at a higher speed.

Nowadays, most PC dealers don't even show demos in the interlaced mode. It turns off the clients (or makes them seasick). However, when you ask them for high resolution, most will show you Windows (*or some other thing*) running in 800 x 600. At least in this mode the display is noninterlaced.

Now, I'm not saying that there aren't non-interlaced 1024x768 cards out there. Indeed, there are! And, if you look in a recent Byte, you will see an article on one priced at $599.

Say, isn't that the same sale price as ISAC? Yes, of course it is.

Before I get a rash of calls from people with some VGA card that *can* be forced to run non-interlaced and is cheaper, let me say this. There is a reason for this—volume price. Do you know how much money has been spent to cost reduce your typical VGA card? Most of them are not much more than a single chip with some RAM and a crystal.

So, why don't I make a VGA Chip? Money, folks. It's what makes the world go round, and you need great big bags of it to make a fancy custom ASIC. The masses scream "Why don't you buy a VGA chip from Western Digital or whoever?" Ladies and gents, I would if I could make it work. VGA is a weird mother.

Yes, I could easily stuff one on a card and might even get it to light up and draw some pretty pictures and run some canned demos. But get the Atari OS to work with it? Draw the Desktop? Run VDI? No way! Not without rewriting most of the graphics system, VDI, etc.

The KAOS people over in Germany might have been able to rewrite much of the TOS 1.4 ROM in assembly, but even that is not the same as replacing it with functionally equivalent code for a different type display screen that works.

Hiring a staff of programmers to work for years is unacceptable to me and, to be honest, I believe the results would be unacceptable to the software developers. Believe me, it's hard enough with a similar screen map and a simple driver to get everything just right.

SHAREWARE & PD

A great PD catalog with great prices!

It's true! Our catalog offers full multi-line descriptions for over 150 double sided disks packed to the brim with the very latest public domain and shareware software—all archived to give you the most for your hard-earned money. Each disk is also protected by a virus guard to eliminate any worry about system problems.

Send $6.00 for your 80+ page catalog and receive a bonus $6.00 coupon for a complimentary first purchase. Our everyday low price is $6.00 per disk.

So You Want to Start a User Group? Part III
A Primer for Starting Your Own User Group

Tim Holt
Contributing Editor

Last time, we looked at how you go about getting and keeping members in your group. Remember, getting members is easy, *keeping* them is the hard part.

Okay, so you got a group of people, some you know, some you don't. What do you *do* with them? This time, we will look at ways to make the actual meetings an interesting and educational opportunity for you and your members.

How to Keep it Fresh!

First of all, you hopefully have chosen a meeting place that can accommodate a few computers. Ask members to bring their systems (that's right the entire system) to the meeting. I know, it is a real pain in the tush to rip out your system and bring it to a meeting. (This is one area where Macintosh has us beat.) However, the more computers you have at a meeting, the better it will be for everyone.

Trust me. Think about a meeting of 25 people. Now, think about those same 25 people all trying to look at your *one* 13 inch monitor. Get the idea?

Now imagine those same 25 spread out over seven or eight monitors and computers. Believe me, Billy Bob in the back row is gonna get bored *real* fast trying to see *one* computer way up at the front.

Okay, you have a bunch of computers, and they are all humming away at the meeting. Now what? Well, most members expect a demonstration of some kind. What kind of demonstration? Remember how I said in a previous article that most people plop down the membership fee and expect a song and dance? Well, get out your tap shoes....

This is where you can let your imagination run wild. You can demo *anything*. Games, utilities, accessories, hardware, software, modems...you name it, you can demo it. Chances are, there is a game on your shelf collecting dust that *no one* in the group has ever seen before. (Can you say Harmony by Accolade? Sure, I knew you could.) Make a demonstration of it!

Themes

At ACCEPT, we like meetings that have a *theme*, like "Word Processors." If you chose to do this, invite several folks to bring the word processor they are most familiar with, set the computers up side by side and demo away!

Here are a few examples of *themes* that we have had at our meetings. (Feel free to steal, as we stole these from other groups...)

Word Processing—Compare several programs, such as WordPerfect, WordWriter, WordUp and ST Writer Elite, etc. Actually, you could probably give a demo on each one of these, so that is 5 meetings worth of demos.

Games—Everyone has a favorite game, or as the Messy-DOS people call it, Entertainment Software. You could even break this down into sub-themes such as Arcade or Fantasy/Role Playing. Again, several demos going at once is better than one at a time, so folks can stroll behind the users and get a nice view of what is going on.

Desktop Publishing—Timeworks, Calamus or Pagestream all could easily take up an entire afternoon or evening's meeting. However, running them side-by-side, and showing the output of each is a tremendous selling point.

And, these types of demos are essentially someone trying to convince someone else that this program or that hardware is so good that they just cannot live without them. Again, if you just have one computer per meeting, you have three meetings worth of demos in just this one theme.

Telecommunications—Compare all

the different modem programs. If the club has a BBS, get the Sysop to demo how to use the system to its best advantage. (Don't try this in a room without a phone jack. The results are pretty sad.)

Best of Public Domain—This is where the club librarian comes to do his or her thing. Let the librarian show the club a small selection of the finest things in the club's library. Here the choices are unlimited.

Don't think there is a lot of PD stuff out there? Before American Express started wanting me to actually *pay* them for using GEnie, I counted over 17,000 files in the Atari ST area alone. Who knows what it's up to now. Many of the PD and Shareware programs can be used with the other themes as well, such as Vanterm for the Telecommunications theme.

Art—How do all those art and paint programs work? Drag out your old copy of NeoChrome, and boot it up. Demo it against Spectrum, Prism Paint, etc. See what happens when you load up a nice picture of Christie Brinkley and start drawing a 5 o'clock shadow on her...give her some chest hair, and make her bald at the same time. This is always a crowd pleaser.

Macintosh Emulation—Someone in the club has to have a Spectre GCR cartridge from Gadgets by Small. These little beauties are the most fun you can have without laughing. Invite your hardened "Mac-friends" to your "Mac" meeting. Watch their faces as they watch your Atari ST "game machines" boot up with a Mac logo, and have it say "Welcome to Macintosh." I almost guarantee that at least one club member will run out and buy a Spectre GCR after coming to this meeting.

Make your Atari FAST!
WARP 16 FAST!

The WARP 16 accelerator + cache board contains a high speed 68000 CPU that replaces the slower 68000 CPU currently used in your Atari.

By taking advantage of the large amount of high speed cache ram on the WARP 16 board this CPU is able to run programs at twice the speed of an unmodified Atari.

Routine tasks such as spellchecking, spreadsheet calculations, screen redrawing, and laser printing take a fraction of the time they used to.

No longer are you frustrated by waiting for your computer.

WARP 16's custom logic allows caching of both reads and writes AND caching of both "byte" and "word" memory accesses.

What does all this mean?

Your Atari moves FAST! WARP 16 FAST!

Features:
- 16MHz CPU accelerator with cache for all Atari ST/MEGA computers.
- 80K of high speed static ram. Organized as 16K cache-tag ram + 64K cache ram.
- FOUR TIMES MORE cache ram than any other Atari accelerator on the market.
- User selectable "stock ST" mode gives 100% compatibility with ALL Atari software. Even Spectrum 512.
- For use with Atari ST, MEGA, and STACY computers.
- STE version available soon.
- Don't settle for other upgrades that offer tiny amounts of cache ram, or offer compatibility with 80% of existing software.
- WARP 16 offers a full 64K cache + 100 percent software compatibility.
- Dealer inquiries welcome.
- Order your WARP 16 TODAY!

WARP 16 $349.95 (U.S.)

Add $4.50 for shipping and handling. Note: WARP 16 requires installation by a qualified computer technician. This installation may be done at your local computer repair shop. Call us for details.

Make all cheques payable to:

VISA

CANOE COMPUTER SERVICES

Payment forms accepted: Certified Cheque, Money Order, VISA

MS-DOS Emulation—PC Ditto, Ditto II, PC Speed, AT Speed, AT Once—they all work well, and they all work on your ST. Demonstrate how someone who uses an IBM at work can come home at night and crank up the old ST to do the same things. Have speed comparisons, show some games.

Miscellaneous Themes—Any of the themes that you used for the ST can also be used as sub-themes for the Macintosh and IBM emulators. Actually compare prices of IBM, Mac and ST software, and show the members what is the best buy. MIDI/Music, Accessories and Utilities all are fair game for demos. Just remember, *anything* in a computer store can be demonstrated.

Other Observations

Okay, you now have before you about a year's worth of meetings planned. Pretty easy, eh? Well, it is to a point. You do not want to get on a teacher/pupil relationship with your members. They probably know just as much as you do, they just don't speak in public. This is a condition called "Groupus Interruptus," and is common in all user groups.

Don't expect each meeting to be perfect. Sometimes, you will have ten people in front of you, and the demos go just as you planned. At other times, fifty people will be watching as your hard drive refuses to boot, or you can't get the paper into your printer. Hey, it happens to all of us, and it isn't any big deal. If your demo screws up, it screws up. If anyone complains (which they won't), tell *them* to get up front and do a demo. This usually shuts them up pretty fast.

The key to successful demonstrations is finding out who in your group knows what. Is that quiet kid in the back able to destroy every living thing in the known and unknown galaxy? Well, he would make a great demonstrator of any new game. And, usually, people don't mind demonstrating something they know really well.

Don't ask Billy, who has never seen the actual keyboard, to demo a word processor. On the other hand, don't ask Rev. Smith to demo converting Xrated GIF pictures to the ST format. Know your group.

And don't limit yourselves to just ST-related shows. Do a demo of basic computer repair. Any computer user can relate to that. Have a meeting where the police come in and give a talk about anti-theft devices used in the home to prevent theft of computers.

See how it goes? You could probably think of all sorts of exciting demonstrations I haven't even mentioned. This time, we talked about how to give successful demonstrations. Next time, we will talk about special interest SIGs and some common problems faced by user groups.

Chicago Computerfest

by ATARI®

Ramada Hotel O'Hare

Rosemont, Illinois

November 23rd and 24th

Show Hours: 10am to 5pm

Atari is sponsoring its first show in the United States! This is the show we have all been waiting for. Come see the newest products available for the LYNX and the ST/ TT lines of computers. Plus many more exciting events!!

- * Major Developers
- * Vendors/Dealers
- * General Seminars
- * Over 28,000 sq. ft.
- * 8-bit Conference
- * Door prizes
- * Game Contests (ST & LYNX)
- * Banquet
- * Desktop Publishing Seminars
- * Mac/IBM Programs

ADMISSION: $6.00 at door
(advance discount tickets through User Groups)
Children under six **FREE** with paid adult admission

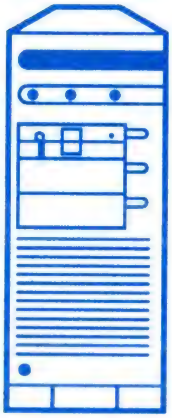
WHAT DOES THE FUTURE HOLD



[Copyright 1991, Chuck Steinman and DataQue. All rights to the material contained in this document remain the property of and are not to be distributed without permission of the author.]

Over the past several months, a number of people, including myself, have been kicking around what we Atari Classic (aka 8-bit) users would like to see in a new machine. What we have determined is that there are two distinct directions people would like to see their system develop into.

One faction would like to see a high-power application computer which would sacrifice compatibility to gain more performance. The other group would like to see a high-compatibility system which would allow use of the lower cost IBM/PC type peripherals.

While these machines would probably be marketed by DataQue Products, they will most likely not be considered as part of the DataQue line. This is primarily because the anticipated volume is not high enough to justify the overhead.

System #1: 1600XLE

The high-performance system has been named the 1600XLE to indicate that it is not only the ultimate machine (indicated by a numeric prefix which is higher than any previous model), but does mantain some degree of compatibility with the XL (the 'E' indicating enhanced). At this time, the following specifications have been formulated.

System CPU: 8MHz CMOS WD65-SC816P8 Processor. This CPU is similar to the Turbo-816 upgrade and Apple //GS, except it is running at a no-wait-state 8MHz. While this clock rate in itself is not particularly blazing compared to most modern async processors, you have to keep in mind it is a synchronous CPU and that its bus cycle is only one system clock. This is as opposed to the 68000 and 8088, which take up to four system clocks per bus cycle. To give you a relative index of the 65816 compared to the 68000 (as used in the ST) or the 8088 (as used in the PC/XT) see the chart at the bottom of the next page.

As you can see, the 65816 is significantly faster than either competitor. For example, an 8MHz 65816 executing an add with carry (word) instruction with a source address which is absolute indexed would take 625nS, while the 8088 would have to be running at 22.4MHz to take the same time period.

The 68000 in that example would have to be running at 28.8MHz for an equivalent execution time. Now you have some insight as to why the ST could not emulate the 8-bit very well.

Of course, each processor has its features and pitfalls. The 65816 lacks multiply and divide instructions, for example. The 8088 has a memory address limit which is only one megabyte while the other two are 16Mb. The 68000 is very slow when working with bytes (which is why most of the examples above were operating on words).

Speed is not the only reason for choosing the 65816, it also has a 6502 compatibility mode, which will allow it to execute the instructions of the 6502. Of course, the 6502 is the CPU which is used in all of the 8-bit Atari systems (including the 400/800/XL/XE/XEGS).

System DRAM

Since the 65816 can address up to 16Mb (actually it can address 32Mb, but I don't wanna give away too many secrets here), it was determined that there should be an easily expanded memory system.

Because of their low cost and availability, SIMM memory modules would be the first choice. These are currently available at well under $50 for the 1Mb

For the Atari 8-bit User?

Chuck Steinman

MAUG

version. Since the 6502 memory cycle is 1/4th the period of the 8088 or 68000, RAM interlacing will be required, so the SIMMs will have to be added in pairs. This is because DRAMs with access times under 60nS would otherwise be required, which are much more expensive than the 120nS versions which interlacing will allow.

The current plan is to allow for two pairs of modules, which would allow for 4Mb of DRAM in the system using 1Mb modules. Since the sockets will be wired to support 4Mb modules, a maximum of 14Mb of system RAM can be used (first and last meg reserved).

System SRAM

To allow for a low entry cost, the system area located in the lowest 64K of the memory map will use static RAM. This will be configured similar to the XE in that there will be a 16Kb window located at $4000 which several banks of RAM can be paged into using PortB of the PIA. While it will support the XE CPU mode, there are no plans at this time to support the ANTIC modes, since no ANTIC will be on the motherboard.

System ROM: The system will feature a custom operating system in ROM which is entry point compatible with the Atari XL/XE OS. There will be enhancements to this OS, mainly to support the additional peripherals and take advantage of the 65816 enhanced instructions. The OS will also feature debugging, diagnostics and configuration utilities. This OS does not support the international character set or cassette.

Applications

At this time, there are no plans to include any application programs in ROM with the system. This may change if DataQue acquires rights to some of the OSS/ICD products. The XL/XE's normally have BASIC in this area. Two 28-pin IC sockets will be left for this use, with a jumper to select either one 8K or two 4K ROMs. This would allow you to dismantle your favorite application cartridge and insert its ROMs into the provided sockets.

ROM Expansion

One XL/XE compatible cartridge slot will be provided. This will allow existing applications to run in the compatibility mode. Since most of these applications were written in 6502 language, they would only be able to directly access the XE memory. Memory managers such as RAMDisk drivers would allow such programs to use any expanded memory (over 1Mb). Again, if OSS/ICD products are obtained (or any others for that matter), they could be converted to directly access the full 14Mb of RAM.

SIO Devices

There will be one Serial I/O channel provided which will be compatible with

Operation	**65816**	**8088**	**68000**
Load register immediate byte	2	4	8
Load register immediate word	3	8	8
Load register absolute word	5	14	12
Add w/Carry absolute,index word	5	14	18
Sub w/Borrow indirect indexed word	6	16	18
Branch short relative (false/true)	2/3	4/16	10
Jump to new absolute address	3	15	10
Jump to subroutine, and return	12	27	34

most Atari SIO peripherals. The SIO port would allow Atari devices such as floppy drives, printers and interfaces to be used without modification.

Keyboard

An IBM 101-key-type keyboard would be supported using the standard PC 5-pin DIN type connector. Special function keys on the Atari would be mapped onto function keys, and other features of the enhanced keyboards would be supported where possible, as in the TransKey adapter.

Other Ports

One RS-232 serial port would be built onto the motherboard for serial communications. The baud rate would be fully programmable with a maximum rate of at least 19,200, possibly higher. This would terminate into a standard DB-25M connector to provide maximum compatibility. A driver would be provided in the OS ROM.

One parallel printer port would be built onto the motherboard for use with standard parallel printers. This would be terminated into a standard DB-25F connector to provide maximum compatibility. A driver would be provided in the system OS ROM.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SI

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by:

Brand NEW *KE-SOFT* GAME Titles from *SI*

BOMBER JACK -- Superb battle of wits!
A S H I D O -- Ishido for your XL/XE
$10.50 ea. -- $9.50 for 2+ !

PLAYER'S DREAM 1 -- *PLOT* and *SKI RACE* (2 GAMES)
LEVEL DISK -- 35 New Levels for *TOBOT*, 50 for *SOGON*, & 100 for *CULTIVATION* !
$14.50 ea. -- $12.50 for 2+ !

This *SI* Informational Text page may be freely reproduced or excerpted in any media.

Two Atari compatible joystick/paddle ports would be provided, which would be terminated into two standard DB-9M connectors.

Expansion

Eight standard IBM/PC-XT type 62-pin card edge connectors would be provided for system expansion. This will allow many low-cost, readily available PC cards to be used with the system. Software drivers for popular cards would be provided in the OS ROM, such as those for CGA and MGA video cards. OS ROM extension headers will be scanned for in the $010000-$0FFFFF range.

Some of the cards which could be supported by the 1600XLE are:

- MGA Video (Monochrome, with support in the OS ROM)
- CGA Video (Color, with support in the OS ROM)
- EGA Video (Enhanced Color, support ROM on card)
- VGA Video (Analog Color, support ROM on card)
- Floppy Drives (5.25" and 3.5" supported in the OS ROM)
- Hard Drives (support ROM on card)
- Serial/Modem (support in OS ROM)
- Parallel (support in OS ROM)
- Scanner/Barcode (support ROM on card, or software driver)
- Mouse/TrackBall (supported with software driver)
- Sound and/or MIDI (support ROM on card, or software)

Since there is a wide range of applications and needs requiring different video outputs, no video hardware will be provided on the motherboard. If there was a significant demand for an XL/XE compatible video output, such an expansion card could be made. Because ANTIC and GTIA must be clocked at 1.79MHz, wait states would be required and CPU halts inserted as needed. In other words, you would sacrifice a great deal of performance for this compatibility (the single most limiting factor of the 8-bit design...it is closely linked to the video).

On the other hand, I feel output into VGA with resolutions above 640x400 with 256 colors (not to mention text output at, or above, 80 columns by 25 rows) is worth giving up the only real special feature the ANTIC offers...display lists. While they are neat for games, they are not that significant in application programming, which this machine is primarily designed for (not to say that some real mean graphic games couldn't be written).

Keep in mind the CPU has a throughput which is over 4-1/2 times faster than the 8-bit (not counting that 16-bit transfers only take one extra cycle), and several times that of the basic 8MHz ST (which also handles all the graphics overhead).

Enclosure

To lessen my workload, and to give people a variety, the motherboard would be constructed to what is called the 'Baby-AT' platform. This is the most popular board in the PC world, and there are hundreds of case styles to choose from. There are desktop, mini-AT, mini-towers and full floor-standing towers. These all provide at least two drive bays—most provide four, and some can hold as many as eight drives.

Since PC-type floppy and hard drive controllers can be used, inexpensive storage options would finally be available. This eliminates the need for host adapters such as the ICD MIO or CSS BB which have to work within the very restrictive (not to mention slow) PBI handler/interface.

Also, standard PC-type power supplies can be used. This lets you power all of the internal components from a single, fan-cooled supply. Some of the cases currently on the market have integrated power supplies.

Estimated cost is $249.95.

Because this is only a preliminary specification, the cost is only a ball-park figure for the motherboard with no DRAM included. The number of boards which are initially made will greatly determine the cost. There are significant NRE costs associated with the PC board, which will be divided by the number of initial boards. The above estimated price reflects a cost based on 10-12 boards being made initially (that may sound low, but I will only make enough initial boards to cover orders that have deposits...more details on this later).

System #2: 130XEC

For those people who may already have an IBM/PC and would like to still use their Atari 8-bit software and peripherals, the 130XEC is the answer. This system will plug into one of the PC expansion slots and, by using software drivers, use the PC peripherals (in addition to any 8-bit Atari peripherals attached).

One possible twist of this system is that if you have a VGA monitor on your system (with a text mode of 80x48 minimum) and a 16-bit processor (80286 or above), you could actually have four of these cards installed and run four different 8-bit applications on the screen at one time! Of course, there would be some details to work out, but it would be very possible.

One potential conflict is addressing this card into the PC memory map. Most systems have more than enough free memory space to fit in a 64K block with no problems. Other systems which have LAN or other non-standard I/O cards may not have a 64K block free. If the 130XEC were chopped up into smaller blocks, performance would be degraded significantly. I would be interested in knowing what the memory map is of anyone who is interested in this system.

To gain full compatibility, it may be necessary to have a monitor which provides a composite input in addition to the normal PC TTL or Analog input. This may not be the case when the final specification is made, as it depends on how well the PC does at emulating the ANTIC display list when the video is re-directed to the PC's monitor. If it can handle it well (which I expect it will) any decent monitor/computer combination should work. This will be addressed in the final specification document.

System CPU

NMOS 6502 running at 1.79MHz to maintain compatibility with current software and hardware. Using proprietary interface techniques, the CPU will run faster than a normal XL/XE at the same clock rate.

System RAM and ROM

128K of RAM will be used, which can be banked into a 16K window at $4000, using the PortB PIA (as in the Atari 130XE CPU control mode). 16K of ROM, entry point compatible with the Atari XL/XE operating system ROM (does not support international character set or cassette) will be included.

Expansion can be done through:

One XL/XE compatible ROM cartridge port (30-pin Card Edge)

Two XL/XE compatible joystick/paddle ports (9-pin DB type)

HAYAI

For hard disk to hard disk backup and defragmentation
Copy verification with a unique compare function

Graphic Mouse/Keyboard Gem Interface
Fastest possible data transfer rates
Guaranteed to be error free
Preserves essential fat information
Trap system hardware defects

One composite video out (5-pin DIN)
One PBI expansion port (50-pin header)
One SIO type serial I/O port (14-pin header)
One language ROM socket pair (one 8K or two 4K EPROMS)

Custom Chips

Sockets are provided for the following custom chips which were made for the Atari 8-bits:

One 40-pin Antic socket
One 40-pin GTIA socket
One 40-pin PoKey socket

DataQue can provide any of these chips as an order option. The reason for making these optional is that many people will gut their original system to save the cost.

Estimated cost is $149.95. Because this is only a preliminary specification, the cost is only a ball-park figure for the card with none of the custom chips included. The number of boards which are initially made will greatly determine the cost, as in the above 1600XLE.

More Information?

These systems are both currently just in the prototyping stages. All specifications are subject to change. A current target date for completion of prototypes has been set for January 1, 1992, which is also subject to change. If sufficient interest is not shown, either or both projects may be cancelled at any time.

Once the prototypes are done, if there is sufficient demand, I will release a final specification document with costs. There will be a cut-off date assigned for initial orders, with a 25% down payment required to enter an order. Once the order period has expired, the boards will be ordered from the PC board house, and should be back within 30 days. Once boards are built up, those with pending orders will be notified and units shipped when the remaining balance is paid (or by COD).

Since a store selling PC components—both retail and wholesale—has recently been purchased by the owners of DataQue, such components will be offered for those who do not have a local source. Package deals will also be offered. Details will be made available when final specifications are released.

If you are interested in one or both of these projects, please send a #10 (large) self-addressed, stamped envelope with your thoughts and interest level. When a final specification and cost is determined, those who sent a SASE will be notified. Letters should be sent to DataQue Products, Enhanced Products Dept., Post Office Box 134, Ontario, OH 44862-0134, USA.

While I will respond to email from GEnie, Delphi and Compuserve online, I will not forward information by US mail from such contacts.

GEnie/Delphi: DataQue, CIS: 71777,3223.

44 & 88 Meg Cartridge Drives From $599 !

All Systems come ready to run for ST/TT with 1 Drive (2yr Warranty) and Cartridge, host adapter, Case, fan, Free PD software, cables and formatting/partitioning software.

Case Styles

SB - Shoebox 2 drive capacity, 7"w x 7"h x 14"d, Best case for 1040/520

UM - Under Monitor 2 drive capacity, 15"w x 3"h x 14"d, supports Mega CPU and/or monitor.

UM4 - Under Monitor 4 Slots for 2-5.25" and 2-3.5" drives, 16"w x 4"h x 16"d, supports CPU / large monitors.

MIDI Rack Professional 2 Drive shock mounted, 19" Rack mount enclosure, 3 space height x 10.5"d, black, front mounted SCSI ID switches and power switch.

Host Adapters

Supra with Clock The most options for the money for the Atari ST. Includes excellent Supra Utilities software.

ICD and ICD+ Still the standard by which Hosts for the Atari ST/TT are judged. ICD hosts come with disk caching & hard drive utilities. ICD+ hasClock.

Berkley Micro BMS Fastest throughput available for ST. Add $10 to ICD+ price.

Dual CPU

Internally mounted switching system to use one SyQuest Drive on two or more different computers. For the Atari ST/TT, Macintosh, PC/XT/AT/386/486, SCSI compatible MIDI Device, or an Amiga

SQ44 & SQ88

44 Mb or 88 Mb 20Ms Cartridge Drive + Cart

Add $330 to system price for 88 Meg Drive with 88 Meg Cart or $499 to system price for 90Mb Bernoulli w/Cart in place of 44 Meg & cart.

SBs	Shoebox, Supra Host	$599
SBa	Shoebox, ICD Host	$640
SB+	Shoebox, ICD+ Host	$651
UMs	Under Monitor, Supra Host	$649
UMa	Under Monitor, ICD Host	$671
UM+	Under Monitor, ICD+ Host	$682
UM4	Same Price as Under Monitor	
MIDI	Rack mount, SCSI ID, ICD	$852
MIDI+	Rack Mount, SCSI ID, ICD+	$864
MIDIxh	External Host, 10ft cable	$1,019
CS+	Smallest Syquest For Atari ST	$687

Dual CPU

With SCSI ID, SCSI Port

SBd+	Shoebox, ICD+ Host	$862
UMd+	Under Monitor, ICD+ Host	$896
UM4d+	Under Monitor 4 , ICD+ Host	$898
MTd+	Mini Tower, ICD+ Host	$909
MIDId+	Rack Mount ICD+ Host	$996
SyQuest 44 Cart's		$78
SyQuest 44 Drive		$365
SyQuest 88 Cart's		$147
SyQuest 88 Drive		$629

ST Hard Drives

65 Meg $389 !

Ready to run for Atari ST/TT, Seagate 28Ms unless noted. Add: $31 for UM or UM4, $23 for ICD, $34 ICD+,$44 for BMS host, $212 for Rack case, $69 Compact

SB49s	49 Meg, SB, Supra Host 40Ms	$349
SB65s	65 Meg, Shoebox, Supra Host	$389
SB85s	85 Meg, 28Ms, SBCase, Supra	$519
SB340+	340 Meg 3.9Ms, SB, ICD+	$1,520

Bare Drives and Complete ST Systems from 20 - 2200 Megabytes, 40 to 3.9 Ms Seagate, SyQuest, Bernoulli, Conner, Micropolis, Maxtor, Quantum, CD ROM & Read/Write Call for price quotes.

65 Meg HD $229

POWER COMPUTING

Atari ST Owners!

Put Power into your cartridge port

Ultimate Ripper

$99.95

The cartridge your ST has been waiting for!

Breaks into any ST program • Fits easily into the cartridge port • Powerful Tool for all Atari ST users

Whether you are a programmer, hacker, gamesplayer, or just curious about the workings of your Atari ST, the Ultimate Ripper gives you the power that you need.

Just look at the features...

• Break into any program • Read Memory • Search Memory • Print Memory • Disassemble • Disassemble to disk • Edit Memory • Search for graphics • Search for Sprites • Edit screen Configurations • Set up colour paletts • Alter Plane configurations • Load and save Screen Displays • Run external TOS programs • Load TOS Programs • Load and Save graphics screens • Low Level Disk Editor • Disk Analyzer • Examine formats • Format analyzer • File Editor • Directory Editor • Formatter • Break & Restart function • Search forinfinite lives • Look for music • Play music • Load and save music • Search for soundtracker music • Search for Soundsamples • Programmers Calculator built in • Many more features • Updates available with new software • Full support for STE sound & graphics

Dealer inquirers welcome

AAAUA ATARI 8-BIT USER GROUP

AAAUA Presidential Ponderings

It has been said that the only thing that remains the same is CHANGE. That certainly applies to computer technology and consumer demand. It's interesting that the latter is more what people THINK they need or want than what they ACTUALLY need or want. Why is that? It's called marketing. Else, how can you explain Nintendo, Teenage Mutant Ninja Turtles and Bart Simpson!

In the computer world, new developments and better (different?) software entice the consumer. Advertisers do their best to convince the public that they just HAVE TO HAVE this NEW and IMPROVED "whatever." Many who respond to this psychological pressure do so for reasons other than "need." Frequently, it is just plain "keeping up with the Jones." Or, it could be an insatiable desire for the latest "gadget." Yes, I am guilty too. And I suppose it isn't all bad. Otherwise, technology would lose a lot of its impetus. But, how does this relate to user groups?

When user groups first sprang up about ten years ago, their primary function was to share technical information, which was not generally available or was difficult acquire. As technology continued to explode, users along the way found themselves with obsolete machines and dwindling support. Many users continued to pursue the neverending "Pie in the Sky" to have "the very latest"; others stood staunchly behind their computers, which were still every "bit" as capable, perhaps moreso, as the day they bought them. Meanwhile, most manufacturers abandoned the old in pursuit of the almighty dollar. Please don't misunderstand. Progress must progress.

But I do believe the prudent manufacturer will have the foresight to continue support for his loyal customers. Or, guess what? The loyal customers will become ex-loyal customers. So, assuming we choose not to join the masses in the neverending pursuit of the ever expanding technology, what is the lesson for us "ordinary" folks and user groups?

First, recognize reality. Many users will be responding to various pressures (or perhaps needs) and moving on to more advanced machines. Some of us will continue to think for ourselves and choose a machine that meets OUR needs. If you happen to have chosen an Atari 8-bit and it still meets your needs, why change?

Now the good news. While the majority are scrambling to have the latest, they are leaving in their wake thousands of machines and software for us loyal users to scarf up at rock bottom prices. Today, we can buy hardware and softare at 1/4 to 1/5 the original prices, and sometimes less. And while they may not be readily available at the corner computer store, there are several excellent mailorder sources nationwide. Or we can trade amongst ourselves. Moreover, there recently has been a surge of 8-bit interest and coverage in the publications. We eight bit users never had it so good!

Perhaps one day we will choose to "move up." But, when that day comes, where is it written that we must sell our historical CLASSIC 8-bit? So, 8-bit Atarians, rejoice; and keep the faith!

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN generally meets at the Shawnee branch of the Allen County Public Library on the first Saturday of each month beginning at 10 AM. For additional information please contact Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815 or call our BBS at 744-1396 (300 to 9600 baud, F-Net node 678).

Notes from the August Meeting:

Mark Garrison demoed his Gravis Mousestick which can be used as either a mouse or a joystick. It is programable and very versatile with a list price around $100. Mark demonstrated it with MIG-29 and highly recommends it for cad and drawing programs. (Even works fine with a Mouse Master.) Scott Schaffer demonstrated DOS-XE for the 8-bit Atari computers. Mike Surface demonstrated Midwinter II: The Flames of Freedom which is a spy-mission simulator with awesome detail. A copy of Hot Rod was donated as a door prize by Computer Corner and was won by Jim Barnes.

Business Meeting: A reminder that the October meeting will combine ACORN meeting with the IEEE meeting. The focus of the meeting will be high performance, low cost alternative computers including demonstrations and discussions of telecommunications, word processing, data bases, etc. Several computers will be set up and demonstrating different software packages. A pizza party mixer is planned at the local Pizza Hut after the meeting. Several members shared their impressions of the MIST Atarifest including the latest news from Bob Brodie.

We were told that Bob Frasher passed away July 30. Bob was an active member of ACORN for several years and he will be greatly missed. Bob helped out at most of our special events and enjoyed demonstrating how to use an ST and a synthesizer to make music. Bob left behind a wife and three children. ACORN members interested in contributing to the trust fund set up for his children's education should contact Kim Stahn.

The end of the year promises to be very busy with the joint ACORN/IEEE meeting and ICE in October; Pentacon and the big Atarifest in Chicago in November; and December will be nominations for next years officers.

Notes from the September Meeting:

Discount subscriptions to Atari Explorer are available if you are a user group member according to a letter we received. We now have to pay shipping costs to continue receiving Atari User magazine. We will see if Computer Corner wants to split a shipment of 100 copies and save some money. If not, we will purchase them on our own.

Demonstrations at the meeting included PageStream 2.1 for the ST by Ken Helms and The Writer's Tool v2.25 for the XL/XE by Eric Converse.

Several members are making plans to attend Atari's Computer Show in Chicago in November. The group intends to purchase a block of 20 tickets and make them available to members at cost ($4 each) on a first-come first-served basis.

ACORN

Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, 1150 Winton Road South. Our general meeting starts at 7:00pm in room 262S, with a split into ST and 8-bit SIGs at 8:30pm.

ACORN has both an 8-bit and ST PD software library. Over 300 8-bit disks and over 100 ST disks are available to any individual. We operate the Dimension's End BBS at (716)436-3078, 300/1200/2400 baud, 132 MB of online PD and shareware files. Membership in ACORN is not required to access the system.

Membership in ACORN is $20/year, plus an extra $6/year to get AIM. Membership includes a year's subscription to both the ACORN Kernel newsletter and AtariUser magazine, 12 meetings, access to our PD libraries at a reduced cost, and special access to the BBS. Our mailing address is: PO Box 24920, Rochester, NY 14624.

President Don Allis (716)293-3415
Vice Prez Joe DePierro (716)223-7838
Secretary Chris Freemesser (716)328-1703
Treasurer Sam Duck (716)461-0544

ASTMUM

ATARI ST/MEGA USERS (Montreal)

Our users' group consists of MIDI musicians, composers, videographers, artists, writers, technicians, students, teachers and business people. We also welcome new members interested in learning about the ST/MEGA models and their applications before purchasing.

Founded in 1987, ASTMUM has provided its productivity-oriented members with technical support, training and emergency assistance (24-Hour Repair Hotline), as well as discounts (through participating dealers) on original software, computer hardware and music industry-related equipment.

To benefit its members, and the visiting public, our group has participated in these shows and expositions:

CEGEP Rosemont AtariFest, Montreal, September '88
WORLD OF ATARI, Dearborn, MI USA, June '89
PRODUCTION '90, Montreal, May '90
SIIM '90, Montreal, June '90
Windsor/Detroit International AtariFest, May '91
PRODUCTION '91, Montreal, June '91
SIIM '91, Montreal, June '91

We have kept our members informed of Atari's progress on their most recent models (TT, MEGA STE, ST Notebook and ST Pad) through our large periodicals library, videotaped show-tours and interviews with software and hardware developers.

Encouraging members to form special interest groups, we hold monthly meetings (usually the last Sunday of each month) and offer seminars and demonstrations.

Membership information may be obtained by writing to:

ASTMUM, Attn: K. Carter-Morgan, P.O. Box 966, Station B, Montreal, QUEBEC, Canada H3B 3K5 or by phoning (514) 272-6631 (voice only).

Executive Exhortations by Kest Carter-Morgan:

This magazine is getting to be (nicely so) a compendium of users' groups and their positions on controversial topics, their helpful activities and their future direction.

I'd like to tip my beret to Robert Pecora, of CACE, for his article "The Great Piracy Questionnaire" (AIM, March '91). It should be required reading for computer users of all platforms, as well as Atari users everywhere.

Club officers, handling memberships, have often heard "If I join your club, can you get me a 'free' copy of 'blah-blah' program?" or "I have a copy of 'blah-blah' program, but no manual. Can you teach me how it works?" If good judgement is employed, a member's response to such tactics can avert disaster for the club and preserve the member's reputation.

Since most of us use (or intend to use) our computers to earn our livelihoods, we make a point of showing applicants that our club is not a haven for software pirates. Our number-one rule forbids copying of commercial programs at meetings, or dissemination of information that could direct or induce members towards a software pirate. Instead, we make quantity purchases of original software, directly from authors and participating dealers, thus demonstrating that there are cost-effective alternatives to piracy. Remember, an author would rather negotiate a fair price for his software and have his users REGISTER, than lose sales and be kept in the dark -- wondering how many people are making use of his intellectual property.

A BBS requires dedication and work to keep it devoid of commercial software. We would rather not have a BBS at all, than have one that puts the intellectual property of software authors at risk. However, positions are open for a pair of well-principled individuals to develop and maintain a members-only, training-wheels BBS, on which beginners can make mistakes without fear of derision or impatience from others. As we gain more expertise, we hope our BBS will evolve into something to be proud of and STAY proud of!

Once again, we'd like to thank Mr. Pecora for his stimulating article!

The Chicago AtariFest is edging ever nearer. We intend to be there and would like to hear from other groups and developers planning to attend. This time, I hope we'll have a larger team to both manage our booth and document the show. It would be great to organize some social activities as well!

Adieu for now!

If anyone asks, tell 'em you saw their ad in AIM!

CUSTUG Champaign-Urbana ST Users Group

The Champaign-Urbana ST User's Group (CUSTUG) meets at 7pm on the second wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race streets in Urbana, IL. Membership dues include a subscription to AIM and ATARIUSER magazines, as well as access to our PD software library. All who are interested in the ATARI ST & TT computers are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

Lee Johnson President
Menno Rapson Vice-President
Bill Magro Secretary/Treasurer
Tim Brumleve PD Librarian
Contact address: CUSTUG, PO BOX 3442, Champaign, IL 61826-3442

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle GA Atari Users Group is the sole Atari Club in the Middle GA area. We are composed of 40 members of which approx. one half are ST users. Club president Pete Miller can be reached by phone at 912-328-8758. The M.G.A.U.G. address is 115 Feagin Mill Rd., Warner Robins, Ga. 31088. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $5 with the newsletter optional. Use of the club library is free to all paid members.

OCTOBER MEETING

The October meeting kicked off at the usual time. Turn out was good with three members from the Atlanta ST users group including their president showing up at the meeting. We are glad that they decided on the 100 mile trip to attend our small meeting. Bob Blackshear was nice enough to bring his computer to the meeting which was a boon in that we had some lively discussions.

Atari has a lot of things on the horizon but whether that will help Atari U.S.A. is still a toss-up. The TT is supposed to shipping at this time with the 32Mhz clock instead of the 16. It will also have an extra bonus in a new desktop that has a lot of features found in NeoDesk. Speaking of NeoDesk, Atari Canada, is offering several bundles of software including NeoDesk.

The Atari CD ROM has finally been released to the public for under $600. Two Atari disks have been released including a disk of Public Domain software and a disk of Clip Art. Atari is also selling a 520STe in Europe, no news if or when it will be offered in the U.S. Atari is also marketing a new monitor to take care of the STe's sound. The new color monitor will have stereo and is an entirely new monitor.

On the software front we have some new software that promises to be a boon on the Atari front. M1 Tank Platoon from MicroPose will be released soon and should be a must have for Strategy gamers. For Wargamers there are two new releases that may be of interest, Universal Military Simulator 2 and Halls of Montezuma are for hard core Wargamers only. Also for strategy of a different type there is SimCity for the city or for an enhanced Populus type of game there is PowerMonger.

We had the drawing for ACCESS at the meeting and Jeff Vincent was the lucky winner. ACCESS is a program called a command line interpeter that gives you an IBM style command line and also offers Batch Processing. Another ACCESS program will be given away at the NovemAtari has a lot of things on the horizon but whether that will help Atari U.S.A. is still a toss-up. The TT is supposed to shipping at this time with the 32Mhz clock instead of the 16. It will also have an extra bonus in a new desktop that has a lot of features found in NeoDesk. Speaking of NeoDesk, Atari Canada, is offering several bundles of software including NeoDesk.

The Atari CD ROM has finally been released to the public for under $600. Two Atari disks have been released including a disk of Public Domain software and a disk of Clip Art. Atari is also selling a 520STe in Europe, no news if or when it will be offered in the U.S. Atari is also marketing a new monitor to take care of the STe's sound. The new color monitor will have stereo and is an entirely new monitor.

Also at the meeting was LEE MAVITY with his new 85 Meg hard drive from D&P Computers. The hard drive featured an under the monitor style case and has a clock, fan and room for an additional drive. One member said that the case was an old ATR8000 case from the Atari 8-Bit days. All this for under $600 - a great price. If you are thinking about a hard drive you may want to give D&P a call.

The next meeting will be on December 9th at the library at 1 PM. I hope to see you there and Why don't you bring a friend.

The Prez Sez by Rick Reaser

We've been selling lots of blank disks at the SIG meetings. New 5 1/4 inch disks are available for 25 cents each, while 3 1/2 inch disks are available for 35 cents each. Pick up yours at the meeting or give me a call. We bought 100 5 1/4 disks and 500 3 1/5 inch disks. Additionally, Terry Quinn has donated a large number of used 5 1/4 floppies to the club which we are using for the AIM Disk of the Month. By the way, the ST and 8-bit AIM Disks of the Month are always available at the SIG meetings.

Remember that for you modemless members, the club has a loaner Hayes 300 baud modem and an Atari SX-212 1200 baud modem with cables that you can check out. The

SX-212 can connect directly to both 8-bit and ST computers.

Chris Smith's Last Castle (390-9837) is temporarily down. Another BBS worth checking out is Pinnacle (599-9059). Pinnacle has been advertised in the Gazette Telegraph computer want ads lately. It is principally an Amiga board and appears to be run by Paragon Computers (where our club library is normally located). Be sure to check out Maggie's Place (531-5531) which is the public library's BBS. Finally there is a BBS in town that deals with real estate (260-6475).

We've started to mail out little postcards to remind members of upcoming meetings and events. Hopefully, you have been receiving them. We also are putting announcements on the Cable TV Bulletin Board and in the Gazette Telegraph Community section. Be on the look out for our publicity efforts.

Remember that in order to get your free Atari User Magazine, you must come to a SIG meeting. We even have back issues if you missed a meeting.

At the September 8-bit SIG, we demoed the various cartridges available at the Children's Palace fire sale. It was a blast. Roger Meston showed us total domination in Donkey Kong. I never knew that there was more than one screen. Roger also showed us how to play Hardball! He must have cheated and read the instructions. We stopped the meeting early (a first for the 8-bit SIG) and headed over to Children's Palace. We reorganized all the 8-bit stuff onto a single display and found a bunch of stuff. At least 20 cartridges were purchased between the six of us who made it over there.

Your's truly has been asked by the Current Notes 8-bit editor, Ben Poehland, to review a new 8-bit 3-D graphics modelling program. I should get the disks shortly and will run through it at a future 8-bit meeting. According to Ben, there are several new 8-bit products out and reviews should be coming out shortly.

At the August ST SIG, Linda Cullum did an outstanding demo of the ST's Musical Instrument Digital Interface (MIDI) capbilities. She brought a Proteus synthesizer with a Casio keyboard. It was outrageous. The software demoed was Dr T's Tiger Cub and KCS Omega. Another neat program was Band in a Box. We had a heavier than usual turnout and those of you that missed the meeting really missed out.

Be sure to let us know if you change your address so you can continue to receive AIM. The post office isn't real good about forwarding third class mail. Also, please check your mailing label to see if your dues are up and get paid up.

See you at the next SIG meeting.
Rick Reaser, P3ACE President

R.A.C.E.

President Lewis Midyette 828-4319
Vice President Eric Schofield 851-5134
Secretary Don Nelson 942-2764
ST Librarian Tony Manino 851-8092
8-bit Librarian Arthur Katz 880-2047
Treasurer Jim Harrop 851-5134
BBS SYSOP Robert Yates 552-7053

This is Tony Manino, your ST Librarian, and another W.A.A.C.E. AtariFest has come and gone, and boy did we have fun! As always, there were good deals, much to see, and many cool people to meet. Those of you that weren't able to attend will have to make a special effort to get there next year. It's a blast, guys!

Something else you won't want to miss is our annual Christmas banquet. Last year's was held at O'Charley's, and it was packed with food, fun, and prizes! We're having a repeat performance on December 16, so write it on your calendar and BE THERE! That'll be O'Charley's Restaurant in Cary off of Tryon Road. We'll have a nice Christmas get together, and we'll be giving away free software! Check the club BBS for more specific information.

If you ever have any questions, feel free to give an officer a call, or get together with someone at the meeting. Hey, that's what we're all about... getting the best use out of your Atari, and having a lot o' fun!

November's meeting will be on the 19th or 20th. Please check the BBS for final details on this matter. NOTE: ALWAYS check the BBS for final details about the club meeting since this is our hub for information in R.A.C.E. If there are any changes, the BBS will inform you about the changes. See ya at the meeting gang!

SALSA

ST Atari League of San Antonio

ST Atari League of San Antonio (SALSA), P.O. Box 18731, San Antonio, TX 78218.

SALSA is a users group for 16 bit Atari users, but also supporting the next generation of Atari computers: Mega STe/TT/Lynx. Meetings are held on the second Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, TX, from 7:00PM to 10:00PM. Special events are held from month to month depending on interest. New user classes are held each month to help users to learn the best ways for traversing the GEM environment.

Membership dues are $20.00 per year and members receive AIM as well as the option of recieving the clubs newsletter. A one year membership without AIM is $15.00 and includes the clubs newsletter. A subscribing membership is available to those not able to attend meetings and includes the clubs newsletter and all discounts available to normal members. A monthly Disk of the Month is available at each meeting for $2.

SDACE News

It's September 15th as I write this and the Glendale Atari Show sponsored by HACKS just ended. I spent a full day at the show, looking at all the latest gadgets (or GADGETS as the case may be) and I managed to spend several months worth of "discretionary" funds upgrading many programs as well as in picking up some new products.

The show was well represented by most of the big name Atari developers and programmers, and there were a few major new products making their debut. The consensus was that the crowds seemed smaller than in years previous but an official count has not yet been released. There appeared to be a steady stream of cash changing hands so many venders should have done quite well.

There were TT's everywhere - virtually every booth had at least one TT and a Mega STE as well. Unfortunately, there weren't any readily apparent for sale. Additionally, none of the anticipated new products such as the ST Notebook were shown. Bob Brodie was forced to leave the show early due to a family emergency but he was kind enough to donate (for Atari) complete Migraph Touchup and Scanner packages to all participating user groups. That kind of thoughtfulness buys a lot of good will.

While the smaller crowds in attendance than in years past would seem to confirm Atari's inexorable slide into oblivion, new developers are producing exciting new products for the Atari series of computers thus ensuring their utility for years to come. Rather than close the chapter on the Atari, this show, at least for me, confirmed that there is life after "games." Almost without exception, the developers and retailers who demonstrated their products at the show were aimed squarely at the "utility" and "performance enhancement" side of business. This indicates to me that there are still a lot of people who take their Atari's very seriously. I welcome this shift in attitude and hope that it bodes well for the future.

If you are in the San Diego area, please feel free to join us at any of our meetings.

SPACE, the Southcentral Pennsylvania Atari Computer Enthusiasts meet on the third monday of the month at the Camp Hill Mall Community Room. The doors open at 7:00 and the meeting begins at 7:30. Dues are $15.00 per year and include a subscription to AIM and SPACE Probes, our official newsletter.

SPACE was founded in 1982 and is still going strong. We support both ST and 8-bit computers.

For more information, call either John Slade, President at (717) 938-3656 or John Hileman, Newsletter Editor at (717) 938-8753 or write to: SPACE, PO Box 11446, Harrisburg, PA 17108.

Here is a list of upcoming meeting themes:
October 21 - The public domain
November 18 - Music and the Atari
December 16 - Christmas Party and Game Night

STAG Saginaw / Tri-City Atari User Group

"where the deer and Atarians play"

The Saginaw/Tri-City Atari User Group meets the 2nd Saturday of the month, at 9 am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township, Michigan. Upcoming meetings are September 14th, October 12th, November 9th, December 14th 1991, January 11th, 1992, and February 8th, 1992.

President Bryant LaFreniere (517)835-2234
ST Librarian Jim Fleming 793-9792
Treasurer/Secretary Marty Schmidt 792-6029
8 Bit Librarian Ted Beauchamp 686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's Public Domain library, along with a year's subscription to the Atari Interface Magazine. PD disks are $3 for a double-sided disk packed full of goodies (2 for $5, what a bargain!). Check your mailing label, if you need to renew, (or haven't joined us yet!). A free PD disk is included with each new membership or renewal! DO IT NOW!

At The September Meeting:

We discussed the newest developments of the Atari Interface Magazine (AIM) and everyone was in good agreement that the new format change was good, especially for the fast delivery of our club news. With the use of postcards to send information to our members before the meeting, we have good communication of our activities to our current members (even without AIM).

Important Note:

We are going to have our meetings on the 2nd Saturday of the month (not the last Saturday before the 18th) to make our scheduling more consistent. The only reason we had the weird scheduling was to make it easier to receive AIM before our meetings. Since we are not receiving AIM before our meetings anyway and the postcard program is communicating our meetings to our members sufficiently, we will go back to the consistent schedule (2nd Saturday of Month). Nelson, Bryant, and Hank will contact Bay City, Midland, Saginaw for announcements to be put in the calendar sections of the respective papers to remind current members and hopefully bring notice to new members about our club. The postcard that will be sent to you before the meeting will reflect the new change.

At the September meeting, the 8-bitters out-numbered the STers (6 to 3) for the first time that I have ever been going to our meetings. That is a good sign that the 8-bits are alive and well. Unfortunately, that also means that the STers need a lot more participation if we are going to have productive meetings for the ST. A new 8-bit member, Roger Pavlawk, had joined our club. Welcome, Roger. The new magazine, AtariUser, that we should be getting free has been shipped to our old president's house. He has supposedly been dropping it off at Simply Software in Bay City. I will try to correct the mailing problem so I can bring the magazine to our meetings from now on. The 8-bitters demonstrated the newest 8-bit AIM disk and the programs, MINIATURE GOLF and GAUNTLET. They will continue to look at the 8-bit disk and any special request from their 8-bit members. The ST group looked at WORDFLAIR II, a word processing program from Goldleaf. The newest GDOS, FSMGDOS, should have been in by that time, but due to numerous delays it has not arrived at anyone's home. Nevertheless, WORDFLAIR II was shown.

It appears that WORDFLAIR II is not compatible with QUICK ST. The program bombs on saving a file and the screen appears distorted (top and bottom of the document is seen on the same screen). WORDFLAIR II does have some nice features such as the use of GDOS fonts and the new FSM GDOS fonts. You can have designated areas (boxes) on the page that is dedicated to certain functions (text, math, graphs, images) that can use the information between them. For example, changing a number in a table at the top of the page can change a graph on the bottom of the page. Mail merge can be easily accomplished with record files. An user-friendly dictionary and thesaurus is also included. Although there is another program, WORD PERFECT, that has other functions not associated with WORDFLAIR II, I hope that with the continued updates to WORDFLAIR II (the company is continuously improving the product), that this program will be the direction that word processing will continue in the future.

In OCTOBER:

At the October 12th meeting, we will look at the various public domain software that we have for the ST and 8-bit in our library. As soon as a member receives the newest GDOS, FSM GDOS, there will be a demonstration of it with WORDFLAIR that will show you the power of ultimate word processing. Marty Schmidt (monitor) and Jim Fleming (ST computer) will be the equipment volunteers for the ST in October. 8-bitters should contact Ted Beauchamp for the agenda for the 8-bit section of the club. Also, all members should be thinking of the Community Fair at Fashion Square Mall in Saginaw the first weekend of January 1992. We need participants to make this show a success.

STANCE

President Chris French 221-5705
Vice-President Jim Jensen 366-5181
Treasurer Kathi Koenig 892-0881
Disk Librarian Joseph Adato 449-6881

The ST Atari North Coast Enthusiasts (STANCE) is an independent, not for profit, Atari computer user group and is not affiliated with Atari Corporation or any of its affiliated in any way.

Dues are $12.00 per year with a one time $13.00 sign up fee.

STANCE club meetings are help every third Monday of each and every month at B & G ELECTRONICS (located at 15729 Madison Ave. Lakewood, OH 44107) starting at 7:15 P.M.

WAUG

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 PM in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor MI.

Club dues are $15.00 per year and provide access to the PD library and a subscription to AIM magazine. Meetings feature demos of both 8 bit and ST hardware and software. Non-members are welcome to attend and questions are invited. Officers can be contacted by calling Craig Harvey at (313) 971-8576 or by calling the MOlin's Den BBS at (313) 451-0524.

The August WAUG meeting was opened at 7:30 PM by President Dave Brzezinski and launched immediately into a general discussion of club hardware purchases (we're still looking). Pattie Rayl of AIM magazine then showed off the new "club meeting minutes" insert in the magazine and asked for members commentary.

8-bit Librarian Dick Selke passed out a description of the latest AIM 8-bit disk-of-the-month and also a PD basic tutorial disc and a three disc package of The New Aladin Magazine.

Ken Antkowiak was up next with a review of an ST program,Wordflair II "the document processor" along with the Codehead's Codekeys. Ken passed out a printout of the WAUG July minutes to the membership to demonstrate the quality of printing that could be expected from this program. While the membership examined the printout, Ken went on to explain some of the hardware requirements for running this program on an ST. The program requires at minimum 1 meg of memory and 2 double sided drives and will run in either color or mono. The addition of 2.5 meg of memory will allow the use of more fonts and a built in help system and a hard drive is recommended for increased performance. He also commented that Wordflair II was capable of up to 9 columns of print with margins set anywhere you might want.

Wordflair II presently uses GDOS for font technology, but Ken explained that it is already set up to use the new FSMGDOS when it becomes available. Graphics, which are loaded from the disk separately, can have their aspect ratio preserved or not as a user preference. A demo of the spreadsheet and database capabilities of Wordflair II by setting up resizable regions within a document and entering the data was also illustrated by Ken. He went on to inform us that page numbers could be entered anywhere on a page and gave us a short description of the rudimentary drawings tools and the modifiable spell checker included with this program.

Does he like like Wordflair II? Yes, he said that he used it frequently and was very pleased with the included manual. The only minor complaints that Ken expressed were the slow speed of the program using GDOS and the fact that it occasionally crashed for reasons unknown to him.

Ken's next demo was of a program from Codehead Software called Codekeys. Actually, he was using Codekeys to bring up demo screens in Wordflair II. Codekeys can be used to set up an automatic macro to be run at the start of any program and any of it's macros are fully editable by the user. Ken went on to set up a macro to demonstrate how easy it was to do and commented that there were probably more features to this program than he could ever use. Several of the other members using this program commented they they too found it useful and easy to use. About the only thing that Codekeys was unable to do was to hold a left mouse button press, but with so many other features Ken was sure that anything like this was a very minor flaw.

Our ST Librarian, Mike Olin, then made his appearance with a fistful of new library disks including a new library catalog disk and 2 new AIM disks-of-the-month. His description of the contents of these discs impressed one and all that they would be a valuable addition to any STer's library.

Our monthly free raffle was held with all present participating and the lucky winners being rewarded on the spot just before adjournment of the meeting at 9:30 PM.

WAUG GENERAL MEETING MINUTES SEPTEMBER 10, 1991

The September WAUG meeting was opened at 7:30 PM by President Dave Brzezinski in his usual inimicable manner. The first order of business was the Treasurer's report by Russ Crum. Russ dutifully informed us that our treasury was in great shape (over $2000.00) even after spending some $1440.00 on club hardware in August. President Dave B. thereupon again took the floor to announce the prizes for our monthly free raffle and to make a pitch for new membership.

The unveiling of our new club hardware was presented by ST librarian Mike Olin as he assembled the new Syquest 44mb drive from Westcomp Electronics in Westland Michigan with an ICD host adapter into it's case. The enclosure that we chose was from D&P Computer Products of Elyria Ohio and was an under monitor style complete with power supply and fan, cables, up front switch and room for two half height devices. The assembly of the unit was easily accomplished (Mike cheated, he already had it together once) and members began to ask questions about the drive's speed, performance and price.

Unfortunately, the assembly of our 8 bit hard drive system did not work out quite as well. The hardware for this unit was all bought used at bargain basement prices except for the K-P (Supra) interface. Mike had also assembled this set up beforehand and determined that all the hardware was functioning properly with his own ICD 8 bit interface. In spite of the best efforts of Mike and 8 bit librarian Dick Selke, they had no luck in getting the K-P interface to respond properly so back it goes for replacement or revision. Several 8 bit members then commented and asked questions about the merits of different 8 bit interfaces regarding their respective prices and features.

It was then time to put our new 4 meg 520STE from Team Computers of East Detroit Michigan to work with our new ST hard drive and a Panasonic C1391 Multisync monitor and Omniswitch. Dick Selke was kind enough to bring his own personal monitor for the demo. He explained the fact that he had carefully chosen this particular model for its ability to correctly display all three ST resolutions with only one screen. The system was all connected and up it went as intended. Mike demoed the club Syquest drive and even showed how the cartridges could be swapped on the fly without rebooting, thereby giving any ST virtually unlimited storage capacity.

Our ST librarian managed to drag himself away from the new toys long enough to present the club with a plethora of new disks loaded with software for every taste. The AIM disk with more DC utilities, Pagesteam fonts, a game demo, Fortran language program, a resolution enhancer, database, hard drive utility, mouse accelerator, an educational program and more looked like all that could be asked for.

Not good enough for Mike though. He then presented us also with an entire disk of pre-school educational programs, three full disks of games from the UK, a business applications disk that included twenty seven Pagestream fonts with an editor, a disk of statistical programs, and a utilities disk starring a Pagestream print speed-up program.

Not to be outdone, the 8 bit library took the stage with Dick showing off the AIM 8 bit disk-of-the-month, a valuable offering featuring two Bible verse games, a TextPro mail merge, RGB Paint (a 4096 color paint program on the 8 bit?), Space Gauntlet, a Kermit protocol, and a Printshop to Daisy Dot conversion utility. The disk from our own 8 bit library this month was an adult game disk with graphics that Dick said he would have to see an ID with proof of age before sale. The graphics are that good?

Questions about any ST or 8 bit topic were solicited from the assembled members as our President prepared for the monthly drawing. A copy of DREDIS, a new 8 bit game from Software Infinity, went to the lucky 8 bit winner with a copy of Menu Plus going for the ST.

After very brisk sales of both ST and 8 bit disks, one last bit of business was conducted before our adjournment. The members voted unanimously to instruct the secretary to convey our thanks to Mike Drysdale of Team Computer for his help and support.

Respectfully submitted,
Dan Cable, Secretary

President Mike Husband
Vice President Kevin Packard
Treasurer Dave Shane
Secretary John Kasupski
WIZARD'S ATTIC BBS (716) 681-1654

Minutes of August 1991 Meeting

Although we cancelled our July meeting because of the Independence Day holiday, our "off" time was productive as we gained two new members, Douglas Tolkacz and Christine Hess.

We also released the first POKEY Newsletter Disk and, as with any new undertaking, a few problems were reported: At the meeting we repaired a few disks (Side 1 wouldn't boot on some members' disks). In the future each copy of each disk will be booted before distribution to make sure this doesn't happen again. Also, from now on members who attend the monthly meeting will receive their disks at the meeting. We will mail out the rest of the POKEY disks a day or two after the meetings. The reason for this is twofold: (1) It will help reduce mailing costs, and (2) Members who attend meetings will benefit by receiving their disks a week or so ahead of those who don't!

If anyone else received a defective POKEY disk, please contact Dave Shane at 875-5350 or leave E-Mail for DOC on the Wizard's Attic to let us know so we can arrange to fix things up.

Dave reported that the club's hard drive and controller card have both bitten the dust. Therefore, we are now seeking a donation of a 20-30 Meg full-height 5-1/4" MFM drive, to go along with the spare MFM controller card Dave's willing to let us have cheap. If anyone reading this, company or individual, would like some good publicity and the eternal gratitude of the WNYAUG, here's an opportunity to do a good deed for a local users' group by donating or offering a real good deal on a hard drive that we sorely need.

The reconstruction of the WNYAUG Software Library is very nearly completed. There is some EXCELLENT stuff that's been added to the library during this process. This means that from now on our club Disk Of The Month will be all NEW stuff. It also means that if you're looking for a PD/Shareware program, you might want to check our library first before you go hunting all over the place...you might be surprised what you'll find right in your own back yard!

Kevin handed out a list of 8-bit software available from the CHOICE Computer Centers Computer Outlet in Arden, NC, where he was on vacation. There was a nice mix of games and educational titles, available in limited quantities at rock-bottom proces. I for one plan to take advantage of this. Thanks, Kevin, for bringing this information back to the group!

Kevin also reported that he has been in contact with Jones Cable regarding production by WNYAUG of a public service video about Atari computers and our group for broadcast on their public access channel. This has to be more of a documentary than a commercial, for obvious reasons. For those interested, the first thing we need is a script.

Mike then demonstrated the mods he made to the POKEY Newsletter Disk program, inluding the addition of a jingle, and the mods to the DIPCHIPS.PIC file he did for the newsletter. Members are reminded that the POKEY Newsletter Disk is still considered to be under development. In other words, if you can improve the program, by all means do so. This is YOUR newsletter, and anything you can do to make it better will benefit all of us!

Mike also demonstrated the difference in speed between Turbo BASIC and Atari BASIC by running the same program in both languages. The D.O.M., a collection of graphics utilities and demos programs from the WNYAUG library, was also demonstrated.

A split club drawing was then conducted, and Doug Tolkacz was the winner. Imagine, a NEW member attending his FIRST meeting won the split club jackpot! Next time, it could be you, so plan on attending the September meeting. As they say, ya gotta be in it to win it!

August 3, 1991, John Kasupski, Secretary

MIKE MODEM MODULATES

by Mike Husband

Elections at the WNYAUG. "Election" is a very deceiving word to use...it comes down to whomever raises their hand first, gets elected. We're still waiting for someone to raise their hand for Vice President. I always compared the elections of the WNYAUG to those in Russia: Once elected to a post it's a life nomination. I volunteered for Vice President & ended up President. It's kind of nice to be in a group where you can move your way up the latter. The only way out is to stop going to the meetings or die. If any member wishes to be Vice President PLEASE CONTACT ME!!!

As I was reading my April/May AIM, I noticed that a lot of the 8-Bit Clubs were re-organizing their libraries. We have been re-organizing our library too. It might be a good idea to contact these clubs and see what is in their libraries.

I am working on a new emblem for the Club. The picture of the disk with WNY-the Atari Emblem-UG is kind of dated. We don't do anything without voting on it, we will take a vote on this too.

We will be getting the membership drive started soon. Maybe we will have a new Vice President after all.

For Sale
Wrath of the Demon from ReadySoft. Excellent game with good graphics and stereo sound! Still shrink-wrapped. $15

Falcon Mission Disk II, from Spectrum Holobyte. Shrink-wrapped. $10

Ultimate Ripper

Bill & Pattie Rayl

Our first impression upon seeing the recent advertisement for the Ultimate Ripper from Power Computing was "Oh no, not another pirate's tool!" The ad starts off saying "Breaks into any ST program."

Reading further into the ad, we noticed the Ultimate Ripper had a number of features useful to many ST owners and one in particular that we have literally been begging for—the ability to save graphics out of copy-protected games. As publishers of this magazine, there have been numerous occasions when we have wished for the ability to get screen snapshots of protected games.

The Ultimate Ripper cartridge makes it fairly easy to not only remove graphics from games, but it also allows you to rip out music, digitized sounds and a whole lot more.

Many of the Ripper's features are only of interest to programmers and serious hackers (we mean that in the true sense of the word). For instance, the Ultimate Ripper does have the ability to disassemble code, edit system memory and many more very technical functions.

This review will not focus on those more technical uses of this cartridge. Instead, we'll try to give you a feel for how this cartridge works and look at some of the features useful to the average ST owner.

Let's Get Ripping

The package from Power Computing consists of a hard plastic case for storing your Ultimate Ripper cartridge and manual. The case indicates that a French and English version of the cartridge is available. There is no software disk—the Ripper software is built into the cartridge itself.

The cartridge isn't very remarkable to look at. Its only outstanding feature is a toggle switch located on the left side of the housing. With your computer turned off, you simply insert the cartridge into the cartridge slot. The Ripper is then ready for use.

Probably the easiest way to describe how to use the Ultimate Ripper is to use a real life example. Let's rip the title screen out of a game! The first thing you do is boot the game just like you normally would. When the title screen appears on your monitor, press the reset button on the back of your computer and hold it in. Then flip the toggle switch on the Ultimate Ripper and release the reset button.

Then, you have the option of pressing F1 or F2 to start using the Ultimate Ripper. Pressing F2 overwrites a specific part of system memory with the software in the Ripper cartridge. Pressing F1 moves that specific part of memory into another area of memory before loading the cartridge software.

It should be noted here that you have a few other options available. You could, for instance, press F7 to enter what the manual calls "trainer" mode. Or, you could press F9 to jump to the contents of address $30 (only of interest to programmers). Finally, you could press F10 to bypass the cartridge altogether.

After pressing F1 or F2, a few seconds passes and you are then presented with the Ripper's main menu. Pressing F1 at this menu takes you to the Image Ripper submenu. From here, you can scroll through your ST's memory, viewing the memory as graphic screens. Once you have found the graphic, you can save the graphic to floppy as a DEGAS picture.

While in the Image Ripper, you have control over a number of settings that affect the display of the graphic screens. You can change the number of planes, pixel width, resolution, color palette and more.

The Main Menu

The Ultimate Ripper can do a whole lot more than just search for graphics. From the main menu, you can select the Image Ripper, Memory Ripper, Disk Utility (rename files, erase files, format disks, etc.), External Call (load and run TOS programs), External Loader (load any file or disk tracks into memory), Music Ripper, Disk Ripper, Info (version number, etc for the cartridge) and Exit.

Selecting any of these entries on the menu (via a function key press) takes you to a sub-menu. We've already discussed the Image Ripper to some degree.

The Music Ripper

One of the more fascinating things you can do with the Ultimate Ripper is save music from your favorite games. The process is really quite simple. The hardest thing you have to do is figure out the starting and ending memory locations for the search parameters.

Once you've entered valid start

and end points, the Music Ripper software searches that memory range for any recognizable music files. If none are found, a message to that effect is displayed. If a music file is found, you are shown the starting and ending points in memory for the music, as well as a percentage indication of the search's success. We've only seen total failure or a 100% success.

Using Wrath of the Demon from ReadySoft, we found the music score for all the background music variations in one place in memory. We saved the music to disk as an executable file. Later, after booting the ST without the Ultimate Ripper on, we double clicked the music file. The music began to play from the desktop, and we could skip from song to song! Amazing.

Infinite Lives

One of the claims in the advertisement for the Ultimate Ripper is that you can use the cartridge to "search for infinite lives" in games. This is, indeed, true, but it's not a simple process.

What you have to do is use the Ripper in what is called "trainer" mode. In this mode, you have to use a separate piece of hardware that connects pin 20 to pin 22 of the RS232 port on the back of your ST when you push a button. This extra hardware is not supplied with the Ultimate Ripper cartridge, so you are left to create it yourself. While this is a fairly simple thing for most hardware hackers, it's not something every user can do.

If you do create the hardware, though, you can then interrupt a running program at will, search and replace values in memory and then restart the stopped program. This allows you to not only set a game for infinite lives, but also modify any program in memory without writing to disk. This is a great feature for programmers.

Calculations

Earlier, we mentioned the hardest part of searching is figuring out what values to use for memory locations. That is especially true if you aren't a programmer and have no concept of hexadecimal values or decimal to hexidecimal conversions.

Luckily, the Ultimate Ripper has a built-in Calculator. Pressing Control-C from any menu presents a box labeled "Expressions." Here, you can type in simple equations or do decimal and hexidecimal base conversions. So, if you have 512K or 4megs of memory, you can use the calculator to determine what your high memory value is.

The Manual

The 43-page user manual for the Ultimate Ripper is, frankly, the worst thing about this package. While it is chocked full of very detailed and technical information, the manual does not present this information in a very easy to understand or well organized fashion.

There are many times you must jump from section to section of the manual to get all the information you need to use a function of the Ripper effectively.

For example, to find all you need to know about searching for infinite lives in software, you find the first mention of this on page 3. There it says "Push the F7 key, and once software is in the drive, you will be able to enter infinite lives in the software." OK, sounds pretty simple. But, if you try it, the software reboots from disk and that's it. Nothing about entering infinite lives.

On page 37 of the manual, you find the next reference to using F7. Here, you discover that setting a game for infinite lives is a bit more complicated. On this page, you read "once you've loaded this option with the F7 key at the start, you may stop a program by creating [a ring indicator] interruption (push the switch at the desired moment)." What switch?

Your first instinct is the toggle switch on the cartridge, but that's not it. Your next thought is the reset switch on the back of your ST, but that's not it either! At the bottom of page 37 you are told, somewhat cryptically, how to make the hardware you need to create this ring interruption for the RS232 port.

Finally, if you read a paragraph on page 39, it all comes together. There, it spells out that you must use an "RS232 plug and the ring indicator" to stop the program. Sigh.

The only other problem with the manual is that it reads like a very bad translation from a foreign language. That's because that is exactly what it is—an English translation from a French original. While you can understand what the manual is trying to tell you, it does take some effort. Once you read the manual a few times, it all comes together, but it can be quite frustrating at first.

As a balance to all of the negatives concerning the manual, it does contain some of the best information you can get on the ST's disk and file structures, sound and video, how video memory works on the ST and a pile of other fairly technical subjects. If you find this kind of stuff fascinating or you don't know much about these subjects, it is well worth taking the time to decipher the information presented here.

Conclusion

The Ultimate Ripper is a unique product that packs a lot of features into one little cartridge. Programmers and hackers will probably find this to be an indispensible tool, while "average" users can have an awful lot of fun ripping graphics and sound out of games. For magazine and newsletter editors needing graphics from Atari games, the Ultimate Ripper is a wonderful piece of hardware. If you fit any of those above catagories, we wholeheartedly recommend this cartridge.

The Ultimate Ripper does have numerous capabilities that could very well lend itself to use as a "pirate's tool." However, it's probably not any easier to use for that purpose than any other disassemblers, file/sector editors, etc.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$39.95

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$14.50 ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$25.00

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY. $14.95

800 5 PIECE BOARD SET

Includes Main Board, Power Board CPU, 10K O.S. and 16K RAM Board. All boards new, tested and fully populated. Set includes instructions that will allow you to repair ANY 800 Computer $28.50

800/400 MODULES

New Parts Complete with IC's

• CX853 16K RAM Module	$9.50
• 800/400 CPU with GTIA	$8.75
• 800 10K "B" OS MODULE	$8.75
• 800 POWER BOARD	$14.50
• 400 POWER BOARD	$9.50

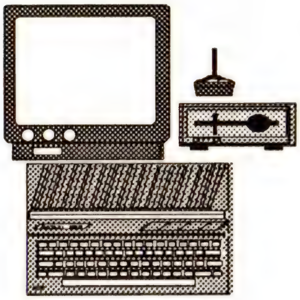
THE XEP-80 AND 9600 BAUD



John Tally (WNYAUG)

Well, to tell you the truth, I was not too sure just what to call this writing. It deals with the XEP-80, but at the same time it deals with BobTerm and the SpartaDOS X cartridge.

Well, let's just dive in and see what happens.

If you are one of the Atari 8-bit users who likes to modem, then you more than likely already know about BobTerm. If you don't, it is a real nice Atari terminal program written by Bob Puff.

The XEP-80 is a piece of hardware made by Atari that plugs into the number two joystick port of your Atari computer. Once hooked to a separate monitor, it allows you to have an 80-column display.

SpartaDOS X is a cartridge made by ICD. It is a full-blown and very powerful DOS (Disk Operating System).

Ok, now that we have an idea of what the three things are, let's get on to what I have found out. When Bob Puff updated his terminal program, BobTerm, to allow it to work with the XEP-80, I was very happy. After reading the documentation, I was not so happy. He said the XEP-80 cannot handle speeds past 2400bps.

Well, this did not sit well with me at all! I not only am an Atari user who modems but also one who happens to have a 9600 baud modem. I also null modem from my Atari to my IBM or from my Atari to my other Atari.

Speed can be of great help, and having 80 columns plus speed would be real super! I also call a lot of non-Atari boards running on STs, IBMs, etc. So again, having 80 columns plus 9600 baud would be great!

I decided to test this out. I followed the docs for BobTerm so that it would autoload in the XEP-80.BTM. I then null-modemed into my BBS, trying it at 19.2K, 9600, 4800 and 2400 baud. Well, needless to say, it only worked at 2400bps.

But I am not one to just quit; and, seeing as I also own the SpartaDOS X cartridge, I thought it might be fun to try BobTerm using the SpartaDOS X cartridge's XEP-80 handler.

I first fixed up BobTerm so that it would no longer load its XEP-80.BTM file. Well, I was again totally disappointed in the results...it did not work at all. Oh, sure, I could view text files from BobTerm and they would show up on the 80 column monitor, but it did not work when I would call into a BBS.

Okay. So now I was frustrated at the fact that here I had a 9600 baud terminal program, but I couldn't use it in 80 columns. I decided to try one more thing.

I once again set up BobTerm so that it would autoload the XEP-80.BTM file that comes with it. I then also set up my CONFIG.SYS file for my SpartaDOS X cart so that it would load the XEP80.SYS file that comes with it.

I then booted BobTerm and, so far, things were normal. I then logged onto my BBS (null modem) at 19,200 bps, and guess what? *It worked!*

I was on the board at the whopping speed of 19,200 baud, and I was viewing everything on the 80-column monitor! Well, I was impressed, and ready to jump out of my seat and tell the world. Not only was I on at 19,200 baud, I was getting *no* character loss...everything was real smooth (just like when I would use the IBM system). Boy, was I a happy man!

But, I knew this was not the final test. I still needed to know if this was going to work calling through the telephone lines to a remote system.

So I disconnected the null modem cable and proceeded to call out to a local BBS that supports 9600 baud. I logged on the remote system—*no problem.*

The 80-column text looked great! Again, I had no problems viewing the text.

So there you have it: The XEP80 can and does support high speed displays.

There are a few things I have *not* tested this out on. On my system, I use the MIO to interface the modem, so I have not tested this on the P:R: Connection or the 850. But don't worry, as I do have access to an 850 and a P:R: Connection, so I will be trying this out on both of them as well.

Well, I guess that's it. If you have any questions please feel free to send them to me care of:

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

Power Products for your 1050 drive

$69.95 THE SUPER ARCHIVER $69.95

The Super Archiver is more than just another double density high speed upgrade for your 1050 drive. Rather it is the most powerful **copying and disk editing** 8-bit tool available! Copies are **exact duplicates** of the originals: no patches or PDB files needed. Installation consists of a plug-in module and six simple solder connections. Software included. Only $69.95 + $5 S/H/I. Features include:

- TRUE DOUBLE DENSITY
- ULTRA SPEED read/write
- FULLY AUTOMATIC COPYING
- EXTRA MEMORY SUPPORT
- SCREEN DUMP to printer
- HEX/DECIMAL DISPLAY
- SECTOR or TRACK TRACING
- DISPLAYS HIDDEN PROTECTION
- AUTOMATIC/PROGRAMMABLE
- PHANTOM SECTOR MAKER
- ARCHIVER/HAPPY ARCHIVER COMPATIBLE
- BUILT-IN EDITOR reads/writes/formats up to 35 sectors/track
- CUSTOM FORMAT tracks up to 40 sectors
- BUILT-IN DISASSEMBLER
- TRACK MAPPER displays up to 42 sectors
- ADJUSTABLE/CUSTOM SKEWING
- AUTOMATIC SPEED COMPENSATION

$99.95 THE SUPER ARCHIVER II $99.95

The **SUPER ARCHIVER II** edits and copies all **ENHANCED DENSITY** programs plus retains all the features of our **SUPER ARCHIVER!** (see above.) This allows you to **COPY** or **CREATE** single or ENHANCED DENSITY protection schemes (including **PHANTOM SECTORS!**). Completely automatic and compatible with the **SUPER ARCHIVER I;** a truly **POWERFUL BACKUP/PROGRAMMING** device! Only $99.95 + $5 S/H/I. ***NOTICE!*** If you already own a **SUPER ARCHIVER**, you can upgrade to a ***SUPER ARCHIVER II*** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$79.95 THE BIT-WRITER $79.95

The Super Archiver **BIT-WRITER** is capable of duplicating the 'uncopyable' EA and SYN series which employ 34 FULL sectors/track. It performs its feat by re-assembling the track into bits, then writing it all back out. Simple installation: **PLUG-IN** circuit board and four solder connections. The **SUPER ARCHIVER** with the **BIT-WRITER** is the ultimate backup tool for the 1050 drive. **EXACT DUPLICATES** of originals are made. Must be used with the **SUPER ARCHIVER**. Only $79.95 plus $5 S/H/I.

>> FALL SPECIAL! << Order the ***SUPER ARCHIVER*** and ***BIT-WRITER*** combination for only **$149.95** plus $5 S/H/I!

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

***>> Fall special** price - **$59.95**! <<*

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

ADVENTURES IN STRUCTURED PROGRAMMING

MORE THAN YOU WANTED TO KNOW ABOUT RANDOM NUMBERS

(With thanks to our lately departed President, Ed Correia, for suggesting this topic.)

MICHAEL STOMP

Just what are random numbers? Some, attempting to be witty, will tell you that there is no such thing as a random number, but that misses the point. A random number could be defined as a number selected through a random process, which just passes the buck a bit. What constitutes randomness?

Since the word "random" has many unfortunate connotations of a more or less theological nature—free will versus determinism, chaos versus order, and so forth—mathematicians have coined a new word which, being unfamiliar, lacks such connotations. They prefer to talk about "stochastic processes." However, Mister Webster has doublecrossed the mathematicians, for if you look up "stochastic" in the dictionary you will be told that it means 'random'.

So, let's stick with the word random. A random process is one in which the outcome is governed by a probability distribution. Since we can use numbers to label the different possible outcomes, those labels are then random numbers. There—general enough to be useful to mathematicians and obscure to everybody else.

But now we have introduced another word: probability—which also has unfavorable connections to gambling. This is understandable, since the first scientific study of probability was performed by the Marquis De Laplace in the design of the games in the casinos at Monte Carlo.

But probability is not just about gambling or even about an absence of cause and effect in nature. Probability is about information. Some questions we ask, about systems for which we have complete information, can be answered by a simple "yes" or "no," or "true" or "false." But, for many other questions, the best we can do is a "maybe."

This is not because of the nature of the system itself, but because we lack the necessary information to do better. Probability, then, is a way of quantifying those "maybes" to get the best use out of the limited information we have.

A probability distribution is just a set of numbers, ranging between 0 and 1—0 meaning no or false or impossible; 1 meaning yes or true or metaphysical certainty; and anything in between meaning a stronger or weaker maybe—a set of numbers assigned to each possible outcome which reflects our state of knowledge about the system.

The word "system" may be a little vague here. Let me flesh it out with some examples. It could be an event that hasn't happened yet, in which we want to predict the outcome—such as "Will the 49ers win the Superbowl next January?" It could be something that has happened or exists now that we haven't measured yet, such as the current population of the county. Or it could be something that we have measured, but our measuring device is not 100% exact and we want to take that into account, such as measuring the dimensions of a table. Or it could be something that is impossible (or much too expensive) to measure completely and we take samples to get some information about the whole system. Product quality control is one example of that which comes to mind.

Let's explore one example. If I toss a coin into the air, we can ask several questions about the outcome.

1) Will it hit the floor?

I think we can give that a definite yes.

2) Where will it land?

We can't do as well on that one. It depends on where I aim and how good a shot I am. We would need to do some experimenting to get a measure of my accuracy.

3) Which face of the coin will be up?

Now, we have the least information about that, and no matter how much experimenting we do, the answer will probably remain a toss-up.

This leads us to the simplest type of probability distribution, the one in which we know little more than the number of possible outcomes. In that case, the best reflection of our state of information is to assign equal probabilities to each outcome.

Since the sum of the probabilities for all possible outcomes must total 1—it is certain that some side is up—we would then set the probabilities as .5 for heads and .5 for tails. To say otherwise would be to imply that we know something more about the coin—that it had been rigged, for example.

This probability distribution, where all outcomes are equally probable, is called a Uniform Distribution, and we would say that the coin flip is 'random and uniform over the set [heads, tails]'.

If we label the coin faces with numbers, [0, 1] say, we could use this coin to generate uniform random numbers from the set [0, 1]. (A footnote here—some restrict the term "random numbers" to ones selected from a uniform distribution only, whereas I, along with several authors, have used a more general definition.)

In a similiar way, the rolls of a die are described by a uniform distribution over the numbers from 1 to 6, the numbers in Lotto are uniform over the set from 1 to 49, and so forth.

The totals on two dice, however, are not uniform, even though each die separately is uniform. This is due to the fact that some totals can be made in more than one way. (This is additional information that we have in this case, and we must factor it into the probabilities. I won't digress further into the Probability Calculus now.)

In the examples so far, the number of possible outcomes have been finite and distinct, and could be represented by integers. That need not be the case. They may be infinite and continuous, and would have to be represented by continuous real numbers.

In my question #2 before—where would the coin land?—the position would have to be represented by real numbers, which would be infinitely close together. In such a case, we could not assign a probability to each number, but instead a probability density. And instead of summing over possible outcomes, we would have to dig out our Calculus books and brush up on integrals.

FREE Installation video w purchase of ram board w chips!

Howdy Partner!

ST/IME

Lithium 10 year battery backed-up clock and calendar module that fits in all the ST's. Install it under all the St's. Install it under one TOS ROM chip and all your files will be date and time stamped correctly. Comes with digital corner clock display. Frees up your cartridge port. Stop wasting time setting time! 3yr.warranty **NOW STe COMPATIBLE!**

~~$59.95~~ $49.95

Z-SIMMS STe SIMMs

NOW expand your new STe with Z-SIMMS, the STe 1 Megabyte SIMM module that expands an STe to 2 or 4 Megabytes. 1yr. warranty. Highest quality and with STe installation instructions.

~~$79.95~~ $54.95

Z-KEYS

✓ IBM-PC/XT keyboard interface to the 520STFM/1040ST
✓ Solderless internal interface that is easy to intstall.
✓ Complete manual and disk included.
✓ WORKS WITH PC/XT KEYBOARDS.

$79.95

With Keyboard: $129.90

Z-RAM/2.5 MEG

Ultra low-profile solderless 520ST/520STfm/1040ST 2.5 Meg memory upgrade. Fits under all RF-Shields, including the older 520ST's with external disk-drives. Plug & Play! Comes with 1 yr. warranty, detailed manual, RAMdisk software and diagnostics on disk.

$99.95	~~$129.95~~	w/o RAM
$229.95	~~$279.95~~	with RAM chips

Z RAM/Mega 2-to-4

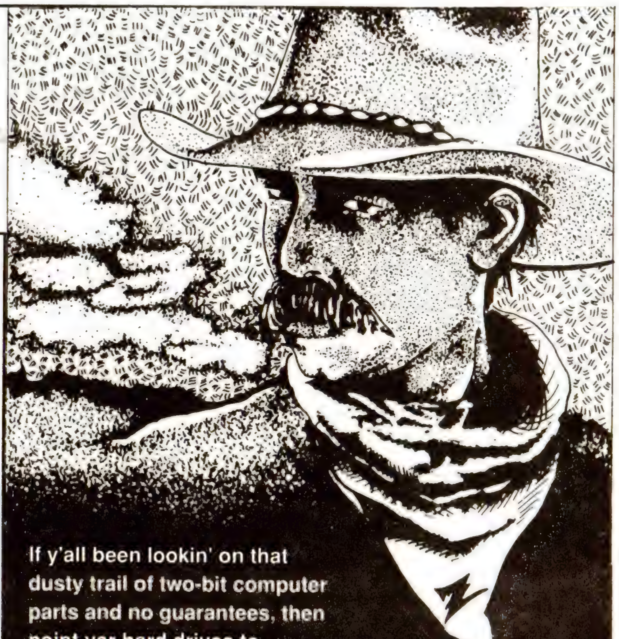
Solderless Mega2 Ram upgrade to 4 Meg. Plugs into the Mega2 and will not interfere with internal hard-drives. The easiest way to upgrade your Mega2 without soldering! Comes with complete instructions and diagnostics disk.

$99.95	~~$129.95~~	w/o RAM
$229.95	~~$279.95~~	with RAM chips

Z-RAM 3-D/4 MEG

Innovative 3-D double decker boards fit into the video shifter metal box of the ST. Memory diagnostics and RAM disk software included. 1yr. warranty and 30-day money-back guarantee. Super reliable data and ground connections make this *the* upgrade board for your ST.

0K (no chips)	~~$149.00~~	$109.95
2.5 Meg	~~$299.95~~	$249.95
4 MEG	~~$479.95~~	$379.95



If y'all been lookin' on that dusty trail of two-bit computer parts and no guarantees, then point yer hard drives to ZUBAIR INTERFACES! Nicest folk in the buisness and ready to supply your memory upgrades faster than a willow tailed coyote runnin' from some hot July sunshine! Call everyone. Then call us last for the best price!

We don't want to go into that here, and I only mention it now because the matter of continuous numbers will come up later. The probability density for the impact point of the coin would be the familiar bell-shaped curve, also called a Normal or Gaussian probability density. Most types of errors are well described by that distribution.

Now, to discuss the second of Ed's questions, "What would I use random numbers for in my computer?" There are two main uses—simulation and strategy.

In simulation, you want to make your computer behave like something else, and some features of that something else may be random processes. In games this can often be obvious—in card games, for instance, you want to simulate drawing cards from a shuffled deck. Other games involve rolling dice or flipping coins.

In those cases, the random processes are usually obvious. In other cases you want to mimic the vicissitudes of nature—earthquakes shake your nuclear reactor, rain turns your battlefield into mud, wind gusts toss your flight simulator.

A game is less interesting if such things happen too predictably, and could be unrealistic unless their variability matched that of real world events (i.e., had the same probability distribution).

Diamond Back II

Simply the **FASTest**, easily the most **FLEXIBLE**, and absolutely positively without question the most **RELIABLE** hard disk backup and restore program for the Atari ST!

▼ EASY to use 100% GEM user Interface ▼ Online Help
▼ Point and click to select specific backup paths and files
▼ Backup/Restore ANY number of specific files or paths
▼ Creates 100% normal TOS files! ▼ Full/Partial Restores

▼ Flexible include/exclude wildcards for backup/restore!
▼ Incremental backups ▼ Load/Save Configuration files
▼ Compression & Encryption ▼ CRC Validation Logs

Extra Special Features:
▼ Backup/Restore **Spectre** partitions! ACK & 3.0 OOP
▼ Intelligent Image option only backs up sectors w/ data!!
▼ Incredibly fast hard disk to hard disk backups!!!!!
▼ Full support for TT and 1.44M High Density Floppies

Same low price: $44.95
Upgrades to Diamond Back II V2.26 are only $5 from any version 2.20+ or only $10 from any version 2.11 or before(w/new manual).
Send your original disk and upgrade fee to:

I have seen one game, called UpTown, which involved dealing in the stock market. It was very unsatisfactory due to the fact that the swings in stock prices were completely unrealistic. A case of using the wrong distribution for random number selection!

I would briefly describe strategy as selecting one of a list of possible actions so as to obtain the best result. This can arise in competitive situations such as games or in simply dealing with changing circumstances. Often the best course of action is to vary the choice made in such a way as to avoid establishing a pattern. Choosing them randomly is the best way to do this. This is too big a subject to discuss further now. Better to save it for a bull session at a later time.

I should mention another use, not so easily classified. At a Club meeting a few months back in a demonstration on producing fractal images through transformations, I mentioned that the algorithm required that the transformation be chosen randomly. Many graphical effects require some use of random numbers.

The obvious question at this point is "How do I get random numbers?" Truly random numbers are very hard to produce, requiring much time and effort. One way to get some is to pick up a copy of a book, published by the Rand Corporation, entitled "One Million Random Numbers."

What we want, however, is some way to generate them in our computers. But if we use some determinate method, the numbers won't really be random, will they? They will be good enough for most purposes, but to be accurate we should call them "pseudo-random" numbers.

The most common method, called the Congruence Method, works this way: given three integers (a, b and T) and some integer, X(0) to start with—called the 'seed'—we form the sequence of numbers:

$$X(N+1) = a * X(N) + b \pmod{T}$$

where (mod T) means to divide a*X(N)+b by T and keep only the remainder.

This is all done in integer arithmetic, of course. The result will be a sequence of pseudo-random numbers, all less than T. After doing this T times, of course, the sequence will repeat itself, so one picks T to be much larger than the number of random numbers one expects to need.

It is obvious that these numbers are not truly random, since it is impossible to get the same number twice in a row, and with real random numbers there would be some slight chance of that happening.

Not all values of a, b, and T are good choices. however, and people have spent a lot of time finding values that do well on the tests for randomness.

For binary computers, T is usually picked to be a power of 2, so the division can be performed quickly by a simple right shift. And a is often one plus another power of 2, so the rest of the calculation requires only a left shift and two additions.

In this way, a random number generator is a natural for a hardware chip, where it will run very fast.

That is what Atari has done on the 8-bit's POKEY chip along with the sound generation. There, such a process is constantly in operation and an 8-bit random number is available in memory location 53770. One can access it (via Basic) by:

```
X = PEEK(53770)
```

and X will be a random integer between 0 and 255. If you need larger numbers, you can get them by:

```
X = 256 * PEEK(53770) + PEEK(53770)
```

This X will be random and uniform between 0 and 65535. Do the same thing one more time and you are now up over 16 million!

It is also handy to have continuous numbers in the range 0 <= X < 1, and you can get a pretty good approximation by:

```
X = (256 * PEEK(53770) + PEEK(53770))/65536
```

Not really continuous, but we can never get truly continuous numbers on a computer, can we?

Using Basic, this last step is really not necessary since it was included in the language, by:

```
X = RND(0)
```

This will be random and uniform over the (almost) continuous range 0 <= X < 1. This is very handy to have, for with it one can calculate random numbers over any range and for any probability distribution. Some examples:

```
X = INT(2 * RND(0))
```

This is the coin flip. Let 1 be heads and 0 be tails.

```
X = INT(6 * RND(0)) + 1
```

This is the simulation of a die. In general, to get integers, random and uniform over the range N1 to N2, inclusive:

```
X = INT((N2 - N1 + 1) * RND(0)) + N1
```

This works for negative numbers too, and is the method used in our raffle program.

And finally, one example of getting random numbers from a non-uniform distribution using RND(0). Let us say we want to choose X so that:

```
X = 1 with probability P1
    2  "        "        P2
    3  "        "        P3
```

where P1+P2+P3 = 1. (Only 3 choices possible.) Then, using the syntax of TURBO BASIC XL:

```
Y = RND(0)
IF Y < P1
   X = 1
ELSE
   IF Y < P1+P2
        X = 2
   ELSE
        X = 3
   ENDIF
ENDIF
```

X, as chosen, will be random with the desired probabilities.

Imagine being able to load any Atari desk accessory "on the fly" whenever you like, even while running programs ... or imagine desk accessories that free themselves from memory when you're done with them, so you have more memory to run your applications ... and you've just imagined **MultiDesk Deluxe** from CodeHead Software!

MultiDesk was the first ST program to break through the GEM limit of six desk accessories. Now, the new version has taken another quantum leap in functionality, giving you more free memory, more desk accessories, and faster bootups than ever before.

MultiDesk Deluxe now supports "nonresident" desk accessories which share the same memory space. These DAs are loaded into memory when you select them and wiped out of memory when you close them ... with zero compatibility problems!

When you open up the Mac box, by removing packing tape and then staples, the first thing you see is a "Welcome to Your Macintosh" type pamphlet that introduces the buyer to the computer.

The computer is packed in white Styrofoam, which matches the box, and all the literature is done in white as well. A white box labeled "cables" or something to that effect tells the user something important is in another smaller box.

What we have here is the impression that whoever designed the big box worked with the people who designed the packing, who worked with the people who designed the instructions. A proud computer. This gives the new owner a subliminal idea that this company has its act together, whether it does or not.

When you open up the Atari box, by removing a few staples, a yellowish foam-like substance that is covered in a blue plastic faces you. The computer is covered in blue plastic, the keyboard is covered in clear plastic.

Underneath the computer is the instruction booklet. No "Welcome to Atari," no "Thanks for buying this computer." Just instructions and a warranty. Another unlabeled cardboard box contained the cables and such.

I will grant that the foam is very good for shipping, and my computer was unblemished. However, the entire packaging looked like it was done by committee. Box, foam, plastic and instructions looked like completely different people did them. A proud computer company? The packaging didn't imply this at all. A confused computer company? Well, you be the judge.

Inside the Mac box was a Thank You note for buying the computer. And, along with the Thank You note, there was a postcard that the buyer could send in for one of three gifts: A mouse pad with the Apple logo on it, a T-shirt with the Apple Logo on it or a free subscription to a Macintosh specific magazine.

Granted, these aren't gifts that would put Apple out of business, but they *are* gifts nonetheless. A free T-shirt is a free T-shirt. A very nice symbol on the part of a company that lets the buyer know "Hey, we realize that you just dumped a ton of money on this thing; here is a token of our appreciation."

Inside the Atari box, nothing of the sort. How much skin off the noses of the big brass would it be if they would offer a free subscription to Atari Explorer or a free mouse pad? Not a whole lot I think, and I also believe the all important "bottom line" wouldn't suffer too much. A few thousand free subscriptions to Explorer couldn't hurt advertising in that mag too much. A few thousand T-shirts that say "Atarians are Mega Lovers" or something like that would be pretty good free advertising.

You think Apple minds if a few thousand people are walking around downtown L.A. or New York with Apple T-shirts? Or some college student wears a free Apple T-shirt to his marketing class? Heck no! Free advertising for the cost of a few T-shirts is not a bad deal. And the owner of the new computer feels good that this big, old computer giant gave him something for free! That, my friend, is marketing at its best.

So, draw your own conclusions about boxes. I am reminded of a dandruff commercial which says something about making a first impression. Once the first impression is made, it is made—you can't take it back. Something so simple as a box and instructions should not make a bad impression. My Mega/STE box did.

I don't care if Atari is not as rich as Apple. I was the one that spent the money; I am the one that needs to be impressed. The customer comes first, every time. Period. Corporate box blunder? Well, sometimes it is just the smallest detail that separates a sale from a non sale.

Atari bashing? Hardly. I just spent $1700 bucks on their hardware. Think of this as just another suggestion, Sam. Take it for what it's worth.

Boxes

Tim Holt

Sometimes I wonder whether or not some companies actually have any idea what goes on in the real world, or whether they just listen to some off-the-wall Gallup poll to get the "pulse" of the situation.

Think of all the corporate blunders you have heard of over the years: New Coke. Does anybody drink that stuff?

Several years ago, Chevrolet introduced the Nova automobile in Mexico and could not understand why the heck it didn't sell. Turns out that "No va" in Spanish means "Does not go." Nice car, bad name.

When Pepsi introduced its slogan "Pepsi: The Choice of a New Generation" in China, it was translated into "Pepsi: It will Bring Back to Life Your Dead Relatives." Good drink; bad slogan.

The most recent example of this type of corporate blunder happened right here in El Paso. We have a grocery store by the name of Skaggs. When they decided to change their name to "Jewel Osco," no one asked what osco meant in Spanish, which is what most people in El Paso speak. Seems that osco, or the pronunciation of that, means "nauseated feeling." Great name for a supermarket, eh!

So, what the heck does all this have to do with computers? Well, I was thinking about corporate blunders when I was trying to decide what computer to buy. Seems my faithful workhorse 1040 ST decided it was time to go to computer heaven, and I needed a new one. What to get...what to get?

Well, to make a long story short, I ended up with a Mega STe/4, which I am quite happy with and which runs my Spectre GCR just fine thank you. So, this article will *not* be a "why I switched computers even though I love Atari" type of article. This article has to do with boxes.

My new Atari came in a box. No surprise there.

Since I work in a school, however, I get to see all the neat new stuff that comes down the pike for education, and all the boxes it comes in. My school recently was sent two new Macintosh LC computers, so I got a chance to compare my Atari box to the Mac boxes.

Now I know this seems really trivial, but first impressions mean a lot to some people. The first impression that most people get from their computer is the box that it comes in.

Here is the tale of two boxes....

Apple sends all of its computers in thick, and I mean thick, cardboard boxes that a student of mine that weighs 100 pounds could easily stand on without crushing it. (I tested this theory and it worked.)

Outside, the color Apple logo and a reproduced picture of the computer adorn all sides of the box. Also, there is a plastic packet that invites the new owner to update to System 7. Clean, crisp, bright. This box said "You are the owner of a proud computer."

Atari sent my new computer in a medium weight cardboard box that was stamped "Taiwan" on the side, "Port of Los Angeles" on the other side, was crushed on one side and had a tear about eight inches long. It looked like Edward Scissorhands was the longshoreman who unloaded the computer off the boat.

The box's color was the color of a paper sack. The picture of the Mega/STe4 (the finest home computer on the market today, as all of those at Atari will tell you) looked like a line drawing done for a clip art publication. It wasn't even a picture of the computer. This box did nothing to inspire confidence on the part of the owner. Is this a proud computer from a proud company? One could not tell from the box.

When you open up the Mac box, by removing packing tape and then staples, the first thing you see is a "Welcome to Your Macintosh" type pamphlet that introduces the buyer to the computer.

The computer is packed in white Styrofoam, which matches the box, and all the literature is done in white as well. A white box labeled "cables" or something to that effect tells the user something important is in another smaller box.

What we have here is the impression that whoever designed the big box worked with the people who designed the packing, who worked with the people who designed the instructions. A proud computer. This gives the new owner a subliminal idea that this company has its act together, whether it does or not.

When you open up the Atari box, by removing a few staples, a yellowish foam-like substance that is covered in a blue plastic faces you. The computer is covered in blue plastic, the keyboard is covered in clear plastic.

NeoDesk 3.0 (c) Gribnif Software. UIS III (c) A&D Software.

Underneath the computer is the instruction booklet. No "Welcome to Atari," no "Thanks for buying this computer." Just instructions and a warranty. Another unlabeled cardboard box contained the cables and such.

I will grant that the foam is very good for shipping, and my computer was unblemished. However, the entire packaging looked like it was done by committee. Box, foam, plastic and instructions looked like completely different people did them. A proud computer company? The packaging didn't imply this at all. A confused computer company? Well, you be the judge.

Inside the Mac box was a Thank You note for buying the computer. And, along with the Thank You note, there was a postcard that the buyer could send in for one of three gifts: A mouse pad with the Apple logo on it, a T-shirt with the Apple Logo on it or a free subscription to a Macintosh specific magazine.

Granted, these aren't gifts that would put Apple out of business, but they *are* gifts nonetheless. A free T-shirt is a free T-shirt. A very nice symbol on the part of a company that lets the buyer know "Hey, we realize that you just dumped a ton of money on this thing; here is a token of our appreciation."

Inside the Atari box, nothing of the sort. How much skin off the noses of the big brass would it be if they would offer a free subscription to Atari Explorer or a free mouse pad? Not a whole lot I think, and I also believe the all important "bottom line" wouldn't suffer too much. A few thousand free subscriptions to Explorer couldn't hurt advertising in that mag too much. A few thousand T-shirts that say "Atarians are Mega Lovers" or something like that would be pretty good free advertising.

You think Apple minds if a few thousand people are walking around downtown L.A. or New York with Apple T-shirts? Or some college student wears a free Apple T-shirt to his marketing class? Heck no! Free advertising for the cost of a few T-shirts is not a bad deal. And the owner of the new computer feels good that this big, old computer giant gave him something for free! That, my friend, is marketing at its best.

So, draw your own conclusions about boxes. I am reminded of a dandruff commercial which says something about making a first impression. Once the first impression is made, it is made—you can't take it back. Something so simple as a box and instructions should not make a bad impression. My Mega/STE box did.

I don't care if Atari is not as rich as Apple. I was the one that spent the money; I am the one that needs to be impressed. The customer comes first, every time. Period. Corporate box blunder? Well, sometimes it is just the smallest detail that separates a sale from a non sale.

Atari bashing? Hardly. I just spent $1700 bucks on their hardware. Think of this as just another suggestion, Sam. Take it for what it's worth.

GRAPHIC IMPACT!

Finally a Fast, Flexible and Easy to Use Graphing Program for the Atari ST/TT!

Now you can create presentation quality graphs in minutes! No need to use clumsy spreadsheets with limited graphic flexibility. Don't waste hours of your time with drawing and painting packages! **FIRSTGRAPH** gives you the power to create stunning charts and graphs that will enhance your business reports, science projects, newsletters.... Improve your lab reports, homework, presentations.... Chart your expenses, track your inventory.... Impress your boss, your clients, your professor or your students! **FIRSTGRAPH** makes it possible - effortlessly!

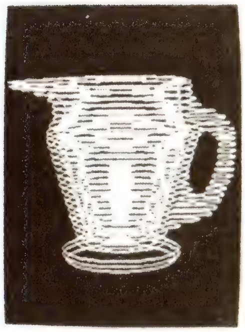
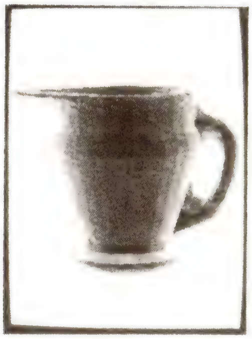
3-D MODELER FOR 8-BIT ATARI!

All of the pictures appearing on this page (except the top right) are unretouched TV-screen photos of 3-D models rendered by a new commercial 3-D shaded-modeler for Atari 8-bit computers.

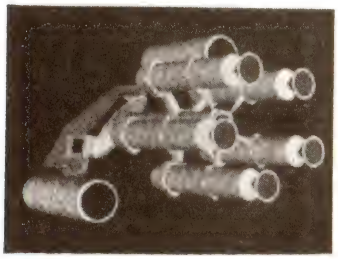
Two new programs!



Pitcher, rendered by MODEL BUILDER (TV Screen Photo)



Same Pitcher ,rendered by SURFACE SHADER (TV Screen Photo)



Space ship, 5 cluster rockets (TV Screen Photo)

Close up of cluster rockets from the top (TV Screen Photo)

ChromaCAD™ 3-D MODEL BUILDER 91 program

With the ChromaCAD™ MODEL BUILDER program, you can build any 3-D model you can dream of. You merely start at the bottom and draw the contour lines of the model as you work your way up. Add surface colors to the model as you draw the lines. *You* decide how many contour lines to use for each model (up to 158) and *you* decide the elevation of each line. Huge scrolling 32767 x 32767 graph allows you to construct contour lines *as detailed as you want.* Supports computer-assisted drawing of lines, circles, arcs, ellipses. Displays models in contour-line form.

With This program, you will be able to construct unbelievably sophisticated 3-D models. The MODEL BUILDER 91 program reflects a new breed of 3-D modelers -- completely free-form, sculptured-surface -- no "extrude" or "sweep" limitations. You will be able to construct models of human heads so accurately that, when you display them with the ChromaCAD™ SURFACE SHADER XE 91 program (described below), *you will be able to recognize the subject from the model !* (See the photo of an actual bust and the 3-D renderings.)

ChromaCAD™ SURFACE SHADER XE 91 program

The ChromaCAD™ SURFACE SHADER XE 91 program can display any model constructed by the MODEL BUILDER program in surface-shaded format from any point of view, using up to three lights. Lights can be individually varied in intensity and individually set to strike the model from any direction. Models can be displayed in a variety of modes, including high resolution, color,and *3-D stereo.* Colors can be reassigned instantly without replotting the model. Up to 61K of computer RAM can be used for image display memory. (The screen photos appearing on this page are of models rendered in high-resolution 61K format.)

Up to ten models can be individually oriented in 3-D space and displayed together to produce one compound multi-model scene. (Terrain model, Airport model, airplanes, cars etc. combined to produce one scene.) The program also supports negative, mirror, and stepped-tone rendering, automatic clipping, highlighting, ambient lighting, and inside viewing of models. We know that all of this is hard to believe so, with purchase of the SURFACE SHADER XE, *we include the bust model (shown to the right) free of charge.* You, yourself, can view the model from any angle, in any mode, using any lighting or rendering option you want.

View any model in 3-D Stereo! (With included 3D stereo glasses.) Watch models virtually jump off the screen.

ChromaCAD™ MODEL BUILDER 91 program with
136 page illustrated, indexed manual
Order # 21 (requires 48K Atari) $29.95

ChromaCAD™ SURFACE SHADER XE 91 program with
69 page manual, 2 pair Stereo 3-D Glasses
and sample MODEL DISK #1 (contains 10 models)
Order # 35 (Requires 130XE) $29.95

TEXTPRO+ TUTORIAL FOR THE 8-BIT

Ellen Lentz (ACCT)

TextPro+ version 4.5 is a professional word processor for the Atari 8-bit computer, requiring 48K memory.

It is a Shareware program distributed by Ronnie Riche and is available on many BBSes, including CompuServe and GEnie, or from a registered user. Mr. Richie will send you a distribution disk for $15 or enroll you as a registered user for $40. Instructions for becoming a registered user are in the documentation.

TextPro+ is very easy to use. It is a binary load file (TP45.OBJ) and is loaded with the "L" option from DOS or at bootup by renaming it AUTORUN.SYS.

After the title screen, you will be placed in the text editor, where you can start typing in text or load a previous file. If no file is loaded, the file name "NAME.ME" will appear. Additional files can be loaded at the position of the cursor, but they do not merge—they will wipe out the following text.

TextPro+ gives you the ability to scroll by character, word, sentence or paragraph, as well as to the beginning or end of a line, or to the beginning or end of your text, as indicated on the Quick-Reference Sheet.

You can delete by character, word, sentence, paragraph or string. The deleted text can be stored in the buffer or added to the buffer. The size of the buffer can be manipulated (see Section 1.3.1 of the manual). The default is "8" for a 2K buffer. The larger the buffer, the less room you have for text entry. Using Atari DOS 2.5, there is 18.5K available for text. Text Editing commands are listed in Section 2 of the manual.

All of the Print Formatting Commands are sent before the first line of text except for Centering, Right Justify and Z-Margin, which are designed to work on one line of text. They are inserted via lower case letters entered with the SELECT key. There must be a space between the command and the beginning of the text.

If you change the globat format commands during editing and wish to restore them to the original defaults, press CTRL-J. Print Formatting Commands are in Section 7 of the manual.

TextPro+ loads in REPLACE mode, but you can toggle between INSERT and REPLACE mode with CTRL-I. Since Insert mode requires movement of all the text down, it is sometimes quicker to work in Replace mode, especially if you're at the beginning of a long file.

To allow insertion of characters, SHIFT-INSERT inserts 255 spaces at the position of the cursor, and SHIFT-DELETE deletes the unused spaces. If you don't need that many spaces you can use CTRL-TAB to insert the number of spaces that you define by using SHIFT-TAB. (Default is 5 characters.)

Documentation for TextPro+ is quite extensive. It is formatted for the TextPro+ program and can be printed by loading each section (TPDOC.A01 to TPDOC .A12) into the editor with a CTRL-L and printing it with CTRL-P. Loading a file with the cursor at the home position will erase the existing file.

TextPro+ supports many different DOSes and is unique in that it will allow you to exit to DOS.

The Table of Contents for the documentation is in TPDOC.TOC. There are also three READ.ME files which can be printed.

The Quick-Reference sheet accompanying this article contains most of the basic commands, but for a better understanding as to how to use them and for those not listed, you should read the documentation. The complete list of keyboard commands is in Section 12 of the manual.

There is no global format as such, but any .CNF (Configuration File) contains the global formatting commands.

A file titled TEXTPRO.CNF will automatically load at start-up time if it is present on your disk. You can then load additional .CNF files by pressing SELECT-CTRL-L in the text mode. Thus, you can have different global formats for different uses, such as letters, labels, documentation, etc. The preset values are:

<l> - Left Margin = 5
<y> - Z margin = 5
<r> - Right Margin = 75
<p> - Page Length = 66
<t> - Top Margin = 5
<b> - Bottom Margin = 58
<s> - Line Spacing = 1
<x> - Line Width = 80

To create a TEXTPRO.CNF file, hold down the SELECT key during program start-up. A prompt "Dec.# <l>" will appear, where <l> will be the inverse letter l for Left Margin. If you wish to change it, type in the new left margin (such as 10) and hit return. If you don't wish to change it, just hit return. The cursor will then move right and the next letter will appear. Continue typing in your decimal values until you have entered them all. Caution: Bottom Margin should be the line at which the margin starts. There should be room in the top and bottom margins for any headers or footers.

You will then go to the editor, where you can save the file. Press SELECT-CTRL-S and type in TEXTPRO.CNF on the command line. This global format will be saved and will then load at startup time. You can create other .CNF files for different purposes by going through the same procedure and giving them a different filename such as LABELS.CNF or DOC.CNF. Load them as needed by pressing SELECT-CTRL-L.

Since the global formatting commands are not in your text, you can use TextPro+ to create an ASCII file (no inverse characters) which will import directly into such programs as Daisy Dot III.

To customize your .CNF files for your particular printer, you use the SELECT key with an upper-case letter followed by an "=" sign and the decimal value. You do this in the text mode.

For example, if the decimal values for underlining on your printer are Start Printing = 27,45,49 and Stop Printing = 27,45,48, you can set up <U>=45 <X>=49 <Y>=48. (The 27 is the value for the Escape key which you can generate by hitting the Escape key twice, so you don't have to set it up.) Follow this by pressing CTRL-W.

The <U>, <X>, and <Y> keys are now defined for your print session. If you wish to save it to a .CNF file, press SELECT-CTRL-S and give the name TEXTPRO .CNF (or whichever file you are customizing). To use it in your text, you would then type Esc (hit the Esc key twice) <U><X> to start underlining your text, and Esc<U><Y> to stop the underlining.

Similar keys can be set up for Bold printing, Italics, Double-Wide, Pica, Elite, Condensed, etc. Any command prior to the CTRL-W will be saved. Since you will only be setting these up once for each printer, you can do them before typing your text. After saving them to a .CNF file, you can clear text with a SELECT-CTRL-U (Delete to top of file) or SELECT-CTRL-V (Delete to bottom of file), and you will be all set to type in your text. Sections 1, 8 and 9 of the manual give detailed instructions for full configuration of TextPro+.

The file TEXTPRO.FNT is any Graphics 0 font and will be used in the Editor. If present, it will load automatically at start-up. If you want the regular Atari font, rename this file ROMAN2.FNT. For any other font, rename this font and rename the other font to TEXTPRO.FNT.

CTRL-M brings up a Disk Menu which allows you to process your files, such as Load, Rename, Delete, Format, View, etc. It works on the highlighted file. If the arrow keys do not work to choose a file, try deleting the DOS.SYS and DUP.SYS on your TextPro+ disk and writing Atari DOS files to it. It will work properly with any DOS 2.0 or 2.5 compatible DOS. A return or escape key will return you to the text. Instructions for this are in Section 6. See Section 10 of the manual for additional features supported for SpartaDOS and MyDOS and an explanation of support for the full range of DOS packages.

You can create a directory listing in the editor by using CTRL-L (load). Enter a mask of "*.*,D" followed by a return, and the directory of Drive 1 will be loaded to the editor. You can specify which files you want listed in the mask (such as "*.DOC") and whichever drive number you want. Go to the end of the file and do the same for another disk. The new directory will append to the file. You can track your disks easily by typing a short description of the disk and operating instructions (i.e., "must use BASIC") at the top of each listing. You can then use the FIND feature to quickly locate files you want, using TextPro+ as a competent disk library program. Detailed instructions for this feature are in Section 5.4.1 of the manual.

For further information, contact Ron Riche, 1700 Aylock St., Arabi, LA 70032.

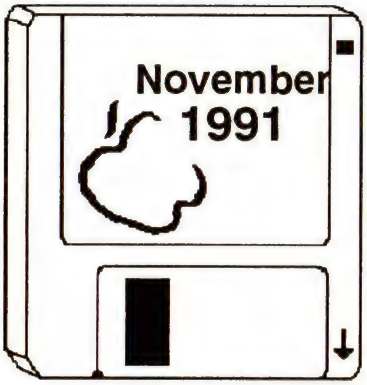
MasterCard



AIM Mac/Spectre Disk of the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting archives. Just double click to extract!

Here is a short description of the files contained on the November '91 Disk of the Month:

BatchPrinter—BatchPrinter 1.3 prints any user selected group of TEXT files all at once.

BiPlane 2.05—BiPlane is a Shareware spreadsheet that features SYLK file compatible with Microsoft Excel, 512 column by 16,384 rows, 102 functions, and business graphics support.

DAPiggyBack—DA Piggyback v1.3 lets you launch DAs as applications. DAPig cuts down on Apple menu overcrowding and lets you set memory requirements for each DA. Works with System 6.0.4 through 7.0. Shareware.

DiskDup+—Version 1.54 of DiskDup+, a fast, efficient disk duplicator with full checking. It copies in one pass with 2 megs or more and never mounts the disks, preventing virus contamination of master or copy. Counts copies and uses both disk drives, if available. Shareware.

EasyKeys—Easy KEYS v1.2 lets you run FKEYs or launch DAs and applications with any key combination. Now you don't need ResEdit to load FKEYs and you can organize your FKEYs in separate files. Also includes an FKEY called Flipper, which lets you flip layers when an application puts you in a modal dialog box. Shareware.

GNU Chess 3—Excellent chess game from the Free Software Foundation with a real Mac interface. Play against another person or the computer, or let the computer play itself! Includes C source code.

Labyrinth—Maze game in which you roll a marble through the maze and try to avoid the holes.

Register—A full-feature check book/ account manager as a Desk Accessory. Only 23K with resources. Written in Assembly. Supports ASCII printers, prints checks and reports. Shareware.

Rhine—Test your ESP. This works just like the cards used by professoinal parapsychologists. Supports color for color Macs (also B&W) and is FREE.

SerialPrint II—A DA that prints TEXT files on printers connected to a serial port. Uses built-in printer fonts, for faster printing than with standard drivers. Supports Apple ImageWriter I and II, Epson FX and LQ, IBM Proprinter and HP DeskJet printers.

SpoydWorks Solitaire—SpoydWorks Solitaire 1.2.1 is Steve Boyd's Shareware collection of six solitaire variations: Easthaven, Klondike, Spiderette, Westcliff, Will o' the Wisp and Yukon. Distributed by GAMER Project.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor,MI 48108. Please specify the November '91 Mac/ Spectre Disk when ordering.

We also have a special November Games Disk available. This disk contains recent PD and Shareware releases for the Mac. Here's a short description of these games.

Ashes+—Ashes+ is a clone of the arcade hit Missile Command, complete with rockets, lasers and particle beams.

Brickles Plus 2.0—BricklesPlus 2.0 is Ken Winograd's Shareware version of Breakout. You select 1, 2 or 4 paddles/ sides, ball size, paddle size, etc. Distributed by GAMER Project.

Glypha—Glypha 2.0 is a clone of the popular Joust arcade game, with an Egyptian twist. Joust against Sphinxes on your "winged steed," pick up the eggs and avoid the mummy's grasp, the lava pit and the Evil Eye! Shareware, written by John Calhoun and distibuted by GAMER Project.

MacTris 1.1—Standard Tetris clone from TVark Productions. Align the falling pieces to fill horizontal rows. The more rows you clear, the more points you get. Shareware.

RiverBoat Poker—RiverBoat(tm) Poker has features for the novice and professional. It may be used for entertainment, as practice for real poker play, or as a tool for studying poker dynamics.

Trek 1.2—Nice version of the classic Star Trek game. As the built-in help says, "See Klingon. Kill Klingon. Watch Klingon die." Shareware.

Wolves—Wolves in the Woods is a teaser for Bill Appleton's soon to be released arcade game, Frankie's Dungeon. Excellent action and sound. Square off against classic movie monsters.

Readers can purchase this disk for $6 ($5+$1 s/h). Please specify the November '91 Mac/Spectre Games Disk when ordering.

AIM ST Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the November '91 disk. For more complete docs, see the text files contained in most of these archives.

ARCSHL26.APP—ARCShell version 2.6, with full support for the newest LZH archivers that now handle arcing of subdirectories. Shareware from Charles F. Johnson and Little Green Footballs Software.

AUTOZEST.APP—Auto ZeST creates NeXT look-a-like front ends for your own GFA programs! Simply 'draw' your own custom graphic user interface in this CAD type program and Auto ZeST will save GFA code to disk. Create 3D push buttons, sliders, lines, carved text, info boxes, windows, platforms and more! Mono ONLY. Freeware.

AVDEMO.APP—Demo of Avant Vector imported by CodeHead Software. Avant Vector is an autotracing and vector graphics application. This demo works best in ST high (monochrome), TT medium or TT high resolutions.

BOING.APP—Use the bouncing ball to collect the fruit in this color, low resolution game. Difficult to master and hard to stop playing.

CHANGEHZ.APP—If you've ever encountered an import program that wants to run at 50Hz instead of the US standard of 60Hz, here's a little program to solve your problems. CHANGEHZ.PRG toggles your display between 50Hz and 60Hz.

CHKMIDI.APP—Test your MIDI cables quickly and easily! Just plug one end into the MIDI out port, the other into the MIDI in port, and click on Test. You'll know instantly if the cable is good or bad!

CLOCK.APP—A nice little analog clock desk accessory with C source code. Written by John Jainshigg of Atari Explorer.

DCREZRUN.APP—A neat little program from those Double Click guys. DC Rez Run automatically switches resolution for programs that only run in a specific rez. No more "Please Switch to xxx Resolution" messages!

DEMOMAKR.APP—Demo Maker: Create your own demos and add pictures, sound and music. Easy to use language and instructions. Requires one meg and a color monitor.

GAMES.APP—Two games written by Erin Monaco. EUCRE is the popular Eucre card game. You and a computer teammate take on two computer players. A great game. 5OFAKIND is a Yatzee variation that is also excellent and very easy to play, with a one or two player option. Both games are COLOR only.

ICONEDIT.APP—Demo of the NewDesk Icon Editor CPX from Software Development Systems. You must have XCONTROL.ACC (Atari's new extensible control panel) to use this CPX file, and the Icon Editor is primarily of interest to Mega STE and TT owners.

INFODISK.APP—A complete newsletter-on-a-disk environment shell. Allows newsletter editors to quickly and easily create a professional disk-based newsletter. Features include multi-format picture file support, fast read and multi-option display of text files, built-in help, and a GEM interface with an editor-definable menu structure. Shareware.

MDESKDLX.APP—A demo version of CodeHead Software's new MultiDesk Deluxe. This demo is fully functional, but will only run for ten minutes. MultiDesk Deluxe allows you virtually unlimited use of Desk Accessories without using up piles of system memory!

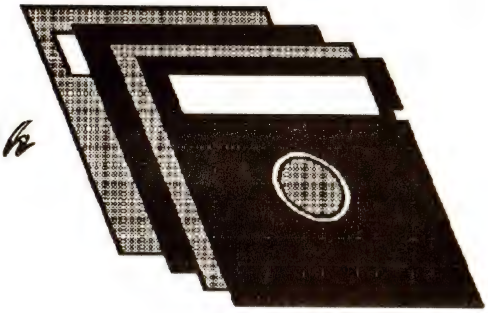
PRODUCEM.APP—Play a big time movie producer in this Michtron BBS game. MCL source code included, so you can add this online game to your own Michtron 3.0 BBS.

STUNARJ.APP—Here it is, an ATARI ST version of the new hot PC compression format: 'ARJ'. ARJ is the best of both worlds, compresses slightly more than LHA at PKZIP speed. This ST version is between 2 and 3 times faster than ARC 6.02 or LHARC 1.13 Extractor only.

WHATIS47.APP—Version 4.7 of Bill Aycock's popular WHATIS utility. Recognizes 86 different file types. Is that file you just downloaded an ARC, an LZH, a program or what? Don't keep guessing, use WHATIS.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the November '91 ST disk when ordering

AIM 8-Bit Disk of the Month November 1991



Each AIM 8-bit Disk of the Month is a single-sided, single-density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility (available from most BBSes, user groups or on the April/May '91 AIM 8-bit Disk).

The November '91 disk contains all the files necessary for the AtariLink BBS 2.0x. This is written in Atari BASIC and works best with SpartaDOS, but also works with Atari DOS 2 and others.

The BBS supports RAMdisks, MIO interfaces, hard drives and 2400 baud. External "Door" programs are also supported. Also supports lots of download protocols, including Ymodem Batch. All in all, this is a great BBS system.

Side 1

LINK20XP.ARC—The main archive containing Atari Link2.0x. This BBS was two years in the making and supports all Hayes compatible modems.

LNK20SDX.ARC—Startup file for running AtariLink with SpartaDOS X. Allows you to automatically go to BASIC and run the BEGIN program.

GWALL12.ARC—External Door program to add a Graffiti Wall.

Side 2

L20XADRS.ARC—Autodoor programs for AtariLink, including automatic validator, Email cleanup, compactor, Thought for the Day and modem manipulation programs.

L20XDOC.ARC—Documentation for AtariLink 2.0x.

LINK20XW.ARC—Sample files for your AtariLink workdisk.

DOSPATCH.ARC—Patch to cure memory problems you may under DOS II with a high MEMLO. See section 6 of the LINK20X manual for details.

PTCHDATA. ARC—Use this patch if you need to add lots of your own commands. Readme file enclosed.

ESTEPTCH .ARC—This ARC includes patches and modifications from Atari Exchange of Louisville. Includes documentation and a "door" command allowing exit to DOS from within the BBS.

Readers can purchase this disk by sending $6 ($5 + $1S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor,MI 48108. Please specify the November '91 8-bit disk when ordering.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, from 6:30 to 9:30 PM. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Library of about 700 disk titles. Each month we publish (FR)ANTIC covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

AACE
ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

President	Richard M. Houser	(505) 299-3977

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public.

Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, SDACE newsletter subscription, and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President Michael Bergman (619)558-7866
BBS 24hrs, 300-2400 68MB (619)689-815

SEV AC

South East Valley Atari Connection meets the third Saturday of each month at 10 AM at 3234 S. Fair Ln. (Eaton Business Park, just off of 48th Street and Southern), Tempe, Arizona. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit libraries and monthly newsletter.

President Marc Dyer (602) 897-0314

SPACE

SPACE, the Southcentral Pennsylvania Atari Computer Enthusiasts meet on the third monday of the month at the Camp Hill Mall Community Room. The doors open at 7:00 and the meeting begins at 7:30. Dues are $15.00 per year and includes a subscription to AIM and SPACE Probes, our official newsletter.

For more information, call either John Slade, President at (717) 938-3656 or John Hileman, Newsletter Editor at (717) 938-8753 or write to: SPACE, PO Box 11446, Harrisburg, PA 17108.

SST

Sacramento ST User Group

The Sacramento ST users group supports the ST and TT family of computers and meets on the second Wednesday of every month at the Pac Bell auditorium at 2700 Watt Avenue. The meeting starts at 7p.m. with an informal beginners session with the regular meeting starting at about 7:25.

Dues are $24 a year and membership benefits include, the club's newsletter, full access to the club sponsored bbs, a free raffle ticket at every general meeting, membership disk, access to our extensive disk library for an extremely reasonable rate and a subscription to AIM.

President	Mark Warner	(916)344-8320
ST-KEEP BBS	(916)331-6153	(916)729-2968

STAG Saginaw / Tri-City Atari User Group

"where the deer and Atarians play"

The Saginaw/Tri-City Atari User Group meets the last Saturday before the 18th of the month, at 9 am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township, Michigan. Upcoming meetings are November 16th and December 14th 1991.

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's Public Domain library, disks are $3 for a double-sided disk packed full of goodies (2 for $5, what a bargain!). Check your mailing label, if you need to renew, (or haven't joined us yet!). A free PD disk is included with each new membership or renewal! DO IT NOW!

President	Bryant LaFreniere	(517)835-2234

STANCE

President	Claudette Tischler	226-5644

Membership dues $12 per Year with a one time sign up fee of $13. STANCE club meetings are held every third Monday of each and every month at B & G Electronics, (located at 15729 Madison Ave., Lakewood, Ohio 44107) starting at 7:15PM

ST☆R
ST ATLANTA ROUNDTABLE

STAR (ST Atlanta Roundtable) Atlanta, Georgia, meets the third Monday of each month at 7PM. Membership dues are $30 per year. Each member receives a copy of AIM and PD disks. Bring a friend.

President	Rick Ostapower	404-487-4845

ST Atari Road Runners

THE #1 ATARI USER GROUP IN THE NEW HAVEN (CT) AREA

President	Madelon Wilson	(203) 735-6711
15 John St., Ansonia, CT 06401		
ST.A.R.R. BBS		(203) 421-4861

Membership in ST.A.R.R. includes a one-year subscription to A.I.M. and access to a large public domain library. Membership dues are $20 per year, and membership is open to all interested users. We meet on the third Thursday of each month (except August) at The Greater New Haven State Technical College, 88 Bassett Road, North Haven, CT.

STUN

The ST Users Network — supporting users of the Atari ST, Mega, and newer technology Atari computers. Open meetings are held on the 3rd Wednesday of each month at 7P.M. in the Murray High School. Send correspondence to: STUN, P.O. Box 27285, Salt Lake City, Utah 84127.

President	Randy Larsen	(801)967-0209
STUN's BBS "The Bolt"		(801)272-4243

SHAREWARE for the Atari 8-Bit

The File Information Program

An easy to use disk library database manager developed for the Atari Clubs of Denver. Fast interactive search capability. Detailed descriptions of files possible. Docs included. $12.50

The Disk Labeler

Uses a variety of label sizes. Add Printshop Icons and use any 9 sector font file. Docs included. $10.00

TEX

Easily read text files a page at a time or jump 10 pages forward or backward using only three keys. Not limited by memory. Options include: Word-wrap, leading space deletion, first page, and last page. This program works best if run from a Ramdisk. Even when run from a floppy it is very fast. DOC's included. $5.00

If ordered together $24 for all three programs.

Send check or Money Order:
c/o Larry Richardson
P.O. Box 472
Aurora, Co. 80010 V

FREE UPDATES for 1 year, full support for both programs through the Atari Clubs BBS: (303)-343-2956 .

Salinas Valley Atari Computer Enthusiasts

SVACE is the only Atari user group in the Monterey Peninsula area. There is a free disk of the month for all attendants, please bring your own disk. Dues are $12 per year and includes Atari Interface magazine. Meetings are at 7:30 P.M. on the first Tuesday of the month at the Salinas Community Center. Demonstrations and raffles are a regular part of our meetings.

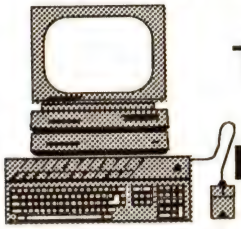
SVACE can be contacted at 672 E. Romie Lane, Salinas, CA 93901. Anybody interested in Atari computers is welcome.

President	Gary Klugman	(408) 758-4894
BitStream BBS		(408) 449-2150

SWAG
Southwest Washington Atari Group

The Southwest Washington Atari Group has been holding its meetings at 6:30 p.m. on the last Sunday of the month (save July) at Clark County Fire District #5, Station 3 on 213 NE 120th, Vancouver, WA. Annual dues are $12 and SWAG can be contacted at PO Box 1515, Vancouver, WA 98668.

Allan Coker	President
The Bear Cavern BBS	(206) 574-1146



THUNDER BAY ATARI ST ENTHUSIASTS

Yearly membership fee of $25 includes 6 issues of the TEAC newsletter, the TEAC Educational 8-bit Disk Library catalog and a one year subscription to Atari Interface Magazine. For more information, contact TEAC at PO Box 1024, Laytonville, CA 95454.

TACE
TINKER ACE OF OKLAHOMA

Tinker ACE of Oklahoma meets the first Saturday of each month at 1 PM (12:30 set-up time) in the Moore Public Library, 225 S. Howard, just off of SW 4th and I-35 in Moore. TACE can be contacted at 16564 SE 18th, Choctaw, OK 73020 or at the TACE BBS (405) 366-1977. ST & 8bit support. Dues: Full - $15, Correspondence - $7. Dues are prorated with renewal each July.

President	Ron Hamilton	(405) 387-5649

TEAC
The Educator's Atari Club

President, Neville Denetto, 185 Varsity Row, Thunder Bay, Ontario, Canada P7B 5P2.

WACO
WESTMORELAND ATARI COMPUTER ORGANIZATION

Westmoreland Atari Computer Organization meets the second Tuesday of each month in the North Huntingdon Township Town House, Center Highway and Brownstown Road (just off Route 30 near the Hamilton car dealerships, Irwin, PA) at 7:30 P.M.

The $20 annual membership ($24 for family) now includes a subscription to AIM, as well as the vocal, consumer-oriented WACO Printout newsletter.

WAUG!

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 pm in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor.

Club dues are $15 per year and provide access to the PD library and subscription to AIM. Meetings feature demos of both 8bit and ST software and hardware. Nonmembers and questions are welcome. Officers can be contacted by calling Craig Harvey at (313) 971-8576 or by BBS at Molin's Den at (313) 451-0524.

WAUG
Windsor Atari Users' Group

Our club meets every third Thursday from September through June with the exception of December when we meet on the second Thursday so as not to conflict with Christmas scheduling. We meet at 7:30 p.m. at the Roseville Gardens Community Centre, 6500 Roseville Garden Drive, Windsor, Ontario, CANADA.

Our club dues are $25(Canadian) per family membership. Each membership entitles you and your family to attend our regular meetings, as well as receive the AIM magazine as well as our own monthly publication, 'exSTracts'.

President	Brian Cassidy	(519) 966 0305

WNY UG

WNYAUG meets at 7:30 pm on the first Thursday of each month in room 116E, Bacon Hall at the State University College of Buffalo Campus, 1300 Elmwood Ave.

Dues are $15 for new members and $12 for renewing members. Send checks and correspondance to WNYAUG, PO Box 59, Buffalo, NY 14216.

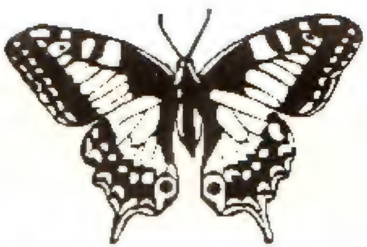
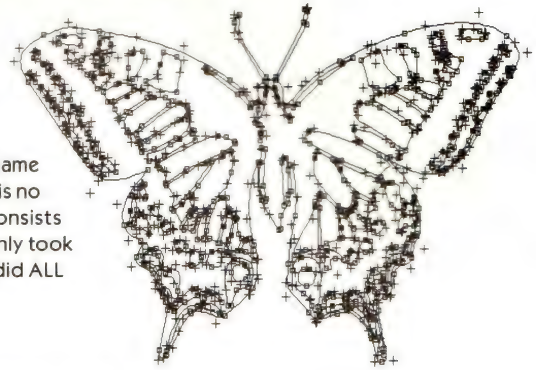
THE COMPUTER STORE THAT ==RUNS TO YOU!

This small butterfly is unremarkable. The others are a new species you can breed on your Atari computer.



To the left is a pixel-based .IMG picture. In other words, the picture is made up of dots. It's a 58k file. The image can't be enlarged much more than this without the ragged edges showing. (In fact, they're showing already.)



To the right is a snapshot of the same image after it has been traced. It is no longer made up of dots. It now consists of lines and bézier curves. This only took a few minutes and Avant Vector did ALL the work for you.

True vector tracing has arrived.

Avant Vector is a cutting-edge graphics tool that's fast, easy to use and surprisingly versatile.

The large butterfly wing on the right is a vector image created by Avant Vector. Using "automatic tracing," a bit image graphic (the smaller butterfly) was converted to a vector graphic, resulting in the smooth output you see here.

Vector graphics have big advantages over bit image graphics - they make much smaller files, and they can be scaled to any size without losing resolution or looking blocky. And Avant Vector's tracing routines are highly sophisticated; in a recent review of 7 Mac, PC, and ST auto-tracing programs, Avant Vector was rated best of the bunch! This means there's less editing after tracing an image, and you get more work done in a shorter time.

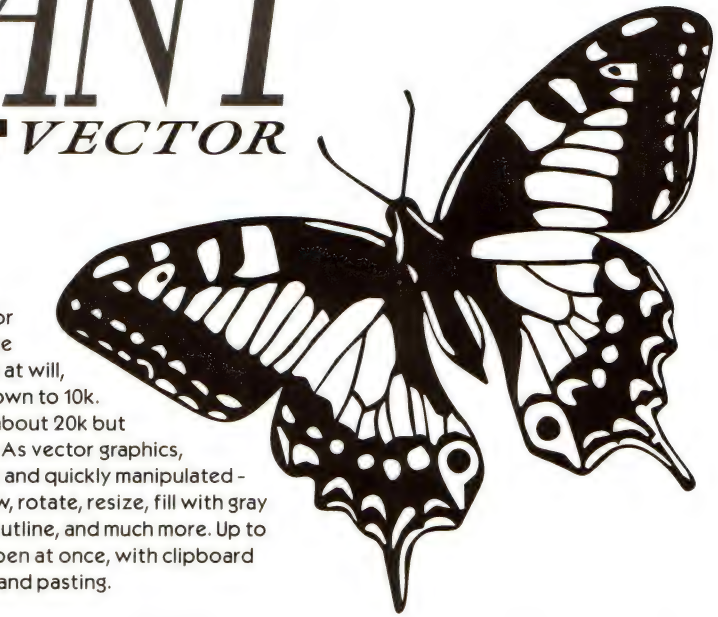
Avant Vector supports .PI3, .PC3, .IMG, .BLD, .PIC or .PAC formats. You can trace Mac, PC or Amiga graphics, in .TIF, .IMG or .IFF formats. The plotter version (Avant Plot) can also load and save HP plotter files.

No matter which DTP package you use, Avant Vector is a wonderful companion. It creates .CVG files for Outline, Calamus or Repro Studio. And .GEM files for use in programs that support GEM3 metafiles. Avant Plot allows EPS importing and exporting, and a full range of professional plotting, drawing and cutting options.

Since Avant Vector is a full featured vector graphics package, you can touch up any picture you've auto-traced, or draw pictures from scratch - with an intuitive, speedy interface you'll learn in a matter of minutes!

Call or write CodeHead Software for more information about Avant Vector (and its amazing cousin, Repro Studio). Special introductory pricing is available until December 31, 1991. Act now and save!

AVANT VECTOR



This is the .CVG vector version: it can now be enlarged or reduced at will, and the file size is down to 10k. The .GEM version is about 20k but otherwise identical. As vector graphics, the images are easily and quickly manipulated - you can stretch, skew, rotate, resize, fill with gray scale percentages, outline, and much more. Up to 7 windows can be open at once, with clipboard features for cutting and pasting.

This is Word Writer running under MultiGEM...

"It's like MultiFinder* for GEM**"

Many of our customers feel this way after using MultiGEM. A true multitasking system for the Atari ST, STE and TT computers. Run up to six GEM, TOS, ACC or TTP programs all at the same time. TOS and TTP programs run in their own GEM windows. Run accessories right from the "Desk Top". Adjust and allocate memory to any program running under MultiGEM. MultiGEM is completely compatible with most Atari programs. Imagine downloading files with your telecomm. program, printing out a document with your word processor and working with a DTP program all at the same time. It is possible using MultiGEM! MultiGEM is a TRUE multitasking "OS" that is flexible and easy to use. *Works great with CPU accelerators like Fast Technology's T-20.*

Only $99.95

MultiGEM Utilities Disk #1

The MultiGEM Utilities were designed to enhance MultiGEM's performance. There are four programs included in the MultiGEM Utilities Disk #1. MuliMAT will allow you multask format a floppy disk. With Multi-Copy you can multitask copy files. Multi-Print will let you multitask print ASCII text files. Multi-Launch is a complet program launching system that will allow you to run other programs from within any GEM program. These utilities are a must for MultiGEM users.

Editor — Bill Rayl
Contributing Editors
Paul Alhart, Ed Hall,
Tim Holt, Dave Plotkin

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

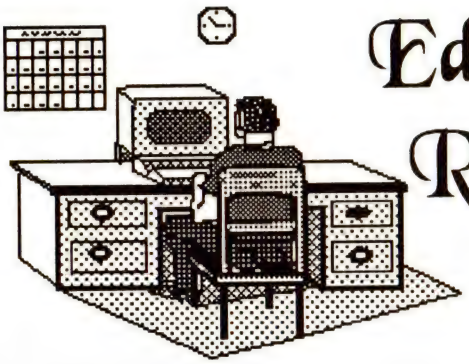
Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.



Editorial Ramblings

Our hopes for a Happy Holiday and the best of New Years for all our readers!

AIM finishes off another year of supporting Atari users. This year has been an eventful one, especially for magazines. We've seen Antic merge into STart, then STart ceasing publication altogether. ST Journal changed into AtariUser, and Atari Explorer is roaring back after some earlier difficulties.

We look forward to another year of Atari excitement— with the ST Notebook, the STylus and a new TT. Personnel at Atari headquarters has been fairly stable, so we may see some earlier laid plans have time to bear fruit.

Also this year, we've seen prices drop on peripheral items. Laser printers are more affordable, and even color scanners are under $1,500 now! Damark even has a dual standard OkiData 9600 baud modem for sale for $299! This would make a great gift for your telecommunications addict! For more information, call Damark at (800) 729-9000.

A membership to CompuServe or GEnie may be a good gift for your favorite Atari user. These online services keep Atarians up-to-date on what's happening in the Atari market. 9600 baud users may want to look out for hidden connect charges with GEnie, though. Basic* Services doesn't apply to 9600 baud callers. Charges for non-prime time use are $18/hour (three times the 1200/2400 rate) and prime time use is $30/hour. With CompuServe, charges are $22.50/hour anytime! That's less than double the rate for 1200/2400 baud, and you're connecting at four times the speed. For more information on CompuServe, call (800) 848-8199. For information on GEnie, call (800) 638-9636.

Next month, look for a review of PageStream 2.1, Soft-Logik's new font and business forms packages, PageAssistant from Spar Systems, the Chicago ComputerFest by Atari and much more!

ATARI BULLETIN BOARD

MegaPaint Professional

CodeHead Software has announced availability of MegaPaint Professional, a full-featured bit-map and vector graphics tool for Atari ST and TT computers. Megapaint features some unique editing tools, such as for creation of rhomboids, equilateral polygons with 3 to 32 sides, circular or elliptical ring sections, perpendicular and parallel lines, concentric circles and bezier curves. The package also boasts extensive text support using bitmapped and vector fonts, powerful block and lasso functions and a whole lot more.

MegaPaint also supports "virtually all printers." Printer drivers supplied with the program can be easily edited to adapt to any printer. Pictures can be loaded in MegaPaint's .BLD format, standard .IMG format, MS-DOS .PCX format, Degas 32K format, or STAD format (.PAC). Vector graphics can be exported in CVG format.

MegaPaint is designed to be easily expandable via external modules, and import and export modules are already in the works for several other picture and vector formats. The program runs on any ST/TT with a monochrome monitor in resolutions from 640x400 up to 8192x8192 and even supports networking and scanners! MegaPaint retails for only $175. CodeHead Software, (213) 386-5735 voice, (213) 386-5789 FAX.

STalker Offer!

Gribnif software has a special offer for all CompuServe users—for a limited time, CIS users can purchase their excellent STalker 3.0 telecommunications program for only $39.95! STalker sports such features as the ability to run as an ACC or PRG, built-in Xmodem, Ymodem and Zmodem file transfer capability, an excellent Scripting language, and GDOS font support. Two of STalker's best features are its multiple port support (be online at two or more locations at the same time!) and the ability to run in the background.

To take advantage of this offer, call Gribnif Software at 1-800-284-4742 and mention you are a CIS user wanting the "CompuServe Special" on STalker (or send CompuServe E-Mail to 75300, 1131 for additional information.)

Migraph News

Migraph has updated their popular Touch-Up software to version 1.65. The new version has a "Save as Gray" option that turns dithered patterns from the Migraph or Golden Image hand scanners into gray shades. Now, you can save 16 level true gray scale IMG or TIFF files, 31 level "apparent" gray scale IMGs or TIFFs, or even full 32 gray shaded TIFF images!

The big advantage to gray scales over dithered patterns is that grayscale images can be resized without distortion. To upgrade to the new version, return your original Touch-Up disks to Migraph along with payment—$24 if upgrading from version 1.5, $44 if upgrading from version 1.0.

Also available from Migraph is the Merge-It and Scanning Tray hardware/software combo. The Scanning Tray consists of a molded plastic tray (which holds artwork in position) and a cradle (which holds the scanner head). Using the Scanning Tray, the user can accurately scan a full page in two strips. The cradle is designed to hold the Migraph, DFI, Genius, Golden Image, Logitech, Marstek 105 or Complete Hand Scanners.

Merge-It is a software utility that merges the two strips into one complete image. The program can be used as a program or a desk accessory. Retail price for the Scanning Tray and Merge-It combo is $149.

Scan & Save, another Migraph release, provides the capability to scan and save an image without all the editing/conversion tools found in Touch-Up. If you have a system with little memory or don't need editing capabilities, this is the program for you. Scan & Save can be used as a PRG or ACC, works with the Migraph or Golden Image hand scanner and has the same gray scale saving options of Touch-Up 1.65. Retail price is $20.

By the end of the year, Migraph also plans to ship an OCR (Optical Character Recognition) package for the Atari ST/TT line. Contact Migraph for details, (206) 838-4677 voice, (206) 838-4702 FAX.

Sales-Pro Update

Sales-Pro, the popular Point-of-Sale/Inventory Control system from Hi-Tech Advisers has been updated to version 6.00. New features include integration of General Ledger functions, ability to set percentage discounts and taxable/nontaxable status on a customer-by-customer basis, support for three separate sales tax levels and much more. Sales-Pro ships in single- or multi-user configurations, and a number of external modules and accessories are available. For more details, contact Hi-Tech Advisers at their *new* location—PO Box 128, Ravena, NY 12143-0128, (518) 756-3800 office/non-US orders, (518) 756-6666 technical support, (518) 756-3539 FAX, 800-882-4310 US orders.

Typeface Library

Soft-Logik Publishing Corp. has released the new Soft-Logik Typeface Library. Soft-Logik has licensed 600 Postscript Type 1 fonts (as well as EPS graphics) from Image Club, a leading developer of Postscript fonts and clip art on the Macintosh.

The new Typeface Library currently contains four bundles. Newsletter Fonts and Starter Fonts each contain eight Type 1 fonts and retail for $99.95. The Classic Fonts and Designer Fonts packages each contain 16 Postscript fonts and retail for $199.95. Soft-Logik Publishing Corp., (800) 829-8608 orders, (314) 894-0431 technical support, (314) 894-3280 FAX, (314) 894-0057 BBS (3/12/24/9600 baud).

Double Click

One of the hottest new products to be released is Data Diet from Double Click Software, especially if you are a hard drive owner. The Data Diet package offers "real time data compression and uncompression" of all your files—text files, word processor or DTP documents and executable files. What this all boils down to is that all your files take up a whole lot less space on your drives. If you're a hard drive owner, using Data Diet can give you back well over 60% of your hard drive's space, based on our initial tests. For a 40 meg hard drive, that's better than adding a second 20 meg drive to your system! Retail price is only $74.95, and that's a lot cheaper than a second hard drive.

Double Click will also be shipping the Game Workbench soon. This "game authoring system" allows practically anyone to write commercial quality games quickly. Games written under the Game Workbench can include such things as digitized sound, scrolling, sprites and animation sequences. Contact Double Click Software, (713) 977-6520 voice, (713) 944-0108 BBS.

Index Legalis

Ralph Turner has written the Third Book of Atari ST Topics, and it is another "must have" addition to your reference library. Following in the successful format of The Atari ST Book and Intermediate and Advanced Atari ST Subjects, Turner's third book deals with complex topics in plain English. The new books covers topics such as the TT030 and Mega/STE, modems and telecommunication software, laser printers, CompuServe and GEnie, null modems, MIDI keyboards and sequencing software, bulletin board systems, and PD and Shareware. Suggested retail is $16.95. Index Legalis, PO Box 1822-3, Fairfield, IA 52556, (515) 472-2293.

Grammar Expert at 1.10

Phil Comeau Software announced the release of version 1.10 of the Grammar Expert program for the Atari ST/TT. Grammar Expert is an online reference for the rules of English grammar, punctuation, and effective writing. The package is a highly useful aid for both professional and casual writers. As a desk accessory, Grammar Expert is accessible while in your favorite GEM-based word processor.

Grammar Expert is like a computer-based reference book, with information presented in pages, a table of contents and an index. Using a "hypertext" environment, users can quickly flip from page to page or click on cross-indexed words to jump to a section in the "book" containing more details.

Version 1.10 contains several improvements to the software, including text pattern searching of Grammar Expert's table of contents; user-selectable display of cross-indexed "links" as bold, inverse, underlined and/or colored text; addition of a number of keyboard shortcuts; and saving of window position and size, as well as current window positions for the index and table of contents. Suggested retail is $59.95 US ($66.95 Canadian). Registered owners of 1.0 can upgrade by sending in their original disks with $5. Phil Comeau Software, (613) 825-6271.

Tracker Update

Version 3.0 of Tracker/ST, the leading mailing list/mail merge package for the ST/TT series, is now available from Step Ahead Software, Inc. Some of version 3.0's new features include one-click telephone dialing (modem required), duplicate name warning when adding names, the ability to copy a single record from one database to another with a simple keyboard or mouse command, completely unlimited filtering and a powerful new report which prints out Tracker/ST's unique Long Notes for as many people as the user requires, with one single command.

Other new features in Tracker/ST 3.0 include the ability to export names in any format (for use with WordPerfect, WordUp, WordFlair II and virtually any other word processor or database), expanded default settings and the ability to retain Tracker/ST's extended Long Notes when doing an export and import within the program. Author Nevin Shalit says he's taken all the suggestions offered by registered Tracker/ST owners and implemented every one of them in version 3.0!

Until the end of 1991, Tracker/ST 3.0 will be available for the same $79.95 price as earlier versions of the program. On January 1st, 1992 the retail price of Tracker/ST 3.0 will be $99.95. Registered owners of Tracker/ST 2.0 and greater may upgrade to 3.0 for $25 ($30 after 1/1/92). Users should not send in their original disk, but must include their completed registration card with their upgrade order if they have not already sent in their card. Step Ahead Software, 496-A Hudson Street #F39, New York City, NY 10014, (212) 627-5830.

IAAD News

Speaking of Nevin Shalit, Nevin was elected President of the Independent Association of Atari Developers (IAAD) at a meeting of the IAAD during the WAACE Atarifest. Shalit replaces Nathan Potechin of ISD Marketing, who stepped down after serving as President for the first two years of the IAAD's existence.

The IAAD is a group of registered Atari developers who work together in various marketing, instructional, and educational areas. Currently more than 50 developers make up the IAAD, which includes representatives from Canada and Europe as well as a full complement of US developers.

"I look forward to building on Nathan's excellent work in the coming year, by increasing our membership, and having IAAD members work together on specific projects which will benefit developers, dealers, end users, and Atari itself," says Shalit.

IAAD business is conducted mostly on GEnie. Developers interested in joining the organization should send E-mail to PERMIT$.

ATonce 386SX for Mega/STE

Vortex of Germany has released ATonce-386SX, a 386 IBM PC emulator for the Atari Mega STE. The emulator fits into the 68000 socket and requires no soldering. The board includes a 32 bit CMOS 80386SX 16MHz CPU and optional sockets for 512K of "Vortex Fast RAM" or 80387SX-16 math co-processor. Norton's SI rating of the emulator is 12.3 without the Fast RAM or 15.6 with the Fast RAM option.

Supported graphics modes include monochrome EGA/VGA, CGA, Hercules, Olivetti and Toshiba T3100. ATonce-386SX also supports hard/removable disks, 360K/720K/1.44MB floppies, serial ports, parallel port, mouse and clock, as well as sound support. For details, contact Vortex Computersysteme GMBH, Falterstrasse 51-53, D-7101 Flein, Germany, 07131 - 59 72-0 (within Germany—add international code and drop first zero for calls of non-German origin).

2600 Connection

The 2600 Connection, a newsletter devoted entirely to Atari 2600 owners/collectors, has now switched from a quarterly to a bi-monthly schedule. The newsletter has grown considerably in popularity since its first issue. Each issue of The 2600 Connection contains solutions, tips, and hidden messages in games, classified ads from other collectors/gamers, game reviews and more. A 6-issue subscription costs $6 and a sample issue is available for only $1. The 2600 Connection, 14 Blackburn St., Fairhaven, MA 02719-4334, (508) 997-1983.

Right on Target

David Plotkin
Contributing Editor

With the gift-giving season upon us, the friends or loved-ones of an Atari owner can count their blessings! Buying a gift for one of us is easy, and relatively cheap.

Unlike our bretheren who own PCs or Macs, accessories—even big ones—are quite reasonable. They are also not that hard to find—just check the pages of this magazine for some great mail-order buys—or check out your local Atari dealer if you are lucky enough to have one.

Best Trackballs

Those who don't have a lot of room on their desks, should consider the option of a trackball instead of a mouse.

The problem is that most trackballs are quite clumsy. They require that you move the ball with the palm of your hand, which makes it quite difficult to keep your fingers on the buttons that substitute for the mouse buttons.

The Best Trackball, however, solves this problem by placing the ball under your thumb. Thus, you can roll the trackball with your thumb, keeping your fingers on the buttons with no problem. As with any trackball, it takes a little getting used to, but adjusting to it is easier than any other trackball I've tried.

It costs about $55, and is available from San Jose Computer (408) 995-5080.

The More Things Change...

Remember the cordless mouse from Practical Solutions? It transmits its signals to a small receiver by infrared. As long as the mouse doesn't get too far from the receiver, it works pretty well. The shape of the mouse is really nice, too—it is small and rounded in all the right places.

Unfortunately, Practical Solutions went out of business some time ago.

Now, an outfit called Golden Image has come out with a cordless mouse that looks *exactly* like the Practical Solutions mouse, except that it has three buttons in the advertisement.

Strangely, the ad touts it as a two-button mouse. In fact, the similarity between the Golden Image mouse and the Practical Solutions mouse makes me wonder if the guys from Practical Solutions didn't start a new company.

The cordless mouse is $89.95, and they also have a cordless trackball.

The Golden Image hand scanner is packaged with Migraph's Touchup at a very attractive price—$199. Compared to Migraph's handscanner, this is quite a bargain. Just make sure you have a lot of room on your hard drive—scanned pictures can chew up space! Golden Image can be reaced at (800) 327-4482.

Hard Drives

Speaking of hard drives, Toad Computer has what every ST/TT owner will drool over—all different sizes of hard drive configurations, including drives with removable cartridges for virtually unlimited storage.

The Toadfile 44 Plus is $699, with 44 meg cartridges selling for $89. You can also get a variety of case configurations, and combinations of removable/fixed hard drives in one case. Toad has really built a reputation for providing good service and support.

You *do* have to wonder, however, where they got a name like "Toad." Of course, there are lots of names that don't seem to have any meaning right off (such as Gribnif, ICD, CodeHead, etc.). (800) 448-TOAD is the number to call for orders.

Incidentally, Toad has come out with a monitor switch so that you can switch between a color and monochrome ST monitor. The Toadswitch is $39.

I have a switch like this from Astra (SW2), but they are another Atari vendor that is long gone. If memory serves, Practical Solutions also had a monitor switch. Oh well.

Emulators

Emulators have become big business, and can especially be appreciated if your Atari enthusiast has to use one of those "other" computers at work.

On the Mac side, there is, of course, Spectre GCR. This amazing product (in case you've been hiding in a cave for about three years) turns your Atari ST into a Macintosh. It includes the ability to read and write Macintosh format disks. It works very well, with better than 95% compatibility with Mac programs. The catch seems to be that the Mac ROMs that it requires are scarce, ever since Apple clamped down on the supply of both real and bogus Mac ROMs.

The PC emulator business has boiled down to two main companies. The Supercharger PC emulator is an external box that is available through Talon Technology and RIO Computers. Its advantage is that it sits outside the ST and is quite easy to hook up, requiring only a cable to chain into the DMA.

There have been promised enhancements for it, including an AT (80286) modification and a VGA card. Recent ads from RIO Computers have pricing for 12 MHz and 16MHz 286 versions of the Supercharger (called SCplus/286), but I have not personally seen these versions.

The other PC emulator is an internal board, termed "PC Speed." It has an AT version called "AT Speed." Both these products have good reputations, based on a variety of reviews—and the Supercharger I can vouch for personally.

Software

Software always makes a good gift, and there are some real bargains out there. Besides such powerhouses as LDW Power spreadsheet (now in version 2), ISD's Calamus SL and Soft Logik's PageStream 2.1 desktop publishing packages, Superbase 3 database and WordFlair II and WordPerfect, there are hosts of utilities that can make your life easier and more productive.

Almost anything from the Codehead line will be welcome (special emphasis on MultiDesk Deluxe, Hotwire and Popit), and let's not forget the Double Clicks!

DC Shower has become one of my favorite programs, letting me display any text or graphics file right from the desktop. The DC Data Diet program can compress files when they are saved to your hard drive, and decompress them automatically when you load the program, thus saving valuable disk space.

Rimik Enterprises' DT Paint is a full featured paint program that can run as a Desk Accessory. Kyle Cordes has come out with Abbreviator, which expands your abbreviations into full words—very handy if you do a lot of writing.

And then, of course, there are the games. Acres and acres of games. Some really good older titles can be picked up for as little as $5, and many more for $10. At these prices, you can afford to pick up the inevitable occasional dud.

If your favorite gamer likes to take their games with them, then a Lynx might be a nice idea. The newer version has a longer battery life, is smaller, and sells for about $100. Now, if Atari can just keep the supply of new games flowing.

What About AIM?

Or, you can buy a subscription to AIM—for all the Atari news that's fit to print (or is it "all the Atari news that fits?"). There is no better way to keep up with the world of Atari than to read up on your favorite vendors, services and products, not to mention their great PD/Shareware Disks of the Month.

Along with Atari Interface, subscriptions to other Atari specific publications like Atari Explorer and Current Notes also make great gifts.

Have a nice holiday season, and we'll see you next month!

GAME WORKBENCH

Now you can write commercial quality games in a fraction of the time professional programmers need.

The complete Game Workbench system integrates sophisticated tools with all the best professional animation, scrolling, sprite manipulation and digitized sound techniques currently used by expert game programmers. Simply the easiest, most advanced game authoring system available anywhere.

Available Christmas 1991.

Write top quality games like Dungeon Master or Speedball II without learning assembly language!

Eight Bits of Atari History, Part 3 or The Way It Might Have Been

Ed Hall
Contributing Editor

Another lasting impact of the calculator wars was the lesson it taught Jack Tramiel—the importance of being vertically integrated.

This month, let's focus on Jack Tramiel and Commodore's impact on the marketplace under his "rule." Then, we'll finish up this installment with Tramiel at Atari.

Commodore Buys Apple!

The success story of Jack Tramiel, founder of Commodore Business Machines, is even more remarkable than that of Steve Jobs.

Born in Poland in 1928, he spent a major portion of his teenage years in the Nazi death camps. For him, there was no need of a pilgrimage to India to give meaning to his life, and his diet while at Auschwitz was not an experiment.

Tramiel became a survivor. This experience toughened him for survival in the business world, and especially in the personal computer market, where the pressure can be brutal.

Michael Tomczyk, a former Tramiel aid, observed that working at Commodore, or any other computer company in those days, was like being in a real-life videogame game—one slip, one false move, and you're dead.

At Apple, Steve Jobs frequently wept, while Tramiel, whose personal battle cry became, "Business is war," was once physically attacked by an employee who broke under the strain.

Apart from the difference in their ages and backgrounds, there are many interesting similarities between Jack Tramiel and Steve Jobs.

Both are equipped with powerful personalities, both employ confrontation as a management tool, and both are able to infuse in others their own compelling vision of the future. So powerful was this in Jobs that co-workers at Apple called him "the reality-distortion field."

At Commodore, Tramiel preached a brand of hard-nosed business that became known as "The Religion." Though his rule was paternalistic and autocratic, he was able to instill great loyalty among his top workers.

After coming to America, Tramiel started a typewriter repair shop and soon branched out into adding machines.

When the first microprocessors were developed in the early 1970s by Intel and Texas Instruments for use in calculators, it seemed a natural product for his company to get into. Commodore began selling a line of calculators based on a Texas Instruments chip. When Texas Instruments itself entered the market with its own calculators, it crushed most of its competitors and Commodore nearly went under.

Tramiel found a way to survive. He withrew from the American market and concentrated on his native Europe. There he built up a loyal following of customers whose brand recognition would soon carry them from Commodore calculators to Commodore computers.

Meanwhile, back in America, the calculator wars of the 1970's had two key impacts on the future development of personal computers.

First of all, it plunged into debt a small businessman named Ed Roberts. In a desperate attempt to turn around his company's fortunes, he decided to offer for sale a computer kit called the Altair. It was the first ever commercially available personal computer, and it launched the personal computer revolution.

Another lasting impact of the calculator wars was the lesson it taught Jack Tramiel—the importance of being vertically integrated.

Or in other words, don't depend on other companies for essential parts. Tramiel borrowed heavily in order to acquire MOS Technologies, thus providing a secure source of chips for Commodore calculators and watches. It was one of Tramiel's most brilliant moves.

As it happened, MOS Technologies had just developed a new microprocessor, the 6502. Intended for use in a computer, it was significantly cheaper to produce than the other leading chip on the market, Intel's 8080. To exploit this new chip, Commodore decided to enter the personal computer market. But before building their own machine, Tramiel decided to check out a computer already being developed around the 6502. He sent Chuck Peddle, the man who designed the 6502, and Andre Sousan, Commodore's VP of Engineering, to see Steve Jobs. Acquiring the Apple II would save Commodore a lot of development time.

Steve Jobs was ready to sell. He asked for $100,000, some Commodore stock, and employment for himself and Woz. But Jack Tramiel figured this was too much for a product being developed in a garage, and nixed the deal. Later, both Peddle and Sousan would defect to Apple.

In the meantime, however, Tramiel challenged Peddle to come up with his own design, and in 1977—the same year the Apple II and the Radio Shack TRS-80 Model I were introduced—the Commodore PET came out.

Commodore went on to corner the low-end home computer market, a success due in no small part to its "vertical integration." Thanks to Tramiel, Commodore was ready for combat when the dreaded Texas Instruments brought out its own personal computer. In the ensuing home computer wars of 1982-83, Tramiel had the satisfaction of crushing his old foe and driving Texas Instruments out of the personal computer marketplace.

In the process, Atari was badly mauled as it tried to keep pace with the savage competition.

Commodore's chief weapon in the home computer wars was the C64, a low-cost computer which matched the Atari 800 in graphics and sound. In 1983, Atari countered with the XL line, whose first model (the 1200XL) flopped miserably. The 800XL became Atari's main computer, but as the name suggests, it was basically a revamped 800. Though a good product, the 800XL offered no technical advancement over the Commodore 64. Even worse, Atari could not market it cheaper than the C64, because Atari was not vertically integrated.

Atari had become too moribund to find the kind of solutions it needed to remain an industry leader. In 1983, for example, rumors began to surface of a new computer with fantastic graphics and sound, a machine that many dubbed the 800's older brother because it incorporated custom graphics chips designed by Jay Miner.

Codenamed "Lorraine," this new product had started out as a game machine, but after the game market collapsed, it was converted to a computer. It was being developed by a small company called Amiga, whose greatest achievement up to that point was a device called the joyboard—a foot-operated controller that came packaged with a surfing game.

Not only was the company set up by former Atari employees, but it also obtained a loan from Atari to assist with the development of the Lorraine. It was precisely the sort of product which Atari itself should have had under development.

Atari, however, was not the only company making mistakes. Commodore followed up on the twin successes of its VIC-20 and the 64 with a pair of colossal flops—the Plus 4 and the 16. This caused dissension in Commodore, and early in 1984—at nearly the same time that Steve Jobs was triumphantly launching the Macintosh—Jack Tramiel abruptly resigned.

Commodore stock fell and suddenly its future was uncertain, especially when Tramiel resurfaced six months later and bought controlling interest in Atari. A number of key people followed him there—in addition to his three sons, there was Greg Pratt, Sig Hartmann, Elie Kenan and others. One of them, Shiraz Shivji, led the team of engineers who produced the ST computer in a miraculous six short months.

When Tramiel took up residence in Sunnyvale, he was paid a visit by Amiga Corp. They now had a working prototype of the Lorraine, but they needed more capital to bring it to market. Was Tramiel interested in acquiring it? Tramiel was, but the offer he made wasn't to their liking, so off Amiga went to Commodore.

Commodore, however, was preoccupied by the upheavals which followed Tramiel's departure, and showed no interest.

Reluctantly, Amiga returned to Atari to accept Tramiel's offer, but were stunned to learn that it was now much less than before. With the ST under development, Tramiel had no need for another 68000-based computer. Besides, Amiga still owed Atari money, and if they defaulted on the loan, Atari would pick up Amiga's assets anyway. Amiga stubbornly refused to cut its losses, and for the second time left Atari without making a deal.

At the last minute, on the same day the loan was due, Commodore roared in and snatched the Amiga from under Tramiel's nose for $25 million.

Atari and Commodore exchanged lawsuits—Commodore claiming that ex-Commodore employees who followed Tramiel to Atari had taken with them trade secrets, and Atari disputing ownership of the Amiga.

The ST debuted exactly a year after the Mac, and it was dubbed the "Jackintosh" by the press. The Amiga came out later in 1985, but the ST had stolen much of its thunder.

And like the Macintosh, Amiga sales were initially disappointing.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$\$39^{95}$

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$\$14^{50}$ ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$\$25^{00}$

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$\$14^{95}$

800 5 PIECE BOARD SET

Includes Main Board, Power Board CPU, 10K O.S. and 16K RAM Board. All boards new, tested and fully populated. Set includes instructions that will allow you to repair ANY 800 Computer $28.50

1050 REPAIRS

We are now offering a limited repair service on the Atari 1050 Disk Drive. Please call our Service Dept. at 510-352-3787 for a Repair Authorization Number. Units without RA# will not be accepted. Service rate . . $69.95

SpeedScript Word Processor	$14.95

850 BARE PRINTED CIRCUIT BOARD

Bare Circuit board for Popular 850 Serial/Parallel Interface allows the experienced Technician to assemble an interface to hook up a wide variety of standard Modems and Printers. Includes Parts list and special crystal. ROM code not included. $4.50

850 12 Piece Chip Set w/o ROM $12.50

Buy both the above and get a Power Pak for $5.00

PRINTER INTERFACE

MICROPRINT INTERFACE ALLOWS YOU TO CONNECT ANY STANDARD PARALLEL PRINTER TO YOUR ATARI 8-BIT. WORKS WITH 800XL, 130XE, 800/400, 65XE, XEGS, 600XL. (1200XL requires easy modification). $43.95

BOOKKEEPER & KEYPAD

You get both Atari's 8 bit professional bookkeeping system and the handy CX85 numeric keypad for one low price. Packages Factory sealed

$\$19^{95}$ 4 DISK SET

VISICALC SPREADSHEET

Unleash the computing power of your 8 bit Atari with Visicalc. Compute everything from home finances to high powered financial projections. Hundreds of uses.

$\$19^{95}$ DISK

Super DataBase 1-2-3

INNOVATIVE PRODUCT CREATES AMAZING DATABASE APPLICATIONS EVEN IF YOU HAVE NO PROGRAMMING SKILL. ONCE YOU CREATE A PROGRAM WITH SUPER DATABASE IT BECOMES A STAND-ALONE APPLICATION THAT RUNS ON ITS OWN. "GENERATE" YOUR OWN PROGRAMS TO KEEP TRACK OF EVERYTHING.

INCLUDES 137 PAGE MANUAL - 3 DISKS $\$59^{95}$

P:R: CONNECTION

Serial / Parallel interface for connecting a wide variety of standard RS232 modems and standard Centronics Parallel printers to your Atari 8-bit computer. Direct replacement for the 850 interface. $79.95

P:R: or 850 to Printer Cable . .	$14.50
P:R: or 850 to Modem Cable . .	$14.50

CARTRIDGES

For XL's/XE's 800/400

PAC-MAN Cartridge.	$4.00

So You Want to Start a User Group?

A Primer for Starting Your Own User Group, Part IV

Tim Holt (ACCEPT)

Hello, meet Uncle Sig...

Hello again! Last time out, we looked at some ways to keep your members interested and coming back for more. Hopefully, you saw that using "non-traditional" topics is a good way to keep them coming back. This time, we will look at special interest areas within your group, pros and cons of multiple platforms, and some common problems faced by user groups all over the place.

Each user group has a variety of people in them that can serve as "experts" in a particular area. Why did you buy your computer? Chances are, the guy that is vice president of your club has a very different reason, and that little kid in the back has another reason as well.

Music, games, word processing, data bases, video production, animation, et cetera all are very well served by the Atari platform. The larger your group, the greater the chances of interest fragmentation. This is where the idea of SIGs, or Special Interest Groups, comes in.

Because of time limitations, chances are you cannot cover everything you want to in your regular club meetings. But, who ever said that you were stuck to just the "official meeting" time and places?

When your club has a large enough membership, it is time to start thinking about SIGs. A SIG group can meet at the same time as the regular meeting, a sort of "meeting within a meeting." Or, you can even schedule them at different times, whenever it is convenient for those that are interested in getting together. The SIG can meet at a member's house and can be quite informal.

SIG Suggestions

Whenever there is a special interest held by a few members of your group, there can be a SIG meeting. Let me give you some examples:

Paul, Pete and Suzy all use WordPerfect at work. Well, Paul knows all the WordPerfect tricks, Suzy knows a few less, and Pete just got it slapped on the computer and he stares blindly at the screen at work.

This is a great opportunity to start a SIG. Meet at Paul's house, have a few refreshments, and enjoy going into detail on the single topic of WordPerfect. The entire club doesn't have to show up, only those that are interested in learning WordPerfect. The pace is relaxed, and attendees don't have to talk over the din of the rest of the meeting.

However, it is important that *all* members of the club are aware of this SIG meeting and that they are all welcome to attend if they choose. You don't want to start little groups within your group that feel superior to everyone else. (And we all know how those WordPerfect people feel superior to us peons...evil grin.) Always make the SIGs open to everyone.

Okay, so you have a WordPerfect SIG. Do you see how *any* program that people express an interest in can work here? Let's take another example:

Falcon is (or was) a very popular game for the ST. It is *really* neat if you hook your Falcon game up to another ST through a null modem cable. I can easily imagine a SIG for just Falcon players. They have Falcon tournaments and a Falcon Championship.

Again, everyone in the club should feel welcome to the tourney, but if they do not want to show up, fine. There are several games that allow hookup through cables, like Falcon. MIDI Maze comes to mind immediately.

Just as you can have unlimited types of demos (see last column), you can also have unlimited types of SIGs—a Mac SIG, an IBM SIG, et cetera. The limit again, is your imagination.

However, some warnings about SIGs: You do not ever want the SIGs to become more important than the club itself. If that happens, the people in the SIG will be reluctant to renew their club membership for next year. This is a reason many clubs have SIG meetings inside a club's regular meeting.

You should also make sure that SIGs are directly accountable to the club officers. You must never lose sight of the fact that SIGs are a subset of the club as a whole, and you must make sure the people running the SIGs never lose sight of that, either. If a SIG begins to view itself as outside of the club, it will eventually split off to form an individual club. This can turn into a bitter fight that leaves both factions bruised for years.

Multiple Platforms

There is a serious question for you to consider when you are starting your club—do you wish to limit it to *just* the Atari platform? There are good arguments on both sides, and I will try to present them here. If you decide to go with multiple platforms, you have to decide which platforms to support. Just Macintosh? Just IBMs and compatibles? Both?

Let me tell you what our club has done. We sat down one afternoon and talked about the future of Atari computers. Perhaps it was after a bad week for Atari or maybe Pete's stock dipped into the $1.00 range. Whatever the reason, we decided that Atari was not going to be around in the computer arena for as long as Apple or IBM.

Maybe Atari will be around for as long as our club is in existence, maybe not. We were losing members, many of which were not quitting because they disliked the club, but because they had sold their Atari's and had bought another type of platform.

We wanted to keep members, but we are wise enough to know that folks are not as impressed with their systems as they once were. We changed then and there. Atari Computer Club of El Paso Texas (ACCEPT) became Advanced Computer Club of El Paso Texas (ACCEPT). Any type of computer platform that the Atari ST could emulate was now welcome to join our club.

Has this helped? Yes and no.

Yes, now other members are not afraid to admit that they use IBMs at work, and we now have a real Mac expert at each meeting. No, we haven't gotten many non-Atari members, but we really haven't tried.

To the minus side of this is that you do not want the Atari members, your bread and butter, to be alienated by the new group. Everyone should be equal. You do not want the famous "My computer is better than your computer" argument to rise up. In this case, and really in all cases, anybody's computer is just as good as anyone else's. Be on the lookout for these types of problems.

Problems, Problems Everywhere...

Eventually, you will run into problems. As sure as the sun rises, your club will face the following: No money, apathy, low turnouts and bad demos. Let's look at all of these.

No money—Okay, even though you have 200,000 members and each has paid their membership fee, you find that the costs of newsletters and other fees has drained the treasure chest. How do you raise money?

Well, one of the best ways our club has found was to have auctions. These work by members bringing in used original computer goods and trying to auction them off. In our club, we charge a ten percent fee to the *seller* (based on the final auction price) while the seller gets 90 percent.

You would be surprised how many people have relatively new programs and equipment that they just do not use. Suppose you sell WordPerfect at auction for $75. Well, the club would get $7.50, and you would make $67.50. Not bad, especially if the program is just

COMPUTER BULLETIN BOARD 445-1313

sitting on the shelf collecting dust. I have a rule when deciding what to sell: If I haven't used it in one year, then it goes to auction!

Another nice way of getting money is to raffle off door prizes at 50 cents a ticket (or whatever price you set). You won't get a lot of money from door prizes, but it is money, and could pay for this month's issue of AIM. And they're a reason for people to come to your meetings.

You can also have special raffles, like at Christmas or the club's birthday. Raffle off a Lynx like our club did. Raffle off a Spectre GCR or even a 1040 ST if you wish! Just make sure that the prize does not cost more than the amount of money you will get in the raffle.

A membership drive is another way to get new money. Have a contest. The member that gets the most new members to join wins a prize. If each member gets one new member, you double your membership! Pretty good!

Apathy—Apathy is the scourge of all clubs. I don't know about you, but when I am asking folks to help and only one person out of 20 says boo, I get pretty upset. You can plead, you can beg, you can cry, and they still sit there and look like a bunch of stumps.

I have found the only way to get people to get off their duffs is to just *assign* someone to do something. "Bob, would you do this for me and have it done by Friday?" or "Pete, could you please scan this for me? I really need it."

Just ask. It might surprise you how many actually do what you want. Many club members are like lost sheep, and many are really pretty impressed when the President asks them to do something.

You could go the old threat route, "I won't show up until you guys get to work," but that rarely works. If you do it enough, the club realizes you are crying wolf and won't do anything for you.

Low Turnout—Small attendance at meetings is seasonal. Christmas and summer are the worst. The best way to get folks to show up is to have the best meetings at those times. Have the auctions in July and December.

Also, you can have someone in the club call all the members a couple days before each meeting, reminding them about the meeting. Please make sure, however, that you get someone reliable. The kid that plays games all day probably won't want to spend two hours on the phone calling people he doesn't know.

Don't get discouraged if the meetings don't set attendance records every time. You are going to have low turnouts...you are going to have times when everyone forgets there is a meeting! Our club meets the second Saturday of each month. When that Saturday is on the 8th, our members tend to think that is the first Saturday of the month. Once, we had two members show up at the regular meeting, but 22 showed up the next week, a week late! Get that caller calling!

Bad Demos—Sometimes, an expected demo just will not work. No matter what you do, that scanner won't scan, the hard drive won't boot, etc. Always have a "Plan B." This could be a PD program that hasn't been demoed—like ArcShell or Vanterm—or something like that.

It *will* happen, and it will be embarrassing. However, if the members see that the leaders are on top of things, they will get a warm fuzzy feeling inside and elect you president again next year!

Next time, where to turn for help, and how to keep those pirates out of the club...

Santa Says: It's not too soon to start on those Christmas mailings! Spruce up those pages by ordering the IMG volume ***H3*** : ***Christmas***, four double-sided disks filled to the brim from Electronic Spinster Graphics for only $15.00 (plus $2 S&H). Or order more, like Christian Clip-Art, Jewish Clip-art, Autumn Holidays. ($15 each, 3 for only $40!) Or write and ask for the free ESG catalog, detailing over 200 IMG disks and a new line of vector clip-art! And look for ESG at the Chicago Atarifest!

520STE Special

• built-in double sided drive • Blitter chip • stereo sound output • 4096 colors • 512K RAM • simm slots for memory upgrade • same 1040STE look

When you buy a 520STE at $369 we will install the other half meg RAM for only $10 while supply last. Or if you want more memory, how about 2 meg for $100 and 4 meg for $200 installed and tested.

Mega STE Special

• 8/16 mhz speed • built-in 50 meg hard drive • VME bus • stereo sound output • 4096 colors • Blitter chip • socketed for 68881 math-coprocessor • simm slots for memory upgrade • new and improved keyboard

Our new low price for a 2 meg Mega STE is $1,395 and $100 more for the 4 meg version.

Graphics Tablet

• use a pen to draw or move things • replace all mouse functions • much better control over the mouse • great for graphics applications • mouse and tablet work together

Our price including the tablet driver is $214

Phase-4 System

• Prism Paint Drawing Program • Chronos Key Frame Animator • Rosetta-3D Translator/Viewer • Prism Render • Prism Utilities • Prism Tablet Driver

Chronos-3D

Bill Rayl

In the heyday of CAD 3D and the Cyber series from Antic Software, animation was more a product of good programming than artistic talent. I personally never got involved with Cyber Control and CAD 3D because those packages didn't help the creative process— they got in the way of it.

After briefly looking at what the Cyber series had to offer, I gave up on my computer animation aspirations. Now, along comes Chronos-3D from Lexicor Software. I approached Chronos-3D with a hope that it would live up to its advertised claims. It does that and much more!

Before getting the package, I felt very much like someone who has recently been in a very bad car accident deciding to get behind the wheel once again. I was not expecting a very pleasant experience. I was wrong.

What is Chronos-3D?

Chronos-3D is a "Key Frame" animation package that allows you to create animations using CAD 3D objects (created by CyberSculpt, CyberTexture, etc.) or .3D4 files translated using Lexicor's Rosetta-3D.

Anyone who has seen documentaries on the animation work done by Disney,

Don Bluth and others, has seen Key Frame Animation in action. A master animator creates "key frames" that contain the start and end points of some action. Later, an animator's assistant creates the "inbetween" frames (or "tweens" for short).

Basically, Chronos-3D and your computer function as your professional animation studio. You are the master animator and you define the start and end points for movement of the objects in your animation. You decide the number of tween frames between each set of key frames—the more tweens, the slower the motion.

As your assistant, Chronos-3D automatically creates all the tween frames. No mess, no fuss, and no programming!

Look Ma, No Programming!

The ability to create complex animations with absolutely no programming knowledge is a very big plus for Chronos-3D. Using CAD 3D and the Cyber packages, animation was not for the faint of heart. If you didn't know the proper mathematical formula, you couldn't invoke the magic.

Chronos-3D frees your creative spirit and lets you do whatever your imagination desires. You create movement by dragging objects to desired positions with the mouse. You can rotate objects around X, Y or Z axis independently or around the X and Y axis at the same time.

You can stretch, squash and otherwise shrink or enlarge an object (or multiple objects). You can slant or tilt one or more objects. And you can do all these things with a couple mouse clicks and mouse movement.

The Main Screen

When you first boot up Chronos-3D, you are presented with the Chronos Main Screen, your little window onto the world of computer animation. A Tool Palette on the left side of the screen contains the move, rotate, scale and skew tools, as well as editing mode tools

This is a package that takes the Atari ST and TT to a new level of animation...

and quick view tools. The very excellent manual details how to use all these tools, so I won't go into them here in much detail.

To help you understand how the package works, though, try to think of Chronos-3D as a movie studio and you are making a film. This metaphor is held throughout the Chronos-3D package. In fact, the ending result of a successful animation is the creation of an .FLM (film) file.

The two standard viewing (or editing) modes in Chronos are Director mode or Camera mode. At any time during the animation process, you can jump from the director's chair to looking through the camera lens by a click of an icon. This allows you to watch as your "actors" (the CAD objects) pass in front of the camera while also allowing you to take a step back as the director to "get the whole picture."

Timelines

Each object in your animation has its own "timeline." This timeline consists of a series of frames in which the object appears. Modifying the timeline of one object does not necessarily modify timelines for other objects, although you can do global changes if you wish.

You can think of each timeline as a filmstrip containing only one object's motion. When Chronos-3D "records" your animation, it overlays these timelines on each other to produce the entire "film."

Keeping each object's motion independent of the object itself and the motion of other objects gives Chronos a lot of power and flexibility. This gives you full control of each object's timing and motion without changing any other aspect of your animation.

One useful benefit of this independence is the ability to create a complex animation sequence using a simple "stand-in" object. Once the sequence is ready for recording, you can replace the stand-in with a far more complex object. Using the simple object reduces the amount of time you spend creating the animation.

You can edit, cut and paste, insert or delete one or more frames in an object's timeline. When pasting, you have the option of including the original frames as is or pasting only the object's motion. Using Paste Motion, you can quickly create a sequence of motion with very little work.

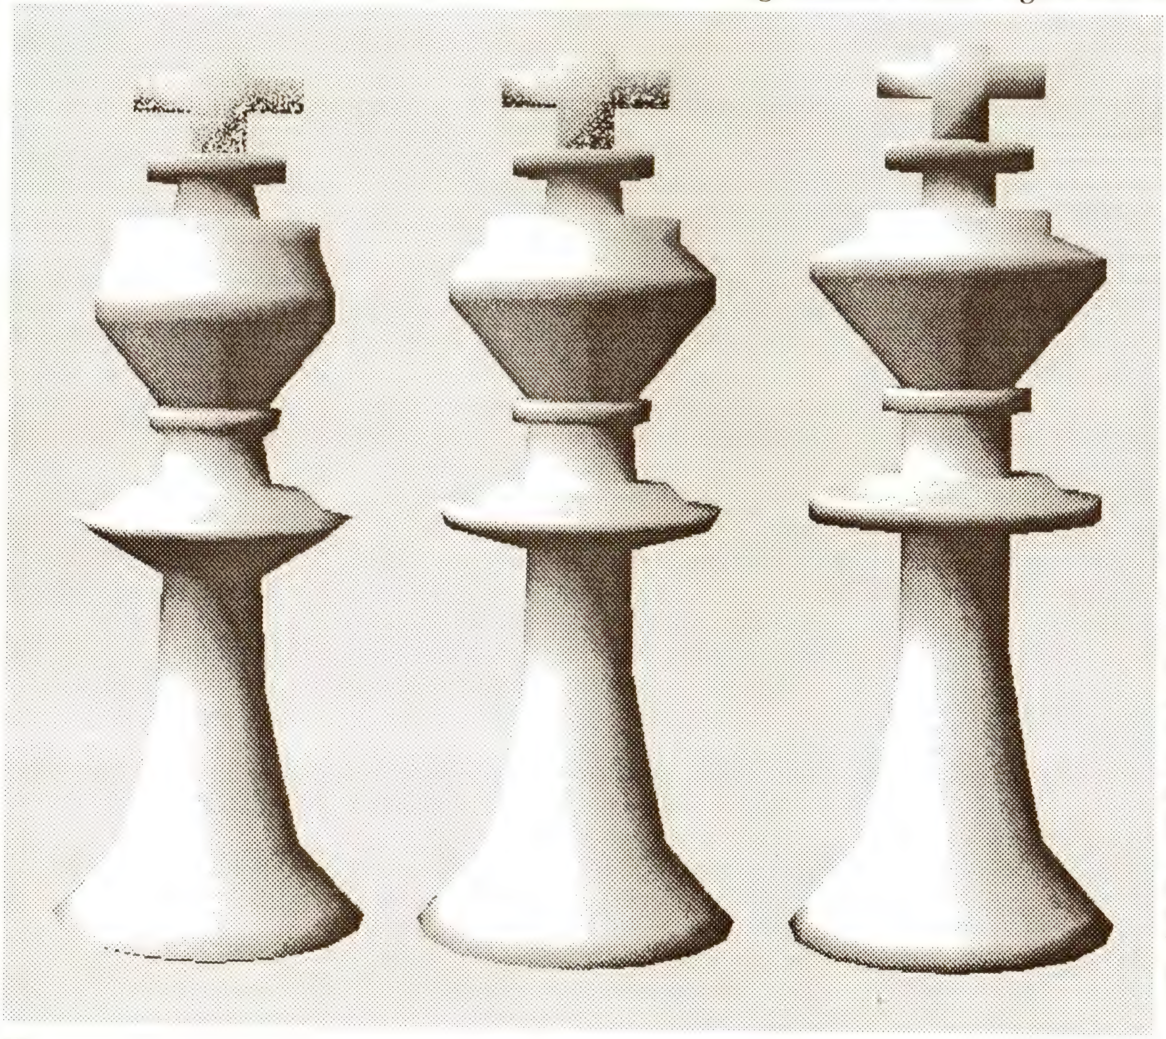
Cycling and Morphing

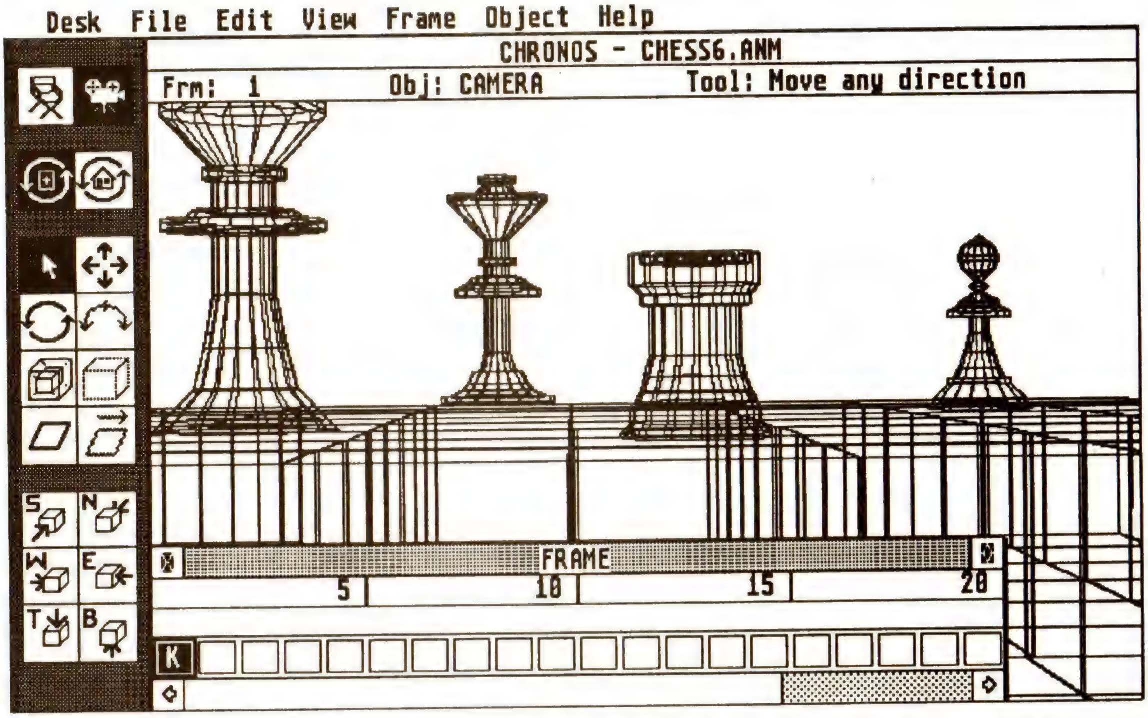
The ability to create cycles is one of the most powerful features of Chronos-3D. Using this feature, you can create very complicated motion almost automatically.

The third tutorial in the Chronos manual uses cycling to make a human figure walk across the screen. The figure is made up of 15 different versions of a man in various stages of walking.

In the Cycle dialog box, you load the objects you wish to use into the Cycle list in the order in which you want them to be used. Chronos will then cycle through these objects, one per frame, until the cycle is completed, and then start the cycle again until it runs out of frames in the timeline.

You can use any objects you wish in a cycle. The objects do not have to be





modified versions of the same object, as in the case of the walking tutorial.

As if this was not a powerful enough feature already, Chronos-3D can also add a Morph (short for metamorphosis) process to a cycle.

What this feature does is allow you to change one object into another before your eyes. In order for a morph to work, the two objects used must have the same number of points and faces.

To create a morph, you simply add the first object to the cycle list, click on Add Morph as many times as you want tween frames, then add the second object to the list.

As an example, I've taken two chess pieces and morphed the queen into the king in a total of nine frames to show how the process works. All I did was supply the two objects and Chronos-3D did all the work. The resultant morph cycle is shown in the three pictures on pages 16-19.

You cannot simply choose any two objects for a morph. You will need a program such as CyberSculpt to create objects that will work.

Tracking

One of my favorite features of Chronos-3D is its tracking abilities. You can automatically set the camera to track an object over selected frames, set a spotlight to track an object, and even have other objects track an object.

Setting the camera to automatically track a moving object is a very powerful tool that allows you to create sweeping action easily. You can, for instance, follow a human figure as it walks down a street or a spaceship as it dodges through a meteor storm. And all without ever touching the camera.

Lights...

Chronos-3D gives you a choice of five different types of lighting. Global Illumination supplies an even amount of fill lighting to the entire Chronos universe. Global Illumination is independent of any light source.

Point Source lights give lighting equivalent to an unshielded light bulb, emitting light in all directions with decreasing intensity the further you get from the source. Solar lighting imitates the outdoor lighting supplied by the sun.

Using Ambient lighting creates a diffused light source similar to Global Illumination, but with the ability to vary the intensity from frame to frame. The final light source is the Spot Light for creating focused beams of light similar to stage lighting.

The types of lighting in Chronos-3D are compatible with light source standards from the popular RenderMan package from Pixar.

Camera...

The camera in Chronos-3D is basically treated just like any other CAD object. You can select it, rotate it and move it from the Director mode. The camera has its own timeline, so you can have different camera angles and settings for different frames of your animation. Chronos-3D will even create tween frames for camera movement.

Once you have set your camera on a given spot, you can save the current camera position and view by setting a Tripod. Up to eight different Tripods can be set, and you can automatically move the camera from one to another.

Both the Camera and Director views can be modified in the View Window. This window gives you access to a number of settings, including Perspective, Zoom, Horizontal and Vertical rotation and Bank. Changing the Bank setting, for instance, lets you add a Hitchcockean flavor to your animation by tilting the camera angle.

Rotations

Using the Rotate About Home setting in conjunction with the Set Home command lets you move the

body09

camera around a defined center point. The default is the center of the Chronos universe. You can, for example, define this point as the place upon which an object appears. Then, you can use the camera to film while moving around this object.

The Rotate About Self setting in the View Window keeps the camera (or director) locked into the current spot, allowing the view to pivot around that position.

Using the About Home icon in the Tool Palette, you can make all objects rotate about a selected point—planets, for instance. I find it personally satisfying to create a universe in which the Earth is the center and everything else rotates around it. Take that, Copernicus!

The About Center icon can be used to rotate an object around their own center point. So, now you can make the Earth rotate around its center while the universe rotates around the Earth. Both the About Home and About Center icons are used in conjuction with the Motion tools in the Tool Palette.

Fading Away

Another neat feature is the ability to set Visibility for an object or a group of objects. Using this capability, you can easily make objects fade from view, appear and disappear instantly or create Star Trek-like transporter effects ("Beam me up, Scotty!").

This Visibility feature is simply great for creating images of an object in water, a reflection in a mirror or a view of an object as seen through a fog or cloud. Using Visibility in conjuction with a Morph can give you some pretty spectacular effects. The possibilities are almost endless.

Object Appearance

You also have a good deal of control over how the objects in your animation will be shaded, dithered, etc. The Object Appearance dialog allows you to select one of three shading methods—Flat, Gouraud and Phong.

Flat shading is, by far, the fastest shading method, but it is also the least impressive or realistic in its results. Each face of the object is shaded individually. Gouraud shading is far more impressive, as it takes into account the light sources being used and the end points of each face to determine how to shade each face.

Phong shading does a pixel-by-pixel shading of the object and is particularly useful when dealing with curved or rounded objects under a spot or point light source. Phong shading does take considerably more time to render, especially with complex objects, but the results are quite impressive.

A Smooth Faces option is also available when using either Gouraud or Phong shading. Turning Smooth Faces on causes a perfect blending of all faces, particularly useful for spheres and other rounded objects.

Finally, you can set Fixed or Random dithering, or no dithering at all. Choosing None tells Chronos to use only solid colors when rendering. Fixed dithering sets the same dither pattern to be used for a selected object throughout the entire animation and is most useful for stationary objects. When dealing with objects in motion, Random dithering is the preferred method. This tells Chronos to recalculate a new dithering pattern for each frame.

Rendering

When you've finally completed the design of your animation and it's time to record the "film," Chronos-3D offers a multitude of rendering options. Chronos currently supports all ST and TT resolutions and the ISAC board designed by Jay Craswell in 1024x768 or 800x600 resolutions with 16 colors.

You can render as a Wire Frame animation with rendering of all edges or only those edges that are visible. Solid rendering lets you select Faces or Faces & Edges. Using Faces, the individual parts of the object are blended smoothly together, while Faces & Edges retains the indivuality of the parts and gives a more angular appearance to the objects.

At the time of rendering, you can also choose from a number of overall shading options and whether to use an actual color palette or gray scale mode (or no palette). You can record the animation from the camera's point of view in each frame or from the currently selected view in the main screen. You also have the option of rendering your creation in Draft or Final mode, as well as saving the resultant file in .FLM format or Antic's .DLT format.

At the bottom right of the Record dialog, you have a number of options and check boxes from which you can select. These options allow you to include the lights, camera and grid in the recorded animation (normally, they disappear in the final product). You can also toggle between a white or black background for your animation.

At the very top of the dialog box, you can choose which frames appear in your animation. For instance, you can decide to record only frames 10 to 80 of a 100 frame animation *and* only record every other frame or every third frame, etc.

Manual

With any powerful software package, you need a very thorough and well organized manual. With Chronos-3D, you get it! The 11 chapters of the manual take you step-by-step through the entire program, with detailed tutorials and reference sections you'll turn to again and again.

The eight page Table of Contents and 11 page Index have never failed me yet. Whenever I needed to find some piece of information, the Index pointed the way and the manual contained exactly what I was looking for.

If you're a new user to the ST, the manual has sections detailing how to use your computer, the mouse, etc. If you're new to animation, there is some fairly good discussion of key frame animation principals in the first chapter. Chapter 10, "Putting It All Together," has a number of useful tips on speeding up the design of your animation, using CAD objects, creating motion and lots more.

For the new animator, there is even a Glossary of terms in the back of the manual with definitions of animation, computer and Chronos jargon.

The manual comes with a hard plastic 3-ring D binder that's built to take a lot of use. A serial protection dongle also comes with the package. That's right, Chronos-3D is copy protected. The dongle plugs into the serial port (you need a 9-pin to 25-pin adapter if using a TT or Mega/STE) and has a pass-through. You can then plug your modem into the dongle and forget about the whole thing. A parallel port version of the dongle is also available.

Conclusions

I've tried to touch on most of the major features that Chronos-3D has to offer. This is a package that takes the Atari ST and TT to a new level of animation capability while still allowing CAD 3D and Cyber series users to take a lot of their past work with them.

As part of an overall "Phase-4" package from Lexicor, Chronos-3D offers Atari users all the power and flexibility that owners of other computer brands are just now getting as well. Its ease of use and ability to create animations with no programming opens the world of computer animation to many people who otherwise couldn't be involved.

I wholeheartedly recommend this package to anyone who is interested in computer animation, from the professional animator to the novice animator who has never used a computer to create animations. At about 1/2 to 1/4 the cost of comparable animation packages on the IBM, Macintosh and Amiga, Chronos-3D puts the Atari back on the animation map.

MONITORS & FRIENDS

I'm A Monitor
What Are We?
Just Specs?
Just Doughnuts?
Or Passive??

☛ Everybody needs a monitor. Sometimes they even need two. When they do, **TOADSWITCH** and **TOADSWITCH-M** come to the rescue! Order your **TOADSWITCH** *toaday!*

Atari SM124 Monochrome	$159
Atari SC1435 14" Stereo Color	$329
Magnavox 1CM135 14" Stereo Color	$319
Acer 7015 ST/TT Color/Mono Multisync	$409
Mitsubishi DiamondScan 14" Multisync	$509
Atari TTM195 19" Monochrome	$959
TOADSWITCH ST Monitor Switcher	**$39**
TOADSWITCH-M ST Multisync Controller	**$59**

A Monitor Switchbox, a Multisync Controller AND Seismograph? WOW!

☛ The **TOADSWITCH** and **TOADSWITCH-M** are handy switches which will switch between monochrome and color on the ST. The **TOADSWITCH** is for two standard ST monitors. The **TOADSWITCH-M** is designed for switching between color and monochrome on a single multisync monitor, but will switch two ST monitors also.

New Catalog is OUT!

We recently finished our new catalog. It's thirty-six pages jam-packed with stuff you just gotta have — with explanations and articles about everything. If you are on our mailing list, you have probably received one. If you've not received one, please give us a call and we'll send you one pronto. Includes everything from accelerators to Z-RAMs. Call **toaday** and get yours!

We Buy Eight Bits!!!

The response to our recent campaign to resell used eight bit equipment has been impressive, and we've moved a lot of stuff. If you've got some eight bit stuff you'd like to sell, send us a list of what you have, and let us know whether you're looking for cash or credit in exchange for it. We'll get back to you with what we can do for you! It's that easy! Call for our catalog!

It STopped Breathing?

If your ST has just stopped breathing, give it two puffs followed by five chest compressions and then send it to us. Some days we just wait around for ST's to kick the bucket - just so we can go and fix 'em. Don't hate us because we're morbid, though. Send us your ST before real brain damage takes place. Include a note listing symptoms of death, and try to call us before you send it.

Pagestream 2.1! Now!

Pagestream, the standard for Postscript desktop publishing on the Atari has a new version - 2.1. They're not foolin' around - this time they have included support for Adobe Type 1 fonts, Compugraphic Intellifonts, and Pagestream standard fonts, too. Postscript fonts can be printed to non-Postscript printers, too! Order yours TOADAY! Only $179.95 introductory offer!

C or Assembly—
Is There a Choice?

I don't always mean what I say. Or is it that I don't always say what I mean? Anyhow, in response to the question "C or assembly—which should I use?" I most often snap back "Assembly!" Actually, that's not what I mean.

Robert C. Arp, Jr.

What I Really Mean Is...

Until recently, the most definitive reference books used Pascal to illustrate algorithmic implementation. Inasmuch as Pascal was designed specifically for that purpose, there could not be much opposition to the practice.

After C became the language of choice for both programmers and students—and since C has all of the advantages of Pascal but none of the disadvantages—the most acceptable references were rewritten using C as the implementation language.

There are still many acceptable references which use Pascal as the illustrative language; however, since most acceptable references are currently using C, it seems reasonable to assert that learning C is now a prerequisite to learning to program.

Therefore, focusing attention of the topic on those who are involved in the serious (as contrasted to recreational) study of programming, I say, "There is a choice. But the choice is not whether to C or to assembly."

What I really mean is that assembly is the language of preference after one has acquired a solid background in C. The only choice is which to study first. Of course, I don't imply that it is possible to ever *actually conclude* the study of either language.

C Is Important Because...

Algorithmic design and implementation are discussed using higher level language examples because, if the sophistication of the language exceeds the sophistication of the algorithm, the complexity of the discussion is reduced.

For example, only the most comprehensive assembly language books discuss data structures; and even when they do so, implementation via Pascal or C usually precedes any implementation in assembly.

That's one of the reasons C is such a popular language. The sophistication of the language reduces the discussion of complex algorithmic design and implementation to trivia in many cases. In other cases, it at least reduces complexity to tractability.

One of the more powerful features of Atari computers is the graphic mouse/keyboard user interface. Programs designed to utilize that interface rely heavily on the use of complex structures. C facilitates the design of those programs because C reduces the complexity of the structures.

Unfortunately, C often extracts a heavy price in exchange for its sophistication. That price is paid in performance during program execution.

Assembly Is Important Because...

What C taketh, assembly returneth—and then some. In a way, assembly is much more efficient on Atari computers than it should be. If the designers of the operating system had written the OS in assembly, execution performance would be at least tolerable for programs written in C. Assembly could then be reserved for those programs requiring spectacular execution speed.

But because they did not, assembly language programs are required to recover much of the power squandered by those designers. Fortunately, 68000 assembly is sophisticated enough that conversion of C-designed complex data structures to assembly does not require excessive effort.

For Example...

In Chapter 4 of his COMPUTE! Atari ST AES book, Sheldon Leemon discusses GEM graphics objects. In the first sentence of that chapter, he asserts that the concept of GEM graphics objects is the key to the GEM interface. Here, the object is simply a label applied to a declared structure.

Leemon closes his first paragraph in that chapter with an assertion that GEM objects are the basic building blocks for all of the sophisticated GEM visual constructs, such as dialog boxes and menus. He then presents the structure which I repeat below for illustrative purposes in this article.

```
typedef struct object
{
        int   ob_next;   /* object # of next "sibling" */
        int   ob_head;   /* object # of first "child" */
        int   ob_tail;   /* object # of last "child" */
        unsigned int   ob_type;   /* object type: BOX, CHAR,... */
        unsigned int   ob_flags;   /* flags for color, fill pattern...*/
        unsigned int  ob_state;  /* flags for how to draw - SELECTED,
                           CROSSED, etc. */
        char   *ob_spec;   /* pointer to object-specific info */
        int   ob_x;   /* left edge of object */
        int   ob_y;   /* top edge of object */
        int   ob_width;   /* object width */
        int   ob_height;   /* object height */
} OBJECT;
```

Leemon then discusses the concept of a binary tree structure and each member of the above structure in detail. As part of his discussion, he uses an example GEM dialog box to illustrate the role of the first three members of the structure. Leemon presents a tree walking algorithm using the structure of the dialog box to illustrate algorithmic design. Herein, I will present an assembly language implementation of that tree walking algorithm.

If you do not have a copy of Leemon's AES book, I suggest you obtain one as soon as possible. For sure, the book will facilitate your understanding of the algorithm I am to present. Beyond that, however, Leemon's books are essential references for any Atari computer programmer.

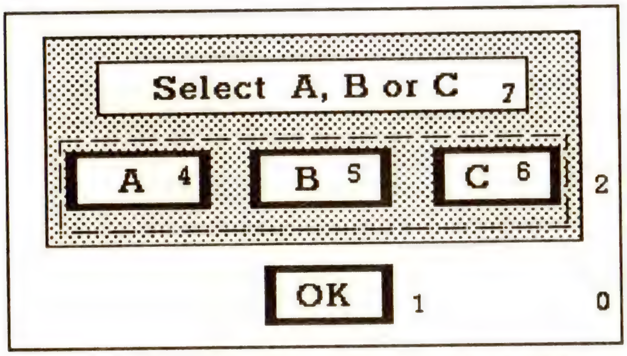

Figure 1–Sample Dialog Box with Eight Objects
(Object 3 is invisible in the actual dialog box and is indicated here by the dotted line rectangle)

The Dialog Box

My example dialog box is shown in Figure 1. This box is very similar to that used by Leemon. I forced the object number of each component to match that of Leemon's, even though I would not normally design the box that way. The box with the dotted outline is object #3, the invisible box—that is, pretend you don't see the dotted lines. Other than the invisible box, the number of each object is shown within the object or directly adjacent to the object's right edge.

The GEM interface has been designed to encourage programmers to maintain GEM object data files—.RSC files, or resources—apart from executable files. Many programmers and users, however, find the two-file arrangement to be cumbersome. Therefore, the current trend is to include all object data within the executable program.

Several programs have appeared in the public domain which convert the output of resource construction sets to language specific data files that can easily be included within a program's source file. I have converted the resource construction set's output for the dialog box shown in figure 1 to the data file shown below.

```

rscend:
```

The configuration of the object data file can be directly compared to that of the C struct declaration to verify that the declared members of each assembly object matches those of the C object structure. There are eight object structures in the assembly language file. Note that these eight structures form an array of structures and that each element in the array can be referenced from the labels tree0 and obj0_0. The element offset is 24 bytes.

Figure 2 is a pictorial diagram of the information contained in the first three members of each of the objects in the resource data file. Each object is identified in the pictorial by its object number. Arrows indicate the linkage between object structures. Leemon uses a double arrow structure to indicate two- way linkage between objects; I use separate arrows to indicate the same type of linkage.

Identifying the box containing the object number as an internal node and the smaller boxes containing the linkage information as links, I can use terminology commonly found in references to compare the tree shown in Figure 1 to a binary tree, which has two links below each internal node. Because GEM object trees have three links, the term binary seems not to apply.

Correlating the GEM links to those found in references for binary trees, we can match the Next link to that called a sibling (a right link in some references) and the Head link to that called a child (a left link in some references). The third link, Tail, has no correlation in any reference text I have seen, although the existence of such is implied in Robert Sedgewick's second edition of Algorithms.

There, Sedgewick indicates that a third link would provide a way to move up a tree, thereby overcoming the down only limitation imposed by the two-link binary tree representation. Note that he tends to apply the label binary to all trees, regardless of link quantity.

Indeed, as shall be seen shortly, that third link does permit movement up the tree. For further detail concerning the pictorial, I refer you to Leemon's book. Furthermore, I refer you there for his algorithmic procedure, listed as a series of steps one through four.

If you compare his procedure to my assembly language implementation of the tree walk algorithm, you will note several differences. For example, in his first step, Leemon proposes an "inorder" traversal of the tree. My implementation is that of a "preorder" traversal. In addition, my implementation presupposes the existence of one or more trees in the resource data file.

To illustrate the assembly language algorithm, I select as its raison d'être the conversion of each object's location and size fields from the character-based coordinate system used in resource files to the absolute pixel system required by the executable program. This is one of the first tasks that must be accomplished when including a resource data file in the executable file.

The Assembly Language Implementation

The tree walk algorithm is prepared in the form of a subroutine which would be called early within a program, certainly before any activity requiring that any of the GEM object trees be drawn. Within the program's data section, situated before the resource file declarations, an array of pointers to all object trees would be declared. This array would be null terminated and would appear as that shown below.

```
tree_pointer_array:
        dc.l tree0,tree1,...,treen,0
```

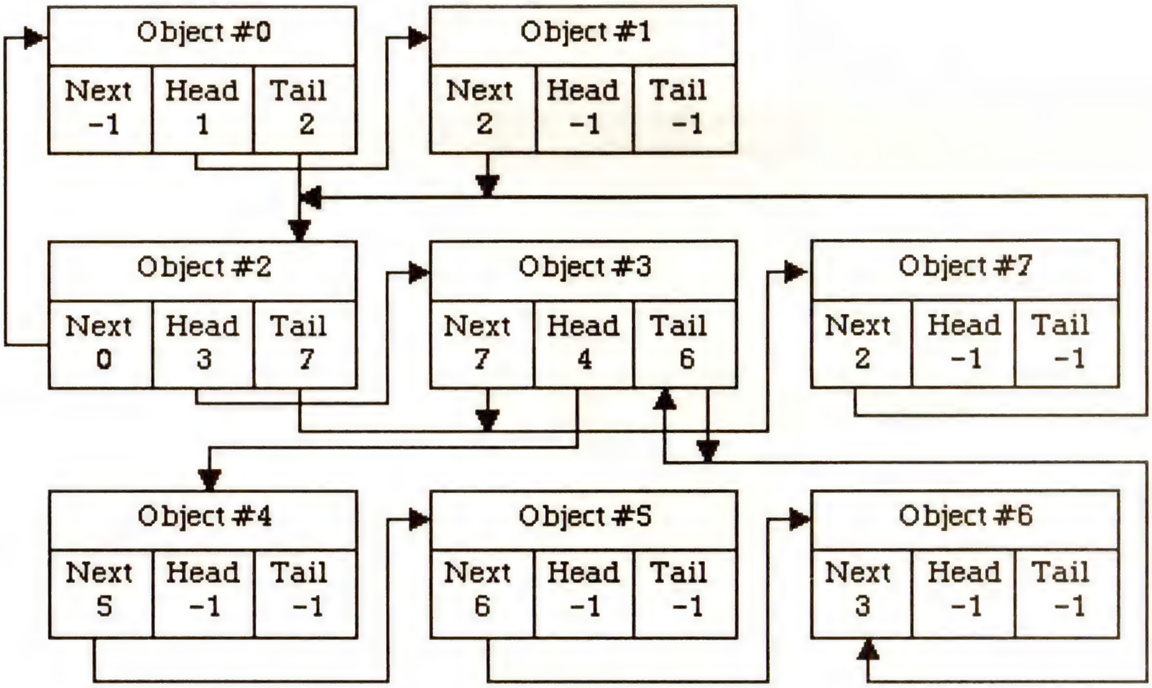

Figure 2–Object Linkage for the Tree Shown in Figure 1

```
change_tree_coordinates:
 ; Point to the GUI's object tree pointer array and step through it to
 ; fetch each tree's address. Walk each tree and change each object's
 ; character coordinates to pixel coordinates.

 ; Algorithm History:
 ;     Resource construction programs construct objects so that they are
 ; aligned according to character positions. GUI programs require objects
 ; that are aligned according to pixel coordinates. The rsrc_obfix aes
 ; function converts the character positions to pixel coordinates.

 ;     The tree walking algorithm was developed using the example on page
 ; 100 of COMPUTE!'s AES book (by Sheldon Leemon).

 ;     The algorithm was designed and tested in the program TREEWALK.

 move.l     #rsrc_obfix, aes_pb        ; COMPUTE's AES page 303.
 lea        tree_pointer_array, a3
 moveq      #-1, d5                    ; Tree number up counter.
walk_tree_outer_loop:
 move.l     (a3)+, a4                  ; Fetch address of tree.
 move.l     a4, a5                     ; Need another copy.
 move.l     a4, addr_in                ; Address of tree being processed.
 addq.l     #1, d5                     ; Increment tree counter.
 moveq      #0, d7                     ; Object number register.

walk_tree:
 ;      The process being performed for each object is the conversion of
 ; its coordinate parameters from character based to pixel based.

 ; Current object number is in D7. Current object address is in A5.

 move.w     d7, int_in                 ; Visit the node.

  lea        0(a4,d4.l), a5     ; Fetch address of new current object.
  move.w     4(a5), d4          ; Fetch ob_tail of new current object.

  ; Compare the object number in D3, which is the object number of the
  ; previous object, to the number in D4, which is the ob_tail field of the
  ; new current object.

  ; If D3 = D4, then new object is the parent of the previous object.
  ; If D3 not = D4, then new object is a sibling to the previous object.
  ; In either case, the object in D7 has become the new current object.
  ; Only the branch back point depends on the comparison.

  cmp.w      d3, d4
  beq.s      examine_ob_next       ; Object is parent of previous.
  bra        walk_tree             ; Object is sibling of previous.

 exit_inner_loop:
  ; When A3 is pointing to zero, all trees have been processed. That's
  ; true because I have stored a zero as the last pointer in the array of
  ; tree pointers.

  tst.l      (a3)
  bne        walk_tree_outer_loop
  rts
```

Other Declarations

The success of the tree walk algorithm depends on the presence of several other declarations. I am inclined to assume that anyone who understands the algorithm understands where and how to place those declarations. However, in case one or two readers may be momentarily disorientated, I'll list those below.

```
  ;
  ; AES AND VDI STRUCTURES AND ARRAYS
  ;
 aes_pb:             dc.l  control,global,int_in,int_out,addr_in,addr_out
 vdi_pb:             dc.l  control,int_in,pts_in,int_out,pts_out

  ; PREDEFINED 'CONTROL' STRUCTURES
 rsrc_obfix:
  dc.w 114
  dc.w   1
  dc.w   1
  dc.w   1
  dc.w   0
```

Conclusion

We can feel righteous dismay because the operating system used in Atari computers was written in C instead of assembly. If the system had been written in assembly, C would probably be the appropriate language for most applications. Instead, only programs written in assembly have a chance of recovering execution speed squandered within the operating system design.

Fortunately, the assembly language used in Atari computers is sophisticated enough to facilitate the translation of complex data structures from higher level languages to assembly. Using assembly language and bypassing the operating system whenever it is convenient to do so, we gain more than was lost.

A solid background in C is a prerequisite to the study of the complex data structures that are the foundation of the GEM interface. But with experience in assembly language algorithm implementation, we can eventually eliminate the intermediate translation stage of program development. As an example, I have presented this assembly language implementation of Leemon's tree walk algorithm.

With multi windowing capabilities, HyperLINK fullfils the "Cluttered Desktop" metaphor!

* Hypertext Environment
* Multi-Media Support
* Networking Support
* Customizable Linking
* Custom Application Builder
* Multiple HyperLINK Applications can be run at once!
* Text / Graphics / Sound / Speech / Animation Modules all included
* DBase Compatible File Structure
* Includes ICON Library
* Customizable Report Generator
* Supports Moniterm Monitors
* Custom Windowing (Allowing 7 Active Windows)

SYSTEM REQUIREMENTS :

* ST/STE/MEGA STE/TT
* Requires 1 Meg RAM
* Color or Mono Monitor
* Hard Drive Recommended
* Comes on 2 DS Diskettes

Thanks...
In this past year Rising Star has grown to become one of the largest Atari dealers in the U.S.! We now staff qualified technicians that can repair a dead ST or put new life into an older ST with an upgrade! All of this would not have happened without you, the Atari user. From one star to another, Happy Holidays and thanks for a great year!
Douglas Hodson, Owner

If you don't see it, call we carry over 2000 titles!

Trade Up!

If you own a 520 or 1040ST consider trading up to an STE! They're really fast and fun. Call us or better yet call me, Doug, and let me tempt ya!

FAX an Order!

Now you can FAX us an order 24 hours a day. FAX # 1-513-254-7970!

Coffee Mug?

Place any order with us over $400 and you'll get a "I'm a Rising Star" coffee mug FREE! They're really cool and if you must have one but can't afford a $400 order, it's only $9.50!

Acceleratorsǃ

WAACE '91 Show Report

(and a little more!)

Patricia Snyder-Rayl

Below: The amazing features of CodeHead's Avant Vector

I have to apologize up front because I'm not able to go into a lot of detail about the various products shown at the recent WAACE show. I was stuck at our own booth selling stuff like hotcakes most of the time, so I wasn't able to get a good look around at what other vendors were selling. That's good news for AIM, but bad news for our readers! I do have a lot of quotes from vendors to share about the show, however.

The show was a rousing success, following shortly on the heels of the successful Glendale show a month earlier in California. The total count for both days rested at about 2,300 people through the door.

Unusual for the WAACE show, though, many of these people came from very long distances away. I saw people from Florida, North Carolina, Michigan, New York and other states I can't think of now. Even with the number of people through the door being a little bit more than attended WAACE last year, the people who came were definately buying more product than at last shows!

A Little History

The WAACE show is an annual event held in the Washington DC area, sponsored by a collection of Virginia and Maryland clubs under the umbrella organization WAACE (Washington Area Atari Computer Enthusiasts). The show started out as a free public event in Fairfax High School designed to educate people about computers in general and Atari computers specifically. The event grew so large in popularity and size that the high school and WAACE show committee agreed to move the show to a more commercial setting—the Reston Sheraton to be precise.

Three Companies and a Booth

The last time we attended WAACE's show was two years ago—the last year it was held in the high school. We heard great reports about last year's show, but weren't able to go ourselves. This year, we were able to attend through a combination of early registration discounts and judicious booth sharing.

We actually had three different companies sharing our AIM booth! We had Unicorn Publications, of course, but we also represented CompuServe's Atari Forums for Ron Luks and Branch Always Software for Darek Mihocka.

Handing out CompuServe signup kits was no problem, and I was used to selling magazines and Disks of the Month, but I was totally unprepared for the deluge of people wanting to upgrade from Quick ST II to Quick ST 3! It really makes you want to sell software packages when you see all these show-goers eager to throw their hard-earned money at you. Darek did very well at the show, selling out of all the copies of Quick ST 3 he gave us. We did very well too, signing up more subscribers than at any past show and selling more magazines and disks too!

Atari Explorer's John Jainschigg and Maura Fitzgerald

Ours weren't the only happy faces! Joppa Computers, an Atari dealer and mail-order firm with a large display at the show, sold out of all the 24 STEs they brought! Here's what some of the vendors had to say:

Vendors Speak

Nathan Potechin of ISD Marketing, Inc in a report on Saturday, "The show is going real well. Attendence is great, enthusiasm is high. ISD has its first booth ever. Mario, Shawn and Julius are strutting their stuph :-) while I kibitz. :-) In fact, here I am typing away in GEnie's booth. Darlah had disks made containing the latest ST Aladdin, ARC and LZH Utilities, GEnie Lamp, etc. She has been making them available to all comers for $1 and they are going real fast. :-) No surprise." *[Ed: Unfortunatly, the GEnie disks were infected with the Key virus. Be sure to use VKiller on the disk if you picked one up at the WAACE show.]*

"While indeed Sunday was markedly slower than Saturday, we nevertheless enjoyed the show very much," said Atari's Bob Brodie. "This type of slower pace allows for more quality time to be shared with the attendees. And the Sheraton has a number of very nice areas where one can sit and enjoy a quiet conversation...without the whole world watching!

"Not having a booth, or a speaking slot on Sunday, I opted for a more casual approach to the show and went in wearing jeans (yes, blue ones!) and my GEnie T-Shirt. I managed to escape notice *a little* bit more, but lots of people still came up to say hi. I also got a chance to do some honest shopping...picked up a cartoon disk from the Wiz Works guys, an update to Tracker 3.0, and got some extensive demos on exciting products. Then it was off to the productivity room for a demo of 3D sculptured surface modeling with ChromaCad—running on a 130XE. *Very* impressive!"

Want to get the most from your Atari investment?

Subscribe to *Atari Explorer*, the Official Atari Journal! Each issue of *Atari Explorer* is filled with reviews, tutorials, hints, and late-breaking news to help you keep pace with the fast-changing world of Atari products! And *Explorer* is the only Atari magazine that covers the full range of Atari equipment — from the exciting ST and TT computers, to the 8-bit home computers, to the amazing Portfolio palmtop MS/DOS computer and the Lynx Portable Entertainment System — so whatever Atari you own, you'll always find something new, relevant, and exciting in our pages!

Six issues of *Atari Explorer* are only $14.95 — a savings of 15% off newsstand price! That's a small investment that pays BIG dividends, when it comes to getting the most from your Atari! So what are you waiting for? Subscribe today, and plug into the most useful Atari peripheral money can buy: *Atari Explorer Magazine*!

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, Texas, from 6:30 to 9:30 PM. General meetings feature a presentation of general interest and small group problem solving. Each third meeting we have a swap meet, a computer workshop, and a mini-briefing on a topic of current interest in lieu of the longer informal presentation. AAAUA also maintains a Public Domain Library of about 700 disk titles as well as a sizable hard copy library of magazines and newsletters. Each month we publish (FR)ANTIC, our user group newsletter, covering happenings of local interest as well as other topics, both technical and non-technical. Regular members also receive a subscription to AIM Magazine as part of their member benefits. Subscribing members may choose AIM as an option. Dues for Regular family membership are $24 per year or $15 for six months. Dues for Subscribing membership are as follows:

Domestic (within the U.S.) $16
(FR)ANTIC and AIM

Foreign (Mexico & Canada)
(FR)ANTIC only $14
(FR)ANTIC and AIM $36

Foreign (Other)
(FR)ANTIC only $18
(FR)ANTIC and AIM $54

For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

PRESIDENTIAL PONDERINGS

In these times of high costs, no one likes to hear of price increases. Unfortunately, that is what I now must address. A recent review of our costs to produce and mail our monthly (FR)ANTIC newsletter and pay the additional postage for foreign mailing of the Atari Interface Magazine (AIM) revealed the necessity to raise our dues for Subscribing members. We regret this, but, while we are a "not for profit" organization, we cannot afford to pay out more than we receive and long remain a viable user group. Current Subscriber memberships will not be affected until the date of renewal. We trust current and prospective Subscribing members will understand our difficult decision.

Because of the significant increases in dues including AIM for our foreign Subscribing members, we are offering these members the option of subscribing without AIM. Domestic subscribers have only one category of membership; i.e. including AIM. Please note that delivery of AIM is contingent upon Unicorn Publication's production schedule and a significant change (increase or decrease) in our mailing costs could result in an adjustment to Subscriber dues in the future.

Once again, I am sorry that these new rates are necessary. Foreign subscribers should examine other options that they may have to get AIM. Our feelings will not be hurt. Our offer is a service to Atarians throughout the world; if you know of a better way, by all means choose that way.

The GOOD NEWS is that we have AIM and their public domain disks. For this we can be thankful. Each of us should remember to thank Pattie and Bill Rayl whenever we get the chance. Until next month, enjoy your fabulous computer and think Atari.

ACCT

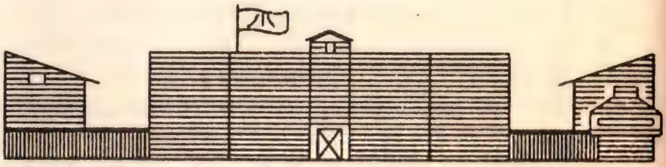
Atari Computer Club of Toledo members receive, as part of their dues, Atari Interface magazine and access to the 8bit and ST public domain software libraries. Disks are $2/8bit and $4/ST. Non-members may purchase disks at a slightly higher rate.

ACCT serves Atari users in the greater Toledo area and the sole purpose of the club and its resources is to promote the continued use and in-depth understanding of the Atari family of computers in the home and office environments.

ACCT meets on the first Wednesday of each month, from 7-9 PM at the home of Dave and Brenda Micka. ST and 8bit SIGS are held immediatly following the business portion of the meetings.

ACCT may be contacted at 4487-289th Street, Toledo, Ohio 43611 or by phoning Dave Micka at (419) 729-1891 or Michael Justice at (419) 242-7797.

President David Micka (419) 729-1891
VP Michael Justice (419) 242-7797
Secretary Sharon Hill
Treasurer Rose Taylor
ST Librarian Brenda Micka



ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN is the Fort Wayne, Indiana Atari users group and supports the full line of Atari computers. We meet on the first Saturday of each month from 10 AM to 1 PM at the Shawnee Branch of the Allen County Public Library. For more information call our BBS at (219)744-1396 (9600 baud) or contact Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

Notes from the October Meeting:

The October meeting was our joint meeting with the local IEEE chapter and was held in the Magnavox Board Room in Industrial Park. Attendance was quite good and after a few opening remarks from Kevin Van Zuilen (IEEE) and Eric Converse (ACORN), attendees were given the opportunity to observe the numerous demonstrations being conducted around the room. The demonstrations included: MIDI Music by Erin Kelley, ST Telecommunications and the BBS by Kim Stahn, Games (Lemmings) by Adam Kelley, 8-bit Telecommunications by Scott Schaffer, Emulators by Karl Fadus, Computer Languages by Ken Liechty and Bob Kelley, and Desktop Publishing by Ken Helms. A big THANK YOU to all those that brought equipment and conducted demonstrations. A thanks also goes to the IEEE for the pizza afterwards. A good time was had by all.

Plans for Future Meetings:

November 16 and 17 is the date for Pentacon, the Northeast Indiana Gamers Association's annual convention. Note that it is two days this year and ACORN has been given a large area at the Grand Wayne Center to show our stuff.

Several members are planning on attending the big Atari computerfest in Chicago November 23 and 24 also.

ASTMUM

ATARI ST/MEGA USERS (Montreal)

Our users' group consists of MIDI musicians, composers, videographers, artists, writers, technicians, students, teachers and business people. We also welcome new members, interested in learning about the ST/MEGA models and their applications, before purchasing.

Founded in 1987, ASTMUM provides its productivity-minded members with technical support, training and emergency assistance (24-Hour, Repair Hotline), laser printing and graphics services, as well as discounts (through participating dealers) on original software, computer hardware and music industry-related equipment.

To benefit its members, and the visiting public, our group has participated in these shows and expositions:

Windsor/Detroit International AtariFest, May '91
PRODUCTION '91, Montreal, June '91
SIIM '91, Montreal, June '91
WAACE AtariFest '91, Reston, VA USA, October '91
Chicago AtariFest, Rosemont, IL USA, November '91

We have kept our members informed of Atari's progress on their most recent models (TT, MEGA STE, ST Book and STylus) through our large periodicals library, videotaped show-tours and interviews with software and hardware developers. Encouraging members to form special interest groups, we hold monthly meetings (usually the last Sunday of each month) and offer seminars and demonstrations.

Some members offer Audio Recording and Music Technology courses, in "hands-on" studio environments, at generous discounts to other members. We have members who are masters of piano tuning and instrument restoration. Incoming members are impressed by the efficacy with which our specialists troubleshoot the previously unsolvable. Even singers find help for their vocal problems!

In addition to helping ASTMUM musicians market their CDs, LPs and cassettes, at exhibitions and retail outlets, we are assembling a "sampler" cassette highlighting some of their work.

If you use your Atari to create music or assist in performing it, and would like help in launching an independent release, our group may be just the ticket.

Membership information, advice, and sampler cassette price and availability may be obtained by writing to:

ASTMUM, P.O. Box 966, Station B Montreal, PQ, Canada H3B 3K5 or by phoning (514) 272-6631 (voice only)

Executive Exhortations by Kest Carter-Morgan:

I'm impressed that AIM's compendium of users' groups is expanding. I was also pleased that Bill and Pattie Rayl handled things for Darek Mihocka (Branch Always Software) during his absence at the WAACE AtariFest. I'm not surprised that he did not come; he was visibly irritated by unmindful and inconsiderate announcements, repeatedly blaring and reverberating into the seminar room, interrupting his presentation at the Windsor show in May. I know this, because I was there, videotaping the proceedings. When it happened to David Small, he tried to make a joke of it, but I could tell it bothered him too. This happened again at the WAACE show! It can certainly tend to discourage presenters from coming back.

A feature of the WAACE show was the use of separate meeting rooms for "hot" topics (e.g. Gaming, Education, DTP and MIDI), where volunteers gave presentations and training to interested visitors. In rotation with other MIDI presenters, our own Christopher Smith gave his "MIDI On A Budget" presentation, featuring the Cosh sequencer program and its upgrade path. This was also disrupted by loud, distorted announcements from overhead speakers. Eventually, a way was found to shut them off—once the damage was done.

If people are expected to prepare presentations and travel, from afar, at their own expense, to deliver them, the show organizers should, at least, prevent the intrusion of such announcements in seminar rooms and presentation areas, except in real emergencies.

Certain show organizers might argue that P.A. announcements are their best way of notifying attendees of events and prizes. In practice, such announcements are intrusive, often unintelligible, and won't be heard by attendees in their hotel rooms, restaurants and other blanked-out areas. Surely, at high-tech computer shows, we're capable of more effective communication methods without infringing on areas requiring control.

Perhaps because we were on a college campus in Ontario, smoking was better controlled at Windsor than at WAACE, where it went on unbridled. If the Shereton Reston had rules against smoking in enclosed public spaces, they weren't enforced. For our part, we discourage die-hard smokers from joining our group if they can't make it through meetings without smoking, because there are no provisions for smoking anywhere on our premises, except outdoors.

The above criticisms were offered in hope of smoother operations at future festivals.

In addition to MIDI room participation, we had booth #44 at the WAACE AtariFest '91. Featured at our booth were: the Sylvain Gagnon Quartet's CD, "Crépuscule", Ron Smail's Vocal Arrangements and Paul Etch, in person, demonstrating his Techno-Pop releases. While I dashed around, videotaping seminars and such, Garry Stocker, the fourth member of our party, assisted Paul at the booth.

As in Windsor, we also showed the Yamaha QY10 (a 32-voice, velocity sensitive, multi-timbral sound module, drum and percussion module, 8-track music and rhythm sequencer), which has its own, tiny keyboard for entering musical ideas on the fly. People were surprised to see that something making such exceptional sounds was no larger than a videocassette! With Midi In and Out, it can communicate with your ST and larger components. Since the QY10's memory is limited to 6,000 notes, you're best to examine one, carefully, to determine what it can and can't do, before buying it. A powerful package might include this unit and a MIDI data recorder or the ST Book, when available.

We brought along our Casio Midi Guitar and hooked it to the QY10 and our Kawai MS710. Garry and Paul alternated in playing it. Atari Explorer's John Jainschigg, at the neighbouring booth, even tried it out and conversed with us in French! A pleasant sidelight to our visit was finding a number of truly musical people among Atari Explorer's staff. This guitar reinforced the point that Midi is not the exclusive domain of keyboardists.

By the time you read this, we'll probably be demonstrating our MIDI skills and some new equipment at the Chicago ComputerFest, jointly held by LCACE and Atari, November 23 and 24, '91. We may also distribute, from our booth, a schedule of events for Montreal's 350th birthday celebration in 1992. Hey! Why don't we find a slot in there for an AtariFest as well? At the very least, Atari Canada could stop missing opportunities for involvment in certain shows that roll 'round every year. We'd like to hear your thoughts on this.

It is thrilling to meet other Atari MIDI enthusiasts, in person, at these shows and share mutual concerns. For some time, we've been gathering the names of individuals interested in forming local, Atari ST-based MIDI users' groups, internationally linked to larger, more established, MIDI groups like ours. If this interests you, please come and sign-in at the show, or write us at our aforementioned address.

We still remember and thank Brian Cassidy and family, of WAUG, for inviting us to the Windsor show. It took a lot of fortitude for the organizers and participants to keep the Atari lamp glowing while surrounded by recession!

I'd like to thank the organizers of both the WACCE and LCACE shows for their efforts to accomodate our special needs (e.g., equipment loans, and booth locations where our audio would not be directed toward facing booths at close range). The extra effort they put into smoothing the way for us was much appreciated!

We would like to thank Richard Nichol and friends for the loan of video and lighting equipment. As a result, we have a video tour of Gribnif Software's product line, revelations about a new TOS and FSM/GDOS, further enlightenment on hardware accelerators and a whole lot more for our members to absorb.

We, at ASTMUM, would like to extend to members and others in the Atari community our warmest wishes for the Holiday Season and success in the New Year!

Adieu for now!
KCM

B.R.A.C.E.

B.R.A.C.E. (Bluegrass Region Atari Computer Enthusiasts) meets the third Tuesday of each month from 7:00 P.M. - 9:00 P.M. in Conferrence Room B (located on the 4th floor), of the downtown branch of the Lexington Free Public Library. The current membership dues are $15.00 per year for an individual membership, $20.00 per year for a family membership, and $10.00 per year for an associate membership (an associate membership includes receiveing the monthly newsletter (AIM), but excludes the use of the library).

President Hal Nason (606) 269-8989

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM monthly magazine, access to the 8-Bit and ST club libraries, monthly meetings, monthly AIM public domain disks, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 South 2275 West, Roy, UT 84067.

Your elected 1991 L.A.C.E. Club Officers are:
Mike Russel President (801) 546-0707
Doug Hansen Vice President (801) 393-6849
Ken Karchner Secretary/Treasurer (801) 776-8015
Richard Clark 8-Bit Librarian (801) 825-5823
Kelly Knecht ST Librarian (801) 773-5652
Irwin Brooks Publications Coordinator (801) 731-1516

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7 p.m. Mark your calendars for the next three meetings. November 13, December 11- Games Night!! January 8, 1992.

If anyone asks, tell 'em you saw their ad in AIM!

MACAM

Montreal ATARI Club ATARI de Montréal

The Montreal Atari Club Atari de Montréal (MACAM) is possibly the only bilingual club in North America which supports both the ST and the 800/XL/XE series of computers. We meet twice monthly at the Monkland Recreational Centre at 4410 West Hill in N.D.G., Montreal, P.Q., on the 1st and 3rd Thursdays of the month. The 1st Thursday is for 8-bit members, and the 3rd is for the 16-bit section.

Membership is $25 for 8-bit owners, $30 for ST owners, and $35 for those who have both machines. Membership includes the A.I.M. magazine subscription, Atari User magazine, our own disk-based newsletter and free access to the A.I.M. disk of the month for the appropriate section(s).

MACAM's mailing address is at P.O. Box 5418, St. Laurent, PQ H4L 4Z9. Further information can be obtained by calling Emanuel at (514) 744-3527 or Terry at (514) 696-3773.

Les membres francophones ou anglophones sont également bienvenues, et les renseignments sont disponibles dans les deux langues.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

September Meeting Minutes

This was a double event, MACE officer elections were held, and we had a swap meet with some nice deals going on. The September meeting came to order at about 7:30. In attendance were about 25 people; a couple of people were new to the club. Almost immediately, the election was held and these people became office holders in MACE for the next year:

President Ted Newkumet
Vice President Ed Hanson
Recording/Corresponding Secretary Mark Tappen
Journal Editor Michael Casper
8-bit Librarian Raymond Simmonds
16-bit Librarian David Haykus
Membership Chair Frances Simmonds
Meeting Coordinator Thomas Quattlebaum
Treasurer Denise Tappen

Some of these people have been in office before, although MACE is proud to welcome four new officers: Thomas Quattlebuam, David Haykus, Frances Simmonds and Michael Casper.

The swap meet was started after the election. A lot of software was there for the 8-bit and the 16-bit machines. A 65-XE Game System was for sale as well as a 100-meg hard drive. Personally, I think the hard drive was the best bargain of the night. Those of you who play adventure games would have loved the swap meet, as there were quite a few of those waiting to be bought.

Other MACE News

At the executive meeting, the new president started by going over each person's responsibility as far as what was expected of them. Then he went over the next year's goals for the club, which include the increase in attendance, the number of disks for sale, the content of future meetings, need for a BBS, etc. The BBS issue was being talked about at the meeting; one member has offered to let MACE use his, which is currently under investigation. Ideas for meetings for the next year were offered by some of the officers. The financial situation of MACE was then discussed, with ways to improve its figures over the next year. All in all, I would say it went well for the new executive membership.

MACE Special Events

As far as future news is concerned, the president announced that there will be a scavenger hunt for Christmas. The Great Atari Scavenger Hunt (as it will be known in the annals of history) is about Atari. Who's got the oldest Atari machine? Who's got the most complete 2600 VCS collection? Bring in those special/unique Atari items. Remember, the oldest Atari might be in your own closet (check the serial number tonight!).

The Great Atari Scavenger Hunt is open to all M.A.C.E. members. Prizes will be awarded in the following categories:

Oldest Atari Product
Most complete PONG Game Machine
Most complete collection of Atari-related objects
Most complete Atari 2600 VCS Collection
Oldest Atari 8-bit
Most Modified Atari 8-bit
Largest 8-bit software collection
Oldest ST
Most Modified ST/TT
Largest 16-bit Software Collection
Newest ST/TT
Atari PC
Most unusual Atari-related Product
Most unusual Non-Atari Computer

Winners will win prizes such as free disks from out 8-Bit and ST Libraries as well as bragging rights for being a true Michigan Atari Computer Enthusiast! Everyone who enters will receive a free Participation Raffle Ticket. What's that? Come to the meetings and find out.

We are also having a raffle to top off the Christmas meeting. Prizes will be demo'd at the next few meetings before our Christmas meeting.

For the MACE birthday party we will be concluding our Participation Raffle which runs until our birthday party meeting. The Raffle is being held to get people involved in MACE.

MID-OHIO ATARI USER GROUP

The Mid-Ohio Atari User Group (MAUG) meets once a month (no July meeting) at A&B Computers located at 1151 Park Avenue West (in the West Park Shopping Center). Meetings are from 7:00pm until 9:00pm on the third saturday of the month. A&B can be contacted at (419) 529-9999 for meeting confirmation. For more information about MAUG feel free to contact Chuck Steinman at (419) 529-9797 from 1:00pm-5:30pm Eastern time.

MAUG supports all the various Atari computer models and their users. AIM is the official user group magazine, and is included as part of the $12.00 annual dues (effective 12/91). Each member in good standing receives AIM each month (or as published) mailed to their home. AtariUser magazine is also available free to local members at A&B Computers, or Walden Bookstore in the Richland Mall. Back issues of AtariUser are available for $1.00 each (limited supplies available).

The club maintains both an ST and 8-bit disk library. We have all of the available AIM disks-of-the-month. These disks are available to anyone whether a member of MAUG or not. The AIM ST disks are $4.00 each, with quantity orders (three or more at the same time) being $3.50 each. The 8-bit disks are $3.00 each, and quantity orders (three or more at the same time) are only $2.50 per diskette.

Dues which are payed by check or money order should be sent to: MAUG c/o Chuck Steinman, Post Office Box 134, Ontario, OH 44862, USA. Please make the check out to "MAUG c/o Chuck Steinman". Once payment is received, you should expect to see your first magazine in approximately 6-9 weeks. Since orders are placed to Unicorn Publications the second week of each month, you should send your payment to arrive at least a week before that time to minimize the period before your first issue arrives.

R.A.C.E.

President Lewis Midyette 828-4319 Vice President Eric Schofield 851-5134 Secretary Don Nelson 942-2764 ST Librarian Tony Manino 851-8092 8-bit Librarian Arthur Katz 880-2047 Treasurer Jim Harrop 851-5134 BBS SYSOP Robert Yates 552-7053 Galaxy BBS 552-0974

Well gang, this is Eric, your current vice president. Things are going well in the Atari world and I am quite happy with the way things are going with the club. The membership is up, the attendance to the meetings have been pretty consistent, and the BBS is more active.

Let's keep things pumping on the BBS. Remember, this is your source for keeping up with the club. It is not the officers' responsibility to contact you every single month about when the meeting will be held. It is your responsibility to find out. Call the board and look under BULLETINS. The section "A word from the president of R.A.C.E." will give you details about the next meeting.

That's it for now gang, if you need any help, please get in touch with one of the officers or better yet, post a message on our BBS and let the whole club try to help you. Next month's meeting will be on January 15 at the Richard B. Harrison Library. Don Nelson will be showing off PageStream 2.1 and we will also auction off some versions of the software.

SALSA

ST Atari League of San Antonio

ST Atari League of San Antonio (SALSA), P.O. Box 18731, San Antonio, TX 78218.

SALSA is a users group for 16-bit Atari users, but also supporting the next generation of Atari computers: Mega STe/TT/Lynx. Meetings are held on the second Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, TX, from 7:00PM to 10:00PM. Special events are held from month to month depending on interest. New user classes are held each month to help users to learn the best ways for traversing the GEM environment.

Membership dues are $20.00 per year and members receive AIM as well as the option of receiving the club's newsletter. A one year membership without AIM is $15.00 and includes the club's newsletter. A subscribing membership is available to those not able to attend meetings and includes the clubs newsletter and all discounts available to normal members. A Disk of the Month is available at each meeting for $2.

President Kyle Miller 512-945-9469
Vice President Frank Hense 512-655-5411
Secretary/Treasurer Chris Cassaday 512-696-8057
Public Relations Doug Moen 512-659-7492
Software Librarian Shannon Stennis 512-666-2923
Hardware Librarian Russel Gibson 512-899-2797
Newsletter Editor Pat Birch 512-655-8970

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public. Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, SDACE newsletter subscription, and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President Michael Bergman (619) 558-7866
Vice President Danny Rickey (619) 565-2179
BBS - 24hrs, 300-2400 baud, 65MB (619)689-8157

Greetings once again from San Diego (America's finest city)! After coming off of the HACKS Atari Show in Glendale last month, everything has slowed WAY down. The weather finally turned nice, people touched up their tans, and their computers are still trying to recover from the glut of software and hardware add-ons purchased at the last computer show. My computer is suffering the same sort of dilemma most of us feel after Thanksgiving—too stuffed to function. I haven't even opened up all of the wrappers on my new goodies yet!

On the plus side, San Diego now has four Atari-supporting BBSes, with two added in the last year. Articles concerning Atari computers, both 16-bit and 8-bit have been appearing in the local computer support magazine, normally frequented only by the MS-DOS and Macintosh crowds. With 75,000 copies published weekly, our exposure is going up and all indications are that there is still considerable interest in Atari products. These indicators, plus the substantial turnout at the Glendale show should give comfort to those of us who stand by our machines!

On the minus side, with the beginning of a new school semester, we are losing some of our more talented folks as they bury their noses in the tomes of higher education. Michael Bergman will be stepping down as SDACE President shortly, returning to status as a full-time student. On behalf of the members, we'd like to thank Mike for a job well done, and for some nice programs as well (Is the desk accessory animation your swansong?). We will have elected new officers by the time you read this and hopefully will be working on a new schedule of product demonstrations and tutorial sessions. Join us at any meeting, you're always welcome!

SAGINAW/TRI-CITY ATARI USER GROUP

STAG

There isn't much to report on this month since only three ST and two 8-bit people showed up. Two of the ST faithful were the hardware volunteers! Apparently the interest is not there. We will contact you by phone before the November meeting to find out if there will even be a meeting. The future of this Atari club is uncertain at this point. Several options are available:

1. Continue as we are, with low meeting attendance.
2. Meet at someone's home so nobody will have to bring equipment.
3. Poll by telephone each month, meeting only occasionally.
4. Disband the club. a. Refund the unused portion of the dues and divide the rest. b. Buy some software and hold a drawing.

If anyone has a suggestion, please speak up. The club you save may be your own.

C:\FL\Jacksonville\STargroup
Friends, Fun & Atari STs
DTP MIDI GRAPHX GAMES WP +

The STargroup is a computer club specifically for helping members use their Atari STs. Our yearly dues are only $15 and now include a quarterly newsletter along with a year's subscription to AIM. Other benefits include free access to our library of over 50 megabytes of Lharced public domain and shareware programs for your Atari. The club BBS, the Bandersnatch, has had a fatal hard drive crash and thus no longer exists. We do have a message section on Lief's World (904) 573-0734 thanks to the generous sysop Lief!

The turnout at our October meeting started out a little small, but as the night progressed STargroup members filtered in one by one. The majority of the meeting was taken up by an eyewitness report of the WAACE show by Pat Augustine, our Vice President. He brought back lots of goodies, including the new DC Data Diet and the CodeHead's MultiDesk Deluxe. Unfortunately, he has not been able to use them yet because his 2.5 meg 520ST died just last week. Pat is happy to say a new STE along with a full set of four one meg SIMMs is on the way!

I am still trying to work out the joint meetings with another local Atari users group, FACE. It looks like we will be meeting with them either the 3rd or 4th Tuesday and the normal STargroup meeting will be the 1st Monday or Tuesday of each month. When they become firm, I will place the meeting dates here.

The STargroup meets on the first and third Tuesday of each month at the La Mirada Apts. off of Powers Ave. in Jacksonville, FL. Everybody is welcome.

President S. Michael Hallack (904)646-0567
Vice President Pat Augustine (904)737-8452
Disk Librarian Jeff Holland (904)737-8452
Secretary/Recruiter Bob Waddell (904)737-1905

WAUG!

WAUG General Meeting Minutes, October 8, 1991

The Washtenaw Atari Users Group meetings are held every second Tuesday of the month at 7:30 PM in the Michigan Union building on the campus of the University of Michigan on State St. at the corner of S. University in Ann Arbor, MI.

Club dues are $15 per year and provide access to the PD library and a subscription to AIM. Meetings feature demos of both 8-bit and ST hardware and software. Non-members are welcome to attend and questions are invited. Officers can be contacted by calling Craig Harvey at (313) 971-8576 or by calling the MOlin's Den BBS at (313) 451-0524.

The September WAUG meeting was opened at 7:30 PM by President Dave Brzezinski as he passed out tickets for our monthly free raffle. The meeting began with a showing of the video tape from the recent Windsor/Detroit Atarifest. It was a little long in some places but contained some interesting interviews with such luminaries as Jeff Earle of Atari Canada, Nathan Potechkin of ISD Marketing and, of course, the infamous Charles Johnson "bathroom interview."

After nobody could stand any more of the tape the meeting got down to some real attractions, mainly the showing of a TT computer brought by Bill and Pattie Rayl. Bill showed the members some demos of 256 color GIF pics and displayed the full color cover from AIM on the TT alongside the black and white image of the same cover on the club's STE. He then spoke for a while about some of the hardware features of the TT versus the ST, more ports, a real SCSI port, a LAN port and the provision for a VME bus add-on card. Bill liked the speed (32 MHZ) and color capability of the TT, but was somewhat disappointed with the fact that the memory upgrades were proprietary to Atari.

8-bit Librarian Dick Selke presented the AIM disk-of-the-month to the members as a welcome addition to the club's library.

Mike Olin then took the floor to once again present a cornucopia of ST disks to any interested parties—two disks full of games, a music disk, a utilities disk, the October AIM disk, and several disks of assorted programs provided something for everyone.

A proposal was brought to the floor by Mike O. that since we would have to purchase another 8-bit hard drive interface for the club that there might be some interest among the club members in making a group purchase of several. Anyone interested should make an effort to contact Mike.

Mike also talked about his efforts to get Soft-Logik user group copies of Pagestream 2. No go. Since we had gotten copies of Pagestream 1.8, we were not eligible to receive version 2.0. Well, it never hurts to ask.

VP Craig Harvey then spoke briefly about his difficulties in finding the Panasonic C1391 monitor that the club had decided to purchase. They could be found alright, but not at the price we wanted to pay. Craig did, however, finally succeed and we should have our multisync monitor in time for the November meeting.

The monthly free drawing came next with the lucky 8-bit winner getting "Drop Zone" and "Command" going to the ST chosen one.

As the meeting was adjourning amidst brisk sales of library disks, Craig decided to stir up some more action by announcing that Version 2.25 of EdHak was available for immediate shipping. (He had some in his pocket).

Jeff Williams of ICD reported, "We did very well with sales of all our products at WAACE. It was great to get to talk with so many loyal owners of ICD products. The ICD booth was very busy. We had a new product that just blew off our tables (and also the tables of other dealers carrying it at the show). It was the AdSpeed STE, the new cousin of our popular AdSpeed ST. It's expressly for 520STE and 1040STE systems. It comes complete with a math coprocessor socket, so all of you DynaCADD users, as well as users of Lexicor Software's Phase-4 products, can add more punch to these applications if you choose to add a 68881 or 68882 (DynaCADD, at this time, will only use a 68881). And installation is pretty easy since Atari has the square 68000 socketed in the STE systems. AdSpeed STE just plugs in and goes!"

ICD's Tom Harker adds, "This WAACE was our all time best American Atari Show which is saying a lot considering the small crowd. I thoroughly enjoyed it."

Ron Coleman of Sudden, Inc. says, "My sales were up 50% over Glendale, which was also a very good and profitable show. The word is starting to get out about Sudden View, but I think [WAACE] did a great job getting warm bodies with cash to the right place at the right time."

Paul Wu of Omnimon Peripherals/WuzTek said, "Omnimon Peripherals Inc. made its first WAACE appearance and I am glad we went. The show was well organized and the public was enthusiastic. To give you an indication of how good the sales were, we sold out of all five of our Omnimon Rainbow monitors we brought with us in the first five hours. Our new Omni-Chrome graphics card and HDrive disk system also received enthusiastic response.

"On the first day of the show, both Noel and I were pretty much glued to our booth busily giving demos. By Sunday, for the first time in our 3-year show-going history, we ran out of brochures (and we brought lots of them!). Besides making sales, we also had a good time meeting new people and making new friends. We also gave away DEKAs, Xwitchits, and T-shirts as prizes to lucky winners."

More Comments

John Townsend of Atari commented, "As for the show, Saturday was packed! Ken Badertscher and I did an 'Atari: Technically Speaking' seminar on Saturday afternoon and we played to a full house. It was standing room only. Ken and I have done a number of these seminars at various shows and really enjoyed them. But, I must say, the seminar we had on Saturday was by far the most enjoyable for me. We had a group

QUICK ST 3.0

Accelerator for the ST and TT

Speeds up most ST and TT software.

Triples the speed of text and graphics redraws.

Faster than Quick ST II and Turbo ST 1.84.

ST, Mega ST, STE, Stacy, and TT compatible.

Supports Moniterm and ISAC monitors.

Works in all ST and TT screen resolutions.

No hardware changes required. Requires 50K RAM.

Emulates 1280x960 screen on monochome ST.

Includes Quick Index benchmarking software.

Installs background pictures on any desktop.

Maximum Speed Only $34.95

Upgrade from Quick ST II or Turbo ST for only $15.

"Fine print bonus": mention this ad and save 20% before Dec. 25, 1991.

Quick ST 3 is available in Canada Europe and the US.

GEMULATOR

Atari ST Emulator for the PC

Today, many ST users use PCs at work and school. PC emulators do a minimal job of emulating the PC software on their STs at home, but they are slow, difficult to install, and can't emulate VGA graphics. What a waste of time!

Our solution is to use the power of PCs to emulate the ST. As emulation experts we took on this challenge. Remember, we wrote the **ST Xformer** Atari 800 and Apple II emulators. Then we emulated the 130XE, connected the 810 drive to the ST, and wrote full speed TT and PC versions. ST emulation was the next logical step!

Gemulator is our ST emulator. It achieves full speed 68000 emulation, fully emulates all ST and TT screen resolutions, and uses the same mouse and 3.5" disks that you use with your PC. It can even multitask with other PC software.

For details send a SASE or visit us at 1992 Atarifests.

of people with some great questions for us to answer, and they really were a pleasure to talk with. They even laughed at some of our really lame jokes! What can be better than that? :-)

"I also met some people I had not seen for awhile or hadn't met before. I had the opportunity to see HyperLink for the first time, and it was really interesting talking with George and Dave at the show. This product really looks interesting and I can see a great deal of potential for it in the future. If you haven't looked at HyperLink, give it a look at one of the upcoming shows. It really is neat and getting neater all the time! :-)

"Dave Small did one of the most interesting talks I have ever seen. And, considering Dave's reputation for talks at shows, that is saying something. His "music video" demonstrating Burst Mode was pretty neat, certainly a step off the normal path. It was also great to see Dave hand out Spectre 128s to people at the seminar. For those that don't know...Dave handed out Spectre 128s at the show as a way of saying 'Thank you' for all of the support you have given him over the years. It was a mob scene!"

Charles F. Johnson of CodeHead Software said, "Wow. Great, great show. I'm stunned. I'm speechless. Somebody pinch me, I must be dreaming. Ouch! Hey, that was too hard!

George Richardson of Gadgets and Merlin Group

"It was a fantastic show, and not just for the sales (which were twice as good as our previous best show), but for the positive attitude so many showgoers expressed. I had a great time talking to all the folks who stopped by our booth and I wanted to publicly say 'Thanks!' to everyone who came up and introduced themselves. It was really cool. (Essentially, I talked and demonstrated _nonstop_ for both days. Whew.)

"We sold out of MultiDesk Deluxe the first day, before the end of the show. So, on Saturday night, we spent a few hours in John's room duplicating more disks, with Dave Small providing entertainment as CodeCopy chugged away. (Dave certainly has a way with a hotel room TV set; in his hands it becomes a sort of psychic lug-wrench.) <grin>

"We had tons of interest in Avant Vector. Believe it or not (and I'm still not sure I do) we sold every copy we brought to the show and took orders for more. Pinch me, somebody! Ouch! In about ten seconds, I traced the CodeHead Software logo and converted it to vector graphics. Then, in another ten seconds, I created a shadowed, skewed (italicized) and rotated version of the logo, with a grey-filled "sun" image behind it...ending up with a very professional graphic in less than a minute."

David Thompson of JMG Software International said, "Been a long time since I've been in one room with so many exited Atari Users and Happy Atari Developers! It was definitely worth the trip.

"As far as Saturday's Banquet goes... Fortunately I didn't get hit with any of the flying tomatoes, cucumbers, olives, etc that tended to mysteriously make their way from our table (the ISD side of our table that is) to the CodeHead's table to Dave Small's table and back. I think it was Nevin at the table in the centre that was causing all the trouble :-) Of course others could say that Nathan brought down Julius just to cause trouble!!!

Talk about a Banquet!

Step Ahead Software's Nevin Shalit (who was also elected the new president of the IAAD at the show) commented, "The banquet was definitely a trip. Dave Small's table was the rowdiest, and did a few well-orchestrated waves (you know, the waves you see at baseball games). There was a little food throwing by various young 'uns at a few tables (but nothing out of hand) and Nathan's speech was very amusing and well delivered. Perhaps the most extraordinary thing was seeing Nathan actually *nervous*. This is the man who has no problem going cheek to jowl with the Tramiels, but immediately before his speech Nathan was as white as a sheet. Once he got started, though, he rolled right through the presentation."

Bob Brodie from Atari added, "The banquet was indeed excellent! The food was wonderful, and I was very flattered to be offered a seat at the head table. Charles Smeton was kind enough to allow me to bring along the people that I'd promised to dine with. That means I had the best seat in the house: Michelle Taylor from Atari-Oz on the left, Tricia Metcalf from Gribnif on the right, Darlah directly in front of me! :) Oh yes, and Nathan did indeed give very fine speech. He gave quite a few of us new names (mine is Bobbit), and all of us plenty of laughs."

Atari Explorer's John Jainschigg reported, "Amazing show. Simply amazing. We had the pleasure of giving away 1,000 copies of Atari Explorer's two most recent issues, and of getting, in return, about 100 new subscriptions.

"The banquet was magnificent. Dave Small's table did a set of circular 'deep sala'ams' which really had to be seen to be appreciated. Nathan's speech, in which he assigned caricatures from the Lord of the Rings to major players in the Atari market, was absolutely the stuff that comedy is made of (not to mention the breakdown of cordial business relations (grin)). And, we had the pleasure of seeing people we normally see in T-shirts, in ties!

Dorothy Brumleve added, "I've been to a *lot* of shows, and I have to tell you: this WAACE was the partyingest show I've ever been to! The WAACE crew and Current Notes put on parties and get-togethers before, during, and after the show, and of course there was also the "formal" banquet; there was so much going on on the social schedule that I almost forgot I was there to work!

"Mine was a respectful and dignified table at the banquet. We did not engage in the food fight even when wayward ammunition tempted us (as it landed

How to improve your writing.

Grammar Expert
Online help for the English language

Grammar Expert helps you write more clearly, directly, and effectively. Grammar Expert provides instant, online answers to the questions faced by casual and professional writers every day: *Do I need a comma here? Should I use "who" or "whom"? How can I make my writing more direct and forceful?* And thousands of others.

The GramSlam
Grammar and Style Checker

GramSlam also helps you write more clearly, directly, and effectively. GramSlam catches over 1200 embarrassing grammar and writing-style problems--before anyone else sees them. GramSlam's comprehensive writing-style statistics show you how readable and effective your writing is.

Both GramSlam and Grammar Expert are essential for anyone who writes--students, business people, professional and casual writers. You can use GramSlam and Grammar Expert as desk accessories from your favorite word processor or DTP program.

GramSlam and Grammar Expert. An unbeatable combination for better writing.

within our reach). Next time I intend to be seated where the action is!"

Personal Observations

At the banquet, Craig Harvey, Bill and I were seated where the action was! We were part of the wave at the Dave Small table. To be precise, it was really the Tom Harker/ICD table before we sat down and were later joined by George Richardson and then by Dave Small. Before the dinner got started, Tom and Dave serenaded Charles Johnson and John Eidsvoog at the "CodeHead table" with songs by Neil Young.

Once the unsuspecting waiters served the salads at our table, it was history! Olives were flying fast and furious, and all of us stockpiled our cherry tomatoes in the event of a first tomato strike by the CodeHead table. Tom even went so far as to instruct Dave in the art of catapulting bags of sugar with table spoons. Dave got a lot of laughs when a tomato from the CodeHead table did strike him, putting an end to the crossfire, but not the kibitzing during the speeches.

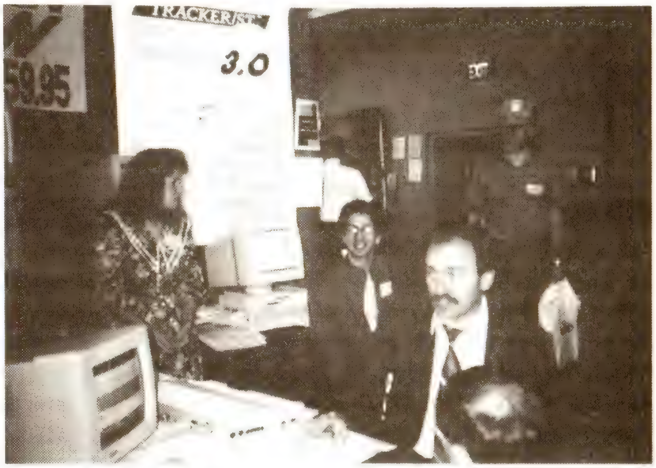
The rest of us poor souls were just putty in the hands of masters Tom and Dave. I forget who suggested the wave—it was either Tom Harker or Jeff Williams, I think—but we all complied! When Joe Waters was listing off the names of people who've helped him over the year, we all were encouraged to chant the name of each person. At one time, I thought we were chanting "Seafood," but it turns out we were saying "Steve Two" because Joe has a lot of Steves on his staff!

Paul Wu of Omnimon and Rich Betson of Rimik

The quote of the evening came during the food fight when someone leaned over to Craig Harvey and said something about how expensive the meal was. Craig said, "You're not paying for the quality of the food; you're paying for the atmosphere!"

This wasn't the only rowdy time, by any stretch of the imagination, just the main one "officially" sponsored by WAACE! Dave Small and George Richardson were quite a team during the "before the show, but after setup" open bar and refreshment time on Friday night. I watched as Dave set "a new speed record" when he cranked a Mega ST up to 7.1 MIPS (million instructions per second) with the SST board just to see if it would work—a "normal" ST does about 0.7 MIPS. Meanwhile, George was standing next to me shaking his head and saying the equivalent of "Don't do this at home, kids."

Step Ahead Software's Nevin Shalit (middle) shared a booth with the Colemans of Sudden, Inc.



We got to hear all sorts of stories during the relaxing times of the weekend. George Richardson and Tom Harker shared stories about how they each started out with very small companies in their garages or whatever, because they found they couldn't work well in the normal workforce.

George even had pictures of a real R2D2 robot he designed from spare parts that actually worked. He said the little robot won a lot of Halloween costume contests, but he had to decline them because the little guy wasn't in costume and wasn't human. I believe it! I guess that says a lot about how good this guy is with hardware. (George Richardson did the hardware design of the SST030, MegaTalk and Chromax color boards, all sold by Gadgets by Small.)

Jim Allen shows off his accelerator boards in the booth he shared with ISD Marketing

For me, the nicest part of the socializing came after the show on Sunday night. Ralph Mariano (ABCO Computer and ST-Report), Charles Johnson, John Eidsvoog, Doug Hodson and friend Brent (Rising Star), and Bill and I were joined later by Maura Fitzgerald and John Jainschigg in the Sheraton's bar.

Charles and Ralph were talking about custom cases for musical/MIDI equipment which lead to talk about Charles's playing in GreyHound commercials. I said that I'd probably heard him play, when John mentioned that he plays the music in Barbie commercials.

I then commented about how expensive Barbie's gotten these days saying I could remember when Barbie only cost $3.95! This lead to a commisseration between myself and Maura. Her mother always bought her generic Barbies, which we both agreed weren't as good.

Charles talked about how he always wanted shoes with real springs in them. He talked about the ones that briefly appeared on the market, but weren't any good, and got pulled because they caused a lot of broken bones. John Eidsvoog told us how he had always wanted a pogo stick, and when he finally got one, he couldn't get it to work right. John Jainschigg always wanted a unicycle, and he was envious of Charles because Charles had one when he was younger.

I guess the moral of the story is that computers, and especially computer shows, let you be a young kid again? Or, how about stick around after the shows to see the human side of your favorite developers!

FREE Installation video w/ purchase of ram board w/ chips!

Howdy Partner!

S T / I M E

Lithium 10 year battery backed-up clock and calendar module that fits in all the ST's. Install it under all the St's. Install it under one TOS ROM chip and all your files will be date and time stamped correctly. Comes with digital corner clock display. Frees up your cartridge port. Stop wasting time setting time! 3yr.warranty NOW STe COMPATIBLE!

~~$59.95~~ $49.95

Z-SIMMS STe SIMMs

NOW expand your new STe with Z-SIMMS, the STe 1 Megabyte SIMM module that expands an STe to 2 or 4 Megabytes. 1yr. warranty. Highest quality and with STe installation instructions.

~~$79.95~~ $54.95

Z-KEYS

- ✓ IBM-PC/XT keyboard interface to the 520STFM/1040ST
- ✓ Solderless internal interface that is easy to intstall.
- ✓ Complete manual and disk included.
- ✓ WORKS WITH PC/XT KEYBOARDS. $79.95

With Keyboard: $129.90

Z-RAM/2.5 MEG

Ultra low-profile solderless 520ST/520STfm/1040ST 2.5 Meg memory upgrade. Fits under all RF-Shields, including the older 520ST's with external disk-drives. Plug & Play! Comes with 1 yr. warranty, detailed manual, RAMdisk software and diagnostics on disk.

$99.95 ~~$129.95~~ w/o RAM
$229.95 ~~$279.95~~ with RAM chips

Z RAM/Mega 2-to-4

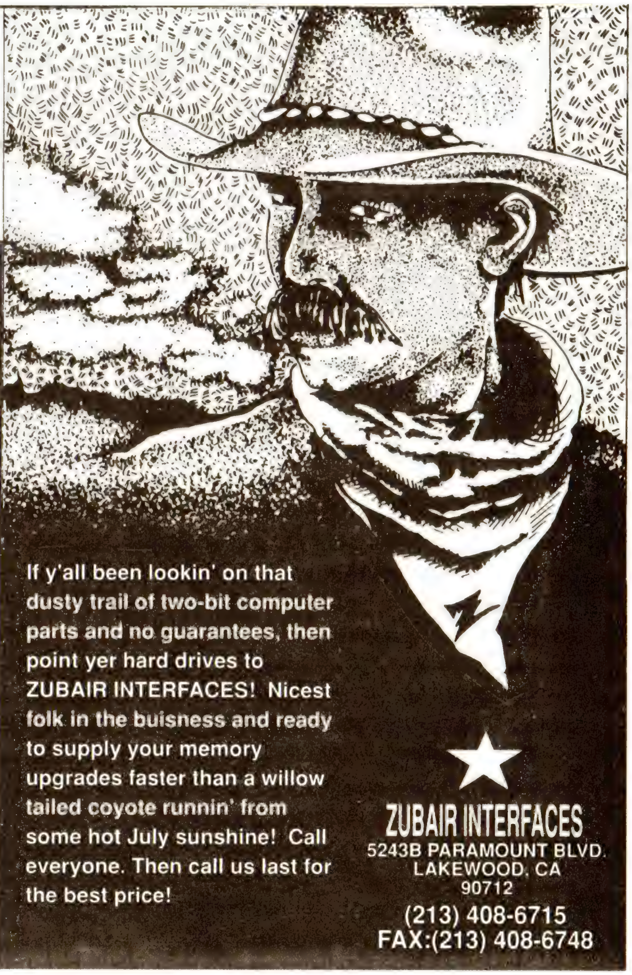
Solderless Mega2 Ram upgrade to 4 Meg. Plugs into the Mega2 and will not interfere with internal hard-drives. The easiest way to upgrade your Mega2 without soldering! Comes with complete instructions and diagnostics disk.

$99.95 ~~$129.95~~ w/o RAM
$229.95 ~~$279.95~~ with RAM chips

Z-RAM 3-D/4 MEG

Innovative 3-D double decker boards fit into the video-shifter metal box of the ST. Memory diagnostics and RAM disk software included. 1yr. warranty and 30-day money-back guarantee. Super reliable data and ground connections make this *the* upgrade board for your ST.

0K (no chips) ~~$149.00~~ $109.95
2.5 Meg ~~$299.95~~ $249.95
4 MEG ~~$479.95~~ $379.95



If y'all been lookin' on that dusty trail of two-bit computer parts and no guarantees, then point yer hard drives to ZUBAIR INTERFACES! Nicest folk in the buisness and ready to supply your memory upgrades faster than a willow tailed coyote runnin' from some hot July sunshine! Call everyone. Then call us last for the best price!

44Mb ST Cartridge Drives $599
60Mb High Speed 24Ms ST Hard Drives $399

Hard drive systems come pre assembled, tested, and include 115/230v power supply, cooling fan, Free Public Domain software on request, 2 year warranty on SyQuest, 1 year on fixed drives, boot/partitioning software, cables and instructions for use on your Atari ST/TT computer.

Case Styles

SB-Shoebox 2 drive 7"w x 7"h x 14"d

UM-Under Monitor
2 drive capacity, 15"w x 3"h x 14"d,

UM4 - Under Monitor 4 Slots for 2-5.25" & 2-3.5" drives, (not shown) 16"w x 4"h x 16"d

MIDI Rack Professional 2 Drive shock mounted, 19" Std. Rack, 3 space height x 10.5"d, black, front mounted switches. (not shown)

CS2 - Compact New single drive unit is the smallest SyQuest system available for the Atari ST/TT. Can fit in briefcase. 9.5"w x 10.25"d x 2.5"h. ICD Host SCSI ID switch and SCSI expansion port included.

Host Adapters

Supra with Clock Supra host offers the most options for the money for the Atari ST/TT. Includes the excellent Supra Utilities software.

ICD and ICD+ The standard for Atari host adapters. The ICD host offers very comprehensive software, and comes with free disk caching utilities to speed up performance. ICD+ has real time clock.

BMS Berkley Micro Systems - Fastest data transfer available. Add $10 to ICD+Price.

Dual CPU

This internally mounted switching system enables the user to hook one SyQuest Drive up to two different computers at the same time. By simply turning a switch and changing the cartridge, one can go from running on an Atari ST/TT to a Mac, PC/AT/386/486, MIDI Device, or an Amiga in a matter of seconds. Add $220 for Dual CPU Option. Includes SCSI Port & SCSI ID Selectors and 1 SCSI Cable. Free SyQuest DOS or Mac Drivers on request.

SQ44/SQ88ST

(Answers, Tips And Relevant Information)

Multitasking on the 8-bit Atari?

Paul Alhart (AFED)

Questions that Keep Me Awake at Night

Have you ever wondered about some of these things. Like, why would someone put a door in a building and then put a sign on it that read "This door must remain *closed* at *all times?"* Why are images in a mirror reversed left to right, but not top to bottom? Why can't *my* computer do two things at the same time?

Well, these, and other such questions, have troubled me for some time.

Here is another that has really been bothering me. I increased the memory in my Atari to 256K. The basic computer accounts for 64K of that, leaving 192K of extra memory to be used via bank switching. I normally boot up with two single density RAMdisks.

Each RAMdisk consumes 90K, so that is 180K for both. A quick check shows 12K left over. What good is this extra 12K? It's not enough for another RAMdisk. How do I know if it even works?

Recently, in hopes of getting a better night's sleep, I went on a quest for answers to some of these puzzling questions. I'm still trying to find out about the door and the mirror, but I did solve the extra 12K problem. At the same time I was able to get my Atari to kind of do two things at once.

Actually, your 8-bit Atari is doing a lot more at one time than you may realize. Sixty times a second it checks the joystick ports, updates the color registers, updates the screen display and a whole lot more. All the while, it appears to be doing nothing more than waiting for you to press the next key.

It accomplishes all these things through the use of interrupt routines—a bunch of short machine language programs that are a part of your Atari's operating system. Although only one thing is really being done at any one time, they are done so fast that it appears as if they all are happening at once.

Knowing all this and little else, I decided to try and write a program I had been kicking around in my head for some time—a calculator program.

No, not just another calculator program, but one written in Assembly language, that resided in this extra 12K of memory, and could be called as an interrupt routine. That way, I would always have a calculator handy even if I was running a BASIC program, writing a program in PILOT, or just working from DOS.

It turned out to be quite a learning experience. My first problem was to figure out which 12K of the extra 192K was free to use. Then, I had to determine how to get the code to boot itself into the extra 12K of RAM. Having written only one program in Assembly before this left me with lots of book work and experimentation to get it all to come together.

But what I ended up with surprised even me—MagiCalc XL.

MagiCalc XL

Pressing a "Hot Key" combination instantly stops the current operation dead in its tracks and transfers control to MagiCalc. The four function calculator displays entries and results in Decimal, Hex and Binary all on the same line so conversion between numbering systems is unnecessary by the user.

Entries can be Decimal or Hex and mixed operations are supported such as (1234 * $ABCD). PEEKs and Double PEEKs are also supported. Upon exiting MagiCalc, the computer will resume what it was doing before you accessed MagiCalc.

OK, so it's not true multitasking. It is really two programs resident in RAM at the same time, similar to a desk accessory on an ST. It fooled my wife, though.

Some of page 6 had to be used for the calling routine, so it won't be 100% compatible with all programs or cartridges. But, if I ever need a calculator or just a number conversion while programing in BASIC, Turbo BASIC, Pilot, DOS, etc., MagiCalc is just a key stroke away.

Although written for a RAMBO 256K XL, MagiCalc XL will also work on any 256K or greater 8-bit Atari that uses the XE bank switching scheme. (Switch address $D301). It will run on a stock 130 XE as well.

It can't be used with a RAMdisk on the 130XE, however, as the RAMdisk uses all of the 130's extended memory.

MagiCalc XL only uses a little over 1K of this extra RAM, but now I know that the extra RAM works and at least one thing it is good for.

It's time for me to head off to bed now. If only I could figure out the door and mirror questions. And "What if I had two different programs in that extra RAM at the same time?" How about three programs, or four, or five, or...?

Postscript

Due to a strike called by my local union last week, I am presently unemployed. Therefore, I have decided to offer MagiCalc XL as Shareware in hopes of making millions of dollars and keeping my creditors at bay. Look for MagiCalc XL to appear on a future AIM 8-bit DOM.

If you can't wait, you may order the program and documentation disk directly from me for $6. For $10 I will also include my complete and heavily commented MAC65 source code that you can study, modify, or use to create your own Extended RAM programs.

Lompoc, CA 93436

A-T-A-R-I CONTINUED CREATIVE PROGRAMING

There are as many ways to code a routine as there are programmers to do the coding. The following four short 6502 assembly routines all do exactly the same thing but in different ways. They all cause a system "Cold Boot" by executing the Atari operating system COLDSV routine located at address $E477 (58487).

Listing 1

```
    JMP $E477
```

Now that is pretty straightforward. This routine uses 3 bytes and takes only 3 clock cycles to execute.

Listing 2

```
    LDA #$77
    STA DUMMY+1
    LDA #$E4
    STA DUMMY+2
DUMMY JMP $FFFF
```

In this case, a jump to a dummy address ($FFFF) is set up. The new address ($E477) is then written in place of ($FFFF) during program execution. (13 bytes & 15 clock cycles.)

Listing 3

```
    LDA #$77
    STA DUMMY+1
    LDA #$E4
    STA DUMMY+2
DUMMY .BYTE $4C,0,0
```

This is the same as Listing 2, except the dummy jump instruction was replaced by the three bytes ($4C,0,0). $4C is the Machine Language code for JMP. The two 0s are the dummy bytes that are replaced during program execution. (13 bytes & 15 clock cycles.)

Listing 4

```
LDA #$E4
 PHA
 LDA #$76
 PHA
 RTS
```

This is *not* a subroutine. I like to call it The Return From Nowhere. When a JSR is performed, the current address is taken from the Program Counter and pushed onto the stack. When a RTS comes along, the address is pulled from the stack, one is added to it, and it is placed back in the Program Counter.

Program execution then continues using this new address.

In Listing 4, there is no JSR instruction. Instead, we push the address we want onto the stack and execute a RTS. Note that we must subtract one from the address, because the RTS will automatically add one to it. Also, it is pushed onto the stack in the order of High byte/Low byte. This allows the RTS to retrieve the address from the stack in the standard Low byte/High byte order. (7 bytes & 16 clock cycles.)

Listing 1 uses less code, less bytes, and executes in less time than the other listings. Why use anything else? Listings 2-4 allow your program to direct which address to jump to. This can be used to set jump addresses *on the fly*, much like conditional Branches but without the address boundary limitations imposed upon Branch instructions.

Besides, it can't hurt to learn a new programming technique now and then.

HOW WE PRODUCE

Sometimes, I get the feeling readers of Atari Interface think we have big corporate headquarters and tons of staff. Nothing could be further from the truth! I'm always amused when a reader calls up and asks to speak to someone in the circulation or editorial department.

I'm amused because Bill and I are the only "in-house" staffers. We're it! We're the circulation department, the advertising deparment, the mailroom, the Board of Directors—the whole shot.

We get lots of help from our readers, though, and this help is appreciated. All the columnists and users who send us articles are also "staffers," but the only people involved day after day in the nitty-gritty of magazine production are Bill and myself.

I thought I would tell a bit about how AIM is produced and also talk about the software we use to run the magazine and keep track of business. These two topics really go hand in hand, since software is what makes it possible for us to run a business and publish a magazine.

Pattie at work on the Atari STE in the Unicorn Publications "computer room."

Hardware

First off, our hardware set up is very modest. We currently have a newly-acquired four meg TT030, a Mega4/STE we have had since last December, and a four meg STe we've had for almost two years. On the Atari 8-bit side, we have a 256K 1200XL and 810 disk drive that is on loan to us from a devoted member of the Atari Classic community.

Our "crowning pride and joy" is our Hewlett Packard LaserJet II, with Pacific Page Postscript Cartridge. The HP laser has served us well over the four plus years we've had it.

Panic set in a few months ago when lightning struck nearby, announcing a thunderstorm and frying one of the HP's internal controller boards. Fortunately, insurance covered the repair cost and we were up and running in time to print the next issue.

BBS Connection

The STe runs our multi-line BBS, the Treasure CheST. We have a DC Port from Double Click Software that connects to three phone lines (two of them 2400 baud and one 9600 baud). Using MichTron's BBS 3.0 software, we can have up to four people online at once.

The main purpose of the BBS is to give people an easy way to get articles and information to AIM, but we also have a lot of local (and not so local) users calling in. We've even had "online seances" that have been a lot of fun.

Bill's handle on the BBS is Ancient Mariner and I'm Emerald Mermaid. The number for The Treasure CheST is (313) 973-9137.

The BBS is run from our "computer room," the second bedroom in our two

PATTIE SNYDER-RAYL

bedroom townhouse. The magazine has totally taken over that room, and we've even had to expand our work/office space into the basement. We're in the process of shifting the computer room overflow from our living room and kitchen area into the basement.

Text and Graphics

Once the files are collected from the BBS, as well as from the online services and the US mail, Bill uses EdHak (Clear Thinking) to separate the articles from the club minutes and mailing lists.

Bill swears by EdHak, written by WAUG member and friend Craig Harvey. Bill writes all of his reviews in EdHak, but I still use ST Writer for my share of articles. I've used ST Writer since 1986, when we got our first ST, and nothing has enticed me away yet!

Pictures are as important as the text files, and we use a combination of Prism Paint (Lexicor Software) and MultiViewer Graphica (WizWorks) for graphic editing each month. Prism Paint is good for working with bitmap color graphics, especially in the new TT resolutions. MultiViewer Graphica is almost a necessity for speedy work on monochrome IMG scanned images.

On our "gotta get soon" list of software is an autotracing program such as Arabesque (Gribnif Software), Avant Vector (CodeHead Software) or Silhouette (Maxwell CPU). From playing around with the demo versions of these packages, seeing the software demoed at shows and reading the press releases, they are all very impressive.

Currently, we're leaning strongly toward Avant Vector—it has a more intuitive feel (a purely subjective thing) to the program, supports TIFF and IFF formats and can output GEM, Calamus CVG or EPS graphics. The EPS support is *very* important to us, as we do nearly all our work in Postscript.

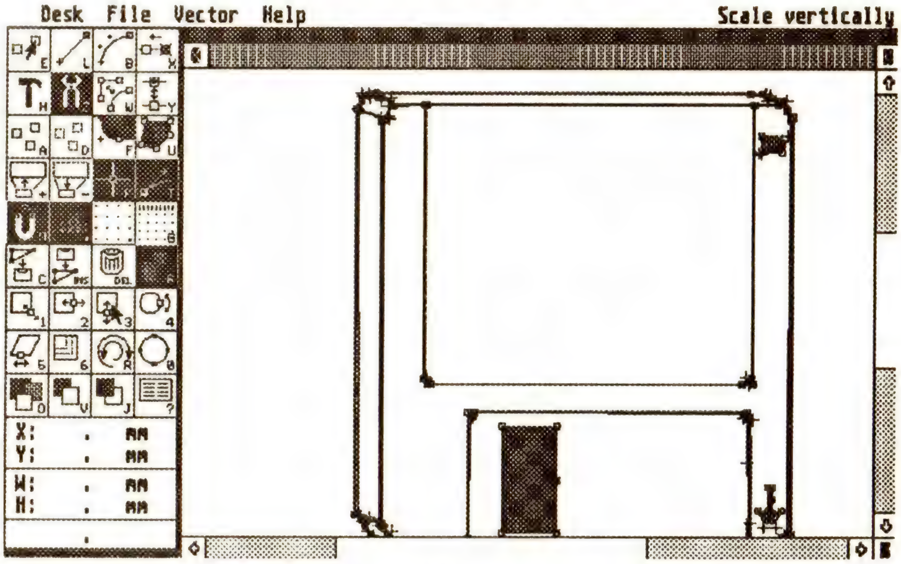
To get snapshots of the programs reviewed, we use an old freeware program called Degasnap. Recently, a cartridge called The Ultimate Ripper (Power Computing) allows us to get "snapshots" from copy-protected commercial software. Prior to the Ripper, we had to take photos of the screens.

Putting It All Together

Editing the articles and taking snapshots takes a few days; longer if we have to write in-depth reviews for that particular issue. Once Bill gives me all the edited files and pictures, I start laying the magazine out in PageStream 2.1 (Soft-Logik Publishing). We'll have an in-depth review of PageStream 2.1 in the next issue or two.

When we first started the magazine back with the December '87 issue, we used Publishing Partner. Then, we moved to Timeworks Desktop Publisher because of its cleaner printed output and ease of use.

Now, with PageStream and Calamus (ISD Marketing), the ST has a solid base for professional DTP. PageStream 2.1 and Calamus SL are as good, if not bet-



Avant Vector

ter, than anything else out there for *any* computer platform.

After seeing a demonstration of the new Calamus SL at the WAACE show, I have the feeling we'll be using Calamus a lot more in designing and producing the magazine each month. The color display and manipulation of graphic elements are exceptional! I look forward to working with SL once the Postscript modules are available.

The Last Lap

Actual layout time of the magazine usually takes about three or four days. During this time, Bill is busily editing the club minutes and making the disks of the month. Bill calls CompuServe and GEnie and downloads any recent files of note. He also receives disks from Germany, the UK and Australia. Usually, Bill weeds through a meg or two of ST/TT software, two or three disks of 8-bit software and several megs of Mac/Spectre software. The best of the files appear on each month's disk, after being ARCed up and made self-extracting. The READ.ME files from each disk are then printed in the magazine.

Once the text files and graphics are laid out, the pages are printed for Bill to proofread. When Bill is finished proofing, we reprint any changed articles, and work on the Table of Contents, Reader's Viewpoint, Editorial Ramblings and Atari Bulletin Board pages. Saving the editorial page and Bulleting Board for last gives us an opportunity to get in late-breaking news before we ship the issue off to the printer.

I then "paste" in the hardcopy ads (using wax) into the places I've left while laying out the pages. I also indicate to the printer where all pictures are to be placed and in what percentage size, and finally, where any spot color is to be used. This bundle is then shipped off to our printer, having taken about a week to week-and-a-half from start to finish.

Once the issue itself is out of the way, we work on the insert, which only goes to direct subscribers and participating user groups. Club minutes and other club news is laid out in an 8-page insert, sometimes filling all eight pages and sometimes not. Finding filler can be a bit challenging at times! Because we create the insert after the issue is already being worked on by our printer, we can get straggling clubs into the issue just as it's about to be mailed out.

Mailing

Mailing is quite an experience! We used to do it ourselves on our kitchen table, merging mailing labels from over 50 clubs and our own direct subscribers, then bundling and bagging all the issues for 3rd Class mailing. We used to cut all those mailing labels up and sort them by hand, first into state piles, then into three and five digit ZIP code piles!

Then, we got smart! Actually, the job just got way too big for us to handle with over 80 participating user

Still Just $18.95 !!

groups now. The first thing we did was get the clubs to send us ASCII mailing lists instead of physical mailing labels. The second thing we did was get an outside firm to do the actual mailing for us. Now, the computer does the sorting—once Bill imports all the lists into SuperBase (Precision Software)—and we take the labels to a local company specializing in magazine and catalog mailings.

Bill takes each month's mailing lists from the participating clubs and runs them through EdHak to get them into an easily importable format. Then, from Tracker/ST (Step Ahead Software), he exports names out of our own database of subscribers and imports all the lists into SuperBase Professional. Once in SuperBase, the lists are double-checked for accuracy of importation. The database is then sorted by ZIP code and ready for printing. About 3,000 labels are printed.

Doing the labels is a lengthy process. Taking the lists from the 80+ clubs participating in AIM and adding our own list of subscribers is a huge task.

Bill has to add or delete club members, compare the lists against those clubs who've paid for that issue, and keep an eye out for importing problems in SuperBase! This job usually takes a couple days, but it is much faster than trying to sort labels from over 80 clubs by hand!

The Aftermath

When the labels are done, we have a little breather—only a little one, though! I start calling developers about advertising in the next issue and do bookkeeping type things while Bill sends out software to reviewers, or "plays" with programs he'll be reviewing himself.

Calling for ads isn't a time-consuming process, but it does take a while sometimes. This is were I get to play phone tag with people! Even though I start soliciting ads at the begining of the month, it may be right up until we send the issue off to the printer that we receive ads from developers and dealers!

During this time, we also start talking about what theme, if any, will be in the coming issue and trying to decide what will appear on the next cover.

Somewhere during all this, we also send the Disks of the Month to be duplicated. The duplication process takes about two weeks. When those are back, we print out the lists from Tracker and stuff diskette mailers. We use PageStream to create the disk labels and print them on Avery laser labels. We send out over 100 ST disks and 50 8-bit disks each month counting clubs and subscribers, and our Mac/Spectre disk is starting to take off as well.

As an aside, I recommend Computers Plus, (800) 433-1216, for laser labels and good, inexpensive disks. We used to use MEI Micro Center for disks, but the disks from Computers Plus are better quality (far less failure rate) and cheaper!

Once the printer is done with the magazine, I send copies to the advertisers. The Canadian and foreign clubs get their issues sent to them in one big bundle. This means creating shipping invoices, which I do in PageStream.

All Canadian and foreign subscriber issues, as well as First Class US suscriber issues, have to be stuffed into envelopes and sent out. We currently have about 40 overseas subscribers, not counting the participating clubs outside the US. Tracker/ST keeps independent track of our non-US clubs and subscribers.

It Never Ends

By this time, we're about ready to start the whole cycle over again! There are times when work from one issue overlaps into the work cycle of the next issue. That is especially true when we have a show to attend, or when one of us is late in completing a task.

Our "helpers," Rumpole (left) and Wimsey

There is a lot of flexibility in our schedule, mostly because we work from home. There is an apt saying I heard in CompuServe's Home Office Forum that goes, "It doesn't matter whether you work the first half or the last half of the day, as long as you get your 12 hours in!"

Bill and I are usually up until midnight (later if it's magazine production time) and, in the morning, I refuse to answer the phone before 9 AM! So, if you're an early riser and give us a call, you're likely to get the answering machine!

Over all this, we try to keep active on CompuServe and answer email on GEnie and our own BBS. We have used Flash (Antic) for ages and haven't found a reason to switch to another telecommunication package, although Bill tells me he's very impressed with STalker 3 (Gribnif Software).

We use the online services to get information about coming products from developers and just to gab with people. Bill and I are often found in the Thursday Night Conference on CompuServe in the AtariArts Forum (GO ATARIARTS) and the Sunday Night CO in the Atari 8-bit Forum (GO ATARI8). On GEnie, we pop into the Gadgets COon Tuesday nights.

Miscellaneous Software

We use a lot of software that doesn't directly apply to publishing AIM. Bill, for instance, likes to play with spreadsheets in LDW Power. We also use commercial utilities like DC SEA and DC Xtract (Double Click Software), MultiDesk and CodeCopy (CodeHead Software), Quick ST and Quick Label (Branch Always Software) and MultiGEM (Rimik Enterprises). I would be remiss if I didn't mention using our Joppa FaxModem and software to send faxes.

PD or Shareware utilities that are also a part of our everyday life include Little Green File Selector, ArcShell and DeskManager (Charles Johnson); Calendar and WhatIs (Bill Aycock); and AUTO folder virus protection programs Vector Checker, Watcher and Vaccine (part of the Hospital package from the UK, available on the March '90 AIM ST disk of the month).

Don't buy another hard disk!

Diamond Back II

Simply the **FASTest**, easily the most **FLEXIBLE**, and absolutely positively without question the most **RELIABLE** hard disk backup and restore program for the Atari ST!

▼ EASY to use 100% GEM user Interface ▼ Online Help
▼ Point and click to select specific backup paths and files
▼ Backup/Restore ANY number of specific files or paths
▼ Creates 100% normal TOS files!▼ Full/Partial Restores

▼ Flexible include/exclude wildcards for backup/restore!
▼ Incremental backups ▼ Load/Save Configuration files
▼ Compression & Encryption ▼ CRC Validation Logs

Extra Special Features:
▼ Backup/Restore **Spectre** partitions! ACK & 3.0 OOP
▼ Intelligent Image option only backs up sectors w/ data!!
▼ Incredibly fast hard disk to hard disk backups!!!!!
▼ Full support for TT and 1.44M High Density Floppies

Same low price: $44.95
Upgrades to Diamond Back II V2.26 are only $5 from any version 2.20+ or only $10 from any version 2.11 or before(w/new manual). Send your original disk and upgrade fee to:

Organizing Your 8-bit Disk Collection

John Kasupski (WNYAUG)

If you are a veteran Atari user, chances are good that you already have an extensive collection of 5-1/4" floppy disks, all loaded with various programs, games, text files, utilities, picture files, music files and every other kind of program and file imaginable.

If you are a new Atari user, rest assured that eventually, you, too, will accumulate such a collection, especially if you have a modem and frequently download files from local BBSes.

For old and new Atari owners alike, unless your collection is well organized, sooner or later you will have problems finding what you are looking for among all the various disks in your software library. A well-organized library means that you spend less time looking for things and more time being productive or gaining enjoyment from your Atari.

This article will offer some good suggestions on how to maintain a well organized diskette collection.

Apples and Oranges

The first key to organizing your software collection is to organize your disks so that related files are kept together. This basically means keeping apples together with apples, oranges together with oranges, and so on.

For example, if you have a large collection of game files, you should have several disks in your collection that have nothing but game files on them, except maybe DOS and a menu program that will load the game you want. Keep all of your game disks together as well (partitionable disk filer boxes lend themselves to this purpose).

You can further subdivide your game category, if desired, for example, by arcade games, adventure games, space games, PacMan type maze games, etc.

Alternatively, you could break them down according to language: BASIC games, Machine Language Games, and so on. The specific way you break things down isn't important. What is important is that you have some kind of system that you understand and are comfortable with, one that will help you keep things separated and organized.

The advantage here is that if all your games are in one place, when the time comes that you are looking for a particular game, you will only have to look through your games disks to find it. You don't have to also look through your word processor text files, database files, utilities disks, and everything else, because you'll know the games aren't in there!

What's in a Name?

Once you get all your apples onto apples disks and all your oranges onto oranges disks, you may want to take a look at the extensions on your filenames.

I run into a lot of files on other people's disks that have totally illogical filename extensions left on them. A file gets downloaded as "StarGame.1NN" and it stays that way forever. The problem here is that three months later, you probably won't remember whether it's BASIC, object code, a text file, a scrunched disk or something else.

The way to eliminate this problem is twofold. First of all, I have yet to see a DOS that didn't allow the user to rename a file. So, change your extensions to something that make sense. Some commonly used filename extensions and their meanings are listed below:

.BAS—SAVEd BASIC programs
.LST—LISTed BASIC programs or routines
.EXE—An EXEcutable machine language program
.OBJ—Machine language object code
.TXT—A text file
.DOC—Also a text file, but .DOC denotes that the text provides documentation for some other file or program on a disk
.COM—Executable machine language files (like .EXE). Certain types of DOS (especially command-driven ones like SpartaDOS, OS/A+ and DOS XL) will load and execute .COM files when the user types the filename without the extension. Can also represent external DOS commands in a command-driven DOS
.DAT—Data files, as for a database, etc.
.AMS—Song files for the AMS music player program
.PIC—Graphics picture file

You could devise a system of extensions for filenames, but if everybody used the same conventions, it would eliminate a lot of confusion when people exchange files with one another.

The second part of the solution is what to do with all the files you already have that you no longer

The second part of the solution is what to do with all the files you already have that you no longer remember the nature of. How do you tell whether that file you downloaded six months ago is a BASIC program, a text file, a machine language file, or data from some database program on yet another disk?

The answer to this problem is to use the WHATIS utility (also available for the ST/TT computers). This program, written by CompuServe sysop Bill Aycock, recognizes common "file signatures" such as the $FF $FF file header at the beginning of machine language files, then reports to you on the results. So, you get "StarGame.1NN is Object Code" and you at least know how to run the program to see what it is.

WHATIS also recognizes SAVEd and LISTed BASIC files, picture files, text files and files produced by a number of file compression utilities, among others.

Judged by Its Cover

Maybe you can't judge a book by its cover, but you can judge a diskette by its label, provided that you develop the habit of clearly labeling your disks with such vital information as what DOS is on the disk, what density it is formatted in and what type of files are on the disk.

There is a public domain utility, written in BASIC, which dumps the directory listing of a disk onto one or more standard 3-1/2"x15/16" mailing labels such as Avery #4253 or similar. This lets you see at a glance exactly what files are on a disk, saving you the time and trouble of repeatedly swapping disks and typing DIR or A-[RETURN]-[RETURN] or whatever method your DOS uses to obtain a disk directory for one disk after another until you finally locate the file you're looking for.

I use the labeling method myself, particularly on games and utilities disks, and I find it saves incredible amounts of time and spares me the frustration of being in the familiar situation, "I know it's on *one* of these disks, but *which* one?"

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION Strategically "cultivate" matching symbol-blocks, push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

Brand NEW *KE-SOFT* GAME Titles from *SI*

BOMBER JACK -- Superb battle of wits!
ASHIDO -- Ishido for your XL/XE
$10.50 ea. -- $9.50 for 2+ !

PLAYER'S DREAM 1 -- *PLOT* and *SKI RACE* (2 GAMES)
LEVEL DISK -- 35 New Levels for *TOBOT*, 50 for *SOGON*, & 100 for *CULTIVATION* !
$14.50 ea. -- $12.50 for 2+ !

This *SI* Informational Text page may be freely reproduced or excerpted in any media.

Backups and Hard Copy

Finally, you should always back up anything that is really important to some other media. If you have a hard drive, back up to floppies using HardBack or some similar utility. If you use floppies exclusively, you may want to use one of the many file/disk compression utilities, such as Disk Communicator, Disk Masher, the SpartaDOS SCOPY.COM utility or a similar program.

These utilities basically take an image of a full diskette side and save it to a file on another disk. Several of these disk images can be saved to one disk, providing you with a backup source for important data and/or programs. If anything happens to your working copy, you simply Un-Mash, Un-DiskComm, or whatever, putting the disk image back onto a full disk side, thus restoring your important material.

Hard copy is another valuable means of backing up data, and it is also a valuable means of helping to organize your software library.

Several disk library utilities exist which let you create a disk file and/or hard copy (printed out on paper) catalogue of your software collection. Hard drive users who back up to floppies and keep a hard copy of important data as well, will probably almost never lose data.

In Sum

A well organized collection of clearly labeled disks is a must for serious use of your Atari. Even if you just play games on your Atari, a good system for organizing your files will make it easier for you to enjoy your computer's capabilities by making it easy for you to find what you want, when you want to find it.

I hope everyone will gain something from the suggestions in this article, whether it's better productivity, more enjoyment from your computer system, or just a better understanding of how filename extensions can make things simpler for computer users.

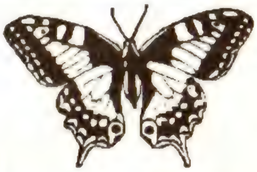
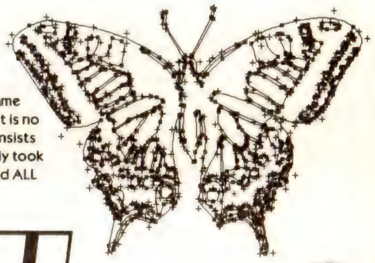
OakSprings Software

This small butterfly is unremarkable. The others are a new species you can breed on your Atari computer.



To the left is a pixel-based .IMG picture. In other words, the picture is made up of dots. It's a 58k file. The image can't be enlarged much more than this without the ragged edges showing. (In fact, they're showing already.)



To the right is a snapshot of the same image after it has been vectored. It is no longer made up of dots. It now consists of lines and bézier curves. This only took a few minutes and Avant Vector did ALL the work for you.

Automatic vectoring has arrived.

Avant Vector is a cutting-edge graphics tool that's fast, easy to use and surprisingly versatile.

The large butterfly wing on the right is a vector image created by Avant Vector. Using "automatic tracing," a bit image graphic (the smaller butterfly) was converted to a vector graphic, resulting in the smooth output you see here.

Vector graphics have big advantages over bit image graphics - they make much smaller files, and they can be scaled to any size without losing resolution or looking blocky. And Avant Vector's tracing routines are highly sophisticated; in a recent review of 7 Mac, PC, and ST auto-tracing programs, Avant Vector was rated best of the bunch! This means there's less editing after tracing an image, and you get more work done in a shorter time.

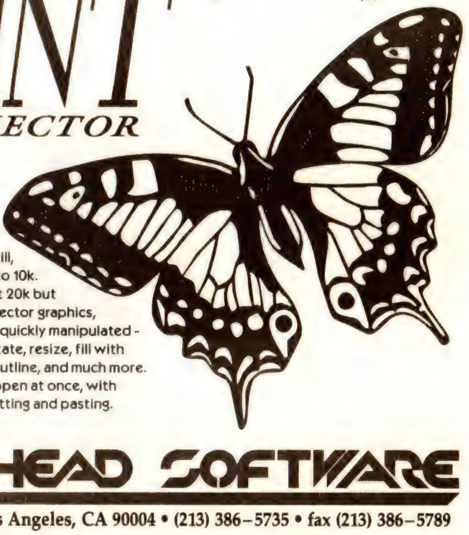
Avant Vector supports .PI3, .PC3, .IMG, .BLD, .PIC or .PAC formats. You can trace Mac, PC or Amiga graphics, in .TIF, .IMG or .IFF formats. The plotter version (Avant Plot) can also load and save HP plotter files.

No matter which DTP package you use, Avant Vector is a wonderful companion. It creates .CVG files for Outline, Calamus or Repro Studio. And .GEM files for use in programs that support GEM3 metafiles. Avant Plot allows EPS importing and exporting, and a full range of professional plotting, drawing and cutting options.

Since Avant Vector is a full featured vector graphics package, you can touch up any picture you've auto-traced, or draw pictures from scratch - with an intuitive, speedy interface you'll learn in a matter of minutes!

Call or write CodeHead Software for more information about Avant Vector (and its amazing cousin, Repro Studio). Special introductory pricing is available until December 31, 1991. Act now and save!

AVANT VECTOR



This is the .CVG vector version: it can now be enlarged or reduced at will, and the file size is down to 10k. The .GEM version is about 20k but otherwise identical. As vector graphics, the images are easily and quickly manipulated - you can stretch, skew, rotate, resize, fill with gray scale percentages, outline, and much more. Up to 7 windows can be open at once, with clipboard features for cutting and pasting.

CODEHEAD SOFTWARE

P.O. Box 74090 • Los Angeles, CA 90004 • (213) 386–5735 • fax (213) 386–5789

These are just a small sample of the EPS clip art drawings available from Computer Safari. These are from Volume 1 of the Clipables collection of over 600 EPS images.

Volume 1 contains images placed into several categories. Categories include: Animals, Business, Dingbats, Display Banners, Famous People, Holidays and Humor.

Clipables can be purchased from Computer Safari, 606 W. Cross, Woodland, CA, 95659 or phone (916) 666-1813.

MegaType is probably best know for their font conversion (FontVerter) and font creation (Font Designer) software.

The company is also an excellent source for superb quality fonts. Each MegaType Faces Font Pak will be a welcome addition to any DTPer's font collection.

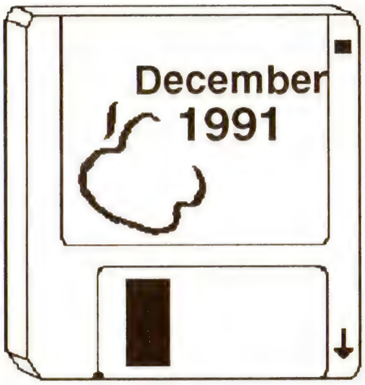
MegaType's Font Paks each contain Calamus, PageStream and Type 1 font formats on the same disk.

Fonts for Calamus are compatible with all versions up to and including 1.09N.

PageStream font versions include all files for compatibility with PageStream versions 1.8x or 2.1.

Adobe Type 1 format files come complete with font outlines, Adobe font metrics and metric files for Windows 3.0 with Type Manager (for use on an IBM with Windows or Corel Draw).

For more information or to order Faces Font Paks, contact MegaType, PO Box 645, South Bend, IN 46624, (219) 288–7468.



AIM Mac/Spectre Disk 🍎f the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting archives. Just double click to extract!

Here is a short description of the files contained on the December '91 Disk of the Month:

Acey-Ducey 1.01—A simple but fun card game in which you bet on whether or not your "down" card falls between to two "up" cards. BS Shareware's first Mac programming venture.

Alpha 4.01—Alpha is a powerful text editor particularly suited for program editing, but it can be used for any text editing/creation purposes. Alpha allows user-defined macros, user-defined external commands and a plethora of other handy text editing features.

AutoMenus 5.3—AutoMenus 5.3 is the latest and greatest version of this fantastic utility. AutoMenus can automatically pull your menus down as well as dismiss them.

Bart EPS—Two EPS graphics of Bart Simpson (that guy is everywhere!) for use with PICTuresque (elsewhere on this disk). Most DTP packages and some word processors can use EPS graphics. One of these graphics is a full figure drawing , while the other is the "classic" slingshot pose.

Conquest—A two to four player game in which the players attempt to gain control of a system of twenty planets through the use of force and strategy.

Escapade 1.3—Escapade is a control panel extension that allows you to use the keyboard to select buttons in dialog boxes. Shareware.

MF Menu+—MFMenu+ is an INIT that adds a MultiFinder Application Switching menu to the MF icon in the menu bar so you don't have to go to the bottom of the Apple menu on Macs not running System 7.

Mouse Odometer—Mouse Odometer is an application that, under MultiFinder, displays and continuously updates how far (in miles) you have moved your mouse. Includes an INIT that lets you use it without MultiFinder. Shareware.

PICTuresque—PICTuresque is a Desk Accessory that displays MacPaint, PICT and EPS graphics. It can also copy these formats to the clipboard as a PICT file. This is very handy for EPS-hostile word processors because all the EPS information in retained. Clean interface, good color support. Shareware by Tim Herzog.

ProWheel—A proportion (photo) wheel as a desk accessory! Available from within any application program like DTP and illustration programs. Versions for both Sys 7 and earlier are included. If you do a lot of graphics work. DTP or photographic resizing, this is a "must have." Shareware.

Text Mangler 1.2—Version 1.2 of the 'nonsense processor' which uses Markov chaining as described in Scientific American June 1989 and Jan. 1990. Input a text file and TextMangler will create new 'mangled' text based on a statistical analysis of the original. The results can be hilarious! Shareware.

TypeIt4Me 3.0—TypeIt4Me is a nifty INIT that essentially adds a glossary function to any and every program. You can even use it in modal dialog boxes. Just type in a 1 or 2 letter code and TypeIt4Me expands it up to a full paragraph! Great for writers! Requires System 4.1 or later.

Ultra 1.3—Ultra sorts plain text files (created on a Macintosh) by any position in the line. Great for sorting and resorting lists.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the Dec. '91 Mac/Spectre Disk and which format when ordering.

AIM

ST/Mega Disk of the Month

All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the Dec. '91 disk. For complete docs, see the text files contained in most of these archives.

ALICE.APP—ALICE, Another LIttle C Editor, comes to us from Ralf Kaufmann in Germany. This easy to use editor supports multiple GEM windows, search/replace, cut/paste and mouse editing functions. Source code is available from the author.

FLEABYTE.APP—This package consists of two primary desk accessories, along with GFA Basic source code and libraries. "Fleabyte\DT" is a calculator that can handle basic math, uncertainties in data derived from measurements, chemical equations and more. "The Wormhole" permits rapid calculation of columns or rows of numbers (including tabulated data) directly in a word processor's window! Now, you can turn your word processor into a simple spreadsheet. Versions of The Wormhole calibrated for 1ST Word Plus and WordUp are included, as well as a calibration accessory. Programs submitted to AIM by the author, Henry K. van Eyken of Quebec, Canada.

HAYAIDEM.APP—Demo of the Hayai file backup program from Machine Specific Software. Hayai is specifically designed for speedy backups from one hard drive/partition to another and is of special interest to SyQuest owners.

The remaining programs on this disk were all submitted to AIM by the author, Andy Osborne in the UK. Many of these programs deal with Astrology and horoscopes. For a detailed list of Andy's many other PD and Shareware programs, see the PD_LIST file on this disk.

CHINESE.APP—This program gives you your Chinese animal horoscope, based on the animal symbol under which you were born. Low resolution color only. Written in STOS Basic. Runs on STEs, Megas and STs—not TT or Mega/STE compatible.

DOMINOES.APP—Fortune telling program using standard dominoes. You choose three dominoes and your fortune is revealed. Low resolution color only. Written in STOS Basic. Runs on STEs, Megas and STs—not TT or Mega STE compatible.

FORECAST.APP—Astrology forecasting program. Gives detailed three month at a time long range astrology forecasts of your future. Runs in ST medium or high resolution on all machines, including Mega/STE and TT.

HARMONIC.APP—Calculates Astrological charts and their Harmonics. Extremely useful for Astrologers; baffling for anyone else...! Runs in ST medium or high resolution on all machines, including Mega/STE and TT.

HORO_ACC.APP—Desk accessory that generates horoscopes based on your date, place and time of birth, etc. Works in ST medium or high resolution on all machines.

I_CHING.APP—From six throws of three coins, an I Ching hexagram and associated reading are given. Low resolution color only. Written in STOS Basic. Runs on STEs, Megas and STs—not TT or Mega STE compatible.

NAMEDROP.APP—Expandable database of over 1000 first names and their meanings. Ever wonder what your first name means and where it originated? Chances are, your name is already in this database! Runs in ST medium or high resolution on all machines.

PD_LIST.APP—Listing of the many PD, Shareware and Licenseware programs available from Andy Osborne.

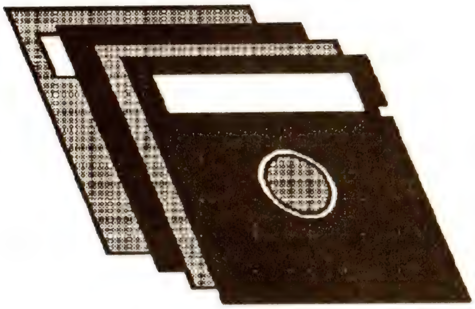
PLACES.APP—Expandable database of meanings of British placenames. Includes a 600-word dictionary of Anglo-Saxon, Gaelic, Norse and other elements, so any unknown towns can be tackled, with the meaning intelligently guessed at by the program.

RHYTHMS.APP—Based on your date of birth, this program calculates your Biorhythmic. Unlike most other Biorhythms programs, not only a graph is output, but also a chart and actual textual interpretation. Some compatability analysis is also included. This demo is limited to years up to and including 1991.

SETUP.APP—A small program that sits in the AUTO folder and reads the system date at boot up. If the date is less than 1-1-1991, another small Time/Date set program is executed.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the December '91 ST disk when ordering.

AIM
8-bit Disk of the Month
December 1991



Side 1 of the December '91 AIM 8-bit Disk of the Month was produced exclusively for ATARI Interface Magazine by *Software Infinity* and the Nittany ATARI Personal Computer Organization of State College, Pennsylvania.

Boot this side of the disk with BASIC to use the file loader/text viewer. Boot without BASIC to go directly to DOS.

NOTE: You cannot use the file loader to use the ARC files on this disk. You must unARC these files to another diskette using Super UnARC from Bob Puff. Super UnARC appeared on the April/May '91 AIM 8-bit Disk of the Month.

This side contains:

MENUPIC.BAS—Autoloads the SILOGO.PIC upon bootup.

SILOGO.PIC—The SOFTWARE INFINITY Picture-Logo, which autoruns MENU.

MENU— SI's custom MENU. Loads Binary and BASIC files, plus reads Documentation and Text files with onscreen prompts.

TIDIER3.ARC—TEXT TIDIER Version 3.2, by Greg Maguire of NAPCO. Strips word-processor editing commands from your downloaded or uploadable (AT)ASCII text files and much, much more—in record time!

KESDEM2B.ARC—Public Domain demos of four of KE-SOFT's NEW GAMES for the ATARI XL/XE—will whet your appetite for the Commercial versions! UnARC this file to a blank formatted disk!

TECHNO NINJA and **OBLITROID**—Six screen "snapshots," three from each game. Just sit back and enjoy these two "slide shows."

CULTIVATION demo—Use your joystick and trigger (hold down) to select and pull each block one at a time.

ZEBU-LAND Teaser—Utilize joystick and trigger to choose and move each brother separately, in turn.

Remember to briefly hold down the OPTION key on your XL/XE as you boot the UnARChived KE-SOFT DEMOS Disk you've created.

Consult *Software Infinity's* Advertisement in current or recent issues of AIM for additional background info on these four KE-SOFT GAMES.

Side 2 of the December '91 AIM 8-bit Disk of the Month contains:

AMIGAPIC.ARC—Demo of the capabilities of EscalPaint for the XL/XE. EscalPaint is a paint program that uses 256 colors out of 25456, supports joystick, KoalaPad, etc. and lots more. This ARC contains five sample EscalPaint pictures converted from the Amiga. UnARC to an empty floppy (this fills an entire SD disk!). Once unARCed, turn off your computer and reboot to start the demo. Press SELECT to move from picture to picture.

CARGOSHP.ARC—Jack's Cargoship is a Battleship type game in which you must sink the competition's fleet of ships carrying/protecting a DRAM shipment. Play against a friend or the computer, or let the computer play against itself! Features day, evening and night play. Written by Paul Alhart of the Atari Federation club and author of AIM's A-T-A-R-I columns. SAVEd BASIC, docs included.

DB20X.ARC—An external doors/outboard command file to add an online database to AtariLink BBS 2.0x. AtariLink was featured on the November '91 8-bit Disk.

SEARCHII.ARC—A flexible general purpose data base program that's very easy to use. Supports variable length records/fields, and several machine language subroutines provide quick search capabilities. SAVEd BASIC. Written by Paul Alhart.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the December '91 8-bit disk when ordering.

AAAUA ATARI 8-BIT USER GROUP

Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

The Alamo Area Atari User Association (AAAUA) is an Atari 8-bit user group serving primarily the greater San Antonio area. General Membership meetings are held on the first Tuesday of each month at the Balcones Heights Community Center, 107 Glenarm, San Antonio, from 6:30 to 9:30 PM. Each third meeting we have a swap meet and computer workshop in lieu of the informal presentation. AAAUA maintains a Library of about 700 disk titles. Each month we publish (FR)ANTIC covering happenings of local interest as well as other topics, both technical and non-technical. Members also receive a subscription to AIM as part of their member benefits. Dues for family membership are $24 per year or $15 for six months. Dues for Subscribing membership are $15 per year domestic and $18 per year for most foreign countries. For further information write AAAUA at the above address or call Al Sherrill, President, at (512) 492-6633, or Thelma Sunvison, Executive Assistant, at (512) 344-3522.

AACE

ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

President Richard M. Houser (505) 299-3977

General membership AACE members meet twice monthly, on the first Saturday and third Tuesday of each month. An 8bit meeting is held on the second Tuesday of each month. On the first Saturday of June and December, a Swap Meet is held. Dues are $20 a year payable in January. Members receive an AIM subscription, access to our 16bit and 8bit PD library and membership in the ASTRO BBS (505) 260-0448 Club membership is at an all-time high of 36.

The Atari Clubs of Denver is an umbrella group consisting of: Atari Club of Denver, Starfleet User Group and the ST Interest Group. Atari Club of Denver meets the first Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7:00 PM. Starfleet User Group meets the second Friday of each month. We meet at Pamona High School 8101 West Pamona Drive in Arvada, Colorado. The meeting starts at 7:00 PM.

Atari Club and Starfleet provide support for Atari 8-bit owners.

ST Interest Group meets the third Tuesday of each month. We meet at the Aurora Public Library 14949 E. Alameda Avenue in Aurora, Colorado. The meeting starts at 7PM. The ST Interest Group provides support for the entire ST computer line.

Our address is: Atari Clubs of Denver POBox 24064 Denver, CO 80224. For additional information call our BBS at (303) 343-2956, 24 hours, 300-2400 BPS.

ACCEPT

Atari Computer Club of El Paso, Texas

Membership to ACCEPT is $20 a year. A membership in ACCEPT will get you the magazine your holding for an entire year, discounts at Jenkins' Computers and on various ST publications. Technical help, and access to one of the largest PD libraries in the US are also thrown in for good measure. Special access to the STE-EP BBS, an ACCEPT members BBS is also a privilege of membership. Make checks payable to: ACCEPT, 245 Longhorn Crt, El Paso, TX 79907.

BBS support for ACCEPT: STEP El Paso: 915-755-STEP STE-EP BBS El Paso: 915-821-9220

ACCESS

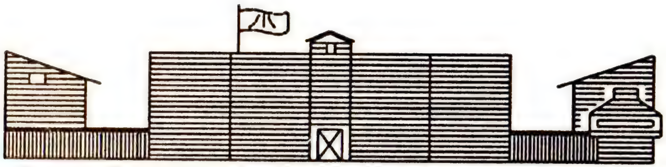
Atari Computer Club

Encompassing Suburban Sacramento

Bob Drews (916) 423-1573 President

ACCESS — The Atari Computer Club Encompassing Suburban Sacramento. As usual, please call any officer if you need information, directions or even to make a suggestion. Or, you can call the ACCESS BBS at (916) 428-8662. Address: PO Box 1354, Sacramento, CA 95812

Our general meeting is at 7:30 PM on the first Wednesday of each month in Classroom B of the SMUD training building at 1708 59th St, between Folsom Blvd and R Street, just off Highway 50. This is our main get-together.



Atari Computer Owners Resource Network
Fort Wayne, Indiana

ACORN, the Fort Wayne area Atari users group, meets at the Georgetown branch of the Allen County Public Library on the first Saturday of each month beginning on at 10 AM. Annual membership dues are $18. Call our BBS at (219) 744-1396 for more information or write to us at ACORN c/o Ken Helms, 3627 Iowa Court, Fort Wayne, IN 46815.

ACORN
Atari Computer Owners of Rochester New York

The Atari Computer Owners of Rochester, NY (ACORN) meets on the 2nd Wednesday of each month at Brighton High School, 1150 Winton Road South. An ST Beginner's class starts at 6:45, while our 8-bit 'Basically Speaking' class starts at 7:00. Our general meeting starts at 7:30pm in room 262S, with a split into ST and 8-bit SIGs at 9pm.

We operate the Dimension's End BBS at (716)436-3078, 300/1200/2400 baud, 40 MB of online PD and shareware files. Membership in ACORN is not required to access the system.

Membership in ACORN is $18 per year, and entitles you to a year's subscription to both the ACORN Kernel newsletter and the Atari Interface Magazine, 12 meetings, access to our 8-bit and ST PD libraries at reduced cost, and special access to our BBS. Our mailing address is: PO Box 24920, Rochester, NY 14624.

President Don Allis (716)293-3415

ACUNET

Atari Computer Users Network

Salem, Oregon

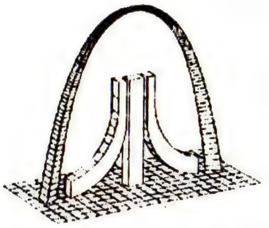
ACUNet is the Atari Computer Users Network in Salem, Oregon. Annual dues are $15 with an AIM subscription and $10 without. Our meetings are held the fourth Tuesday of the month at 7:00 p.m. Call Ron Purdy, ST Co-Chair at (503) 588-7509 for the current meeting location and other information.

Local BBS support includes the Atari SIG on the Salem Public Library BBS - (503) 588-6130, Page BBS - (503) 363-0171, and The Jungle BBS - (503) 393-4274. Want more information about ACUNet? Write to Ron Purdy, 2662 East Nob Hill Drive SE, Salem, OR 97302.

ATARI FEDERATION

Regular meetings are held at the VAFB Federal Credit Union, Vandenberg Village, Califorina on the first Monday of every month at 7:00 P.M. Dues are $10 for individual or $15 for family membership. The Atari Federation maintains a PD software library for both 8-bit and ST computers.

President Phil Rominger



ACE of St. Louis, PO Box 3508, St. Louis, MO 63143, phone (314) 644-7168.

President Dick Pederson

Bay Area Atari Users Group, PO Box 4637, Santa Clara, CA 95054

COOKEVILLE ATARI COMPUTER ENTHUSIASTS
Cookeville, Tennessee

Cookeville Atari Computer Enthusiasts—c/o Robert Pecora—280 Capshaw Drive—Cookeville, TN 38501—Cookeville A.C.E. meets on the first Saturday of the month at 1:00 p.m. at the Putnam County Library in Cookeville, Tennessee.—Cookeville A.C.E. caters to Atari ST and 8-bit computers and is supported locally by The Generic BBS, Terry Rapp - Sysop.—C.A.C.E.

President Dan Hale (615) 526-8002

CDACC
CENTRAL DELAWARE ATARI COMPUTER CLUB

Sec/Treas Tom Baldwin 302-678-9411

Central Connecticut Computer Club

Meetings of the CCCC are on the third Wednesday of each month. The meets kick off at 7:30 and usually include presentations or demos of various hardware or software items. The meetings are held at 127 Pinnacle Rd., Bristol, Ct. 06010

Prospective members may call Rich Scheidel (203)589-3738 or call Gary Jones (203)225-4611, or write, CCCC, 127 Pinnacle Rd., Bristol,Ct. 06010.

Dues are $25 per year,$30 for families. Includes Voting membership, Atari Interface magazine, access to Club library (8-bit and ST) and access to the Club magazine library.

CDACE
Capital District ATARI Computer Enthusiasts

The Capital District Atari Computer Enthusiasts was founded in 1981, is located in Albany, N.Y. and serves Albany, Schenectady, Rensselaer, Saratoga and surrounding counties in upstate New York. XL/XE meetings are currently held four times a year on a quarterly basis and ST meetings on the last Wednesday of the month. CDACE meetings are held at the Computer Cellar, located in Westgate Plaza, Albany, N.Y.

The club has extensive public domain libraries for both computers which are available to members beginning at 6:30 PM on meeting nights. ST disks are priced at $2 while the XE library continues to remain free to all members.

Dues are currently $20 per year for each family. This includes a subscription to AIM magazine, full access to the club BBS, and our monthly newsletter.

President Bob Thompson 518-439-5356

C.O.A.C.
Central Oregon Atari Club
Dedicated to Central Oregon Atari Users and Enthusiasts Since 1986

President Bob Stiles (503)389-5206
Address: P.O. BOX 6824, BEND, OR 97708

Our membership dues are $20/Yr for new members, $17/Yr for renewals. $1/Yr for each additional family member. We meet the FIRST SATURDAY of the month at 5:00 PM at the Ann Rita Conference Center, which lies just in front of the St. Charles Hospital on Neff Rd.

CRAG Calumet Region Atari Group

CRAG—Calumet Region Atari Group, PO Box 10995 Merrillville, IN 46411, is a club for users of the Atari ST, STE, and Mega ST computers. CRAG meets on the second Wednesday of every month at Broadway Music, which is located in Greentree Plaza, at 1509 W 81st (US 30), Merrillville, IN. Meetings begin at 7PM.

Membership in GRAG is open to anyone. Dues are $15 a year and entitle you to a subscription to Atari Interface magazine, as well as discounted prices on CRAG's Public Domain/Shareware library disks. Library disks are double sided. Cost per dis is $2.50 for members, $4 for non-members. For more information call:
Jeff Coe (219) 663-5117

CUSTUG Champaign-Urbana ST Users Group

The Champaign-Urbana ST Users Group (CUSTUG) meets at 7pm on the second Wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race in Urbana, IL. Membership dues include a subscription to AIM and GLITCH and use of the commercial lending library. New members are welcome. The group supports a local BBS, Blackhawk's Keep, operating 24 hours a day at 3/12/2400 baud (1/8/N): 217-892-5512.

Henry Murphy President
CUSTUG PO BOX 3442 Champaign, IL 61826-3442

Cuyahoga Valley Atari Computer Club
C.V.A.C.C.
ATARI®

The Cuyahoga Valley Atari Computer Club (C.V.A.C.C.), P.O. Box 9173, Akron, OH 44305-0173

Dues are $20.00 per year and will entitle members to all club benefits and activities. Each membership includes our monthly newsletter, The Password, as well as a subscription to Atari Interface Magazine. Members also receive a membership card which, when displayed at participating local computer stores, will entitle its bearer to discounted prices.

Meetings are held on the second and fourth Tuesdays of each month at 7:30pm in the basement of the First National Bank in Mogadore, Ohio.

President Don Crano (216) 376-7618

Eastside Atari Users Group

The Eastside Atari User Group, (EAUG), meets on the first Monday of every month, 7PM, at the Alton Square Mall Community Room, in Alton Il. All meetings are open to the public. No club dues. PD library, club newsletter EAUG-Log, newsletter membership $18 per year. Member of the Midwest Atari Regional Council, MARC.

Eastside BBS 618-254-6077 and Garage BBS 618-344-8466. EAUG's address is 2425 Crislisa Dr, Alton, Il. Call 618-465-0342 for EAUG information.

FACCS

We hold our meetings the second Thursday of each month, at Eager Beaver Computers, located next to the Garland Theater. Meetings start 7PM. All visitors are welcome, so come check us out.

With the $15 per year family membership, you will receive our club's newsletter (AIM) as well as access to our PD library. Since we currently have renewal dates scattered throughout the year, please check your card for your expiration date. To prevent any interruption in services please renew by the expiration date on your card. For more information contact any of the officers or write to FACCS, PO Box 5121, Spokane, Wa. 99205

President's Message

President Jeff Yoe (913) 682-2883

FRACUS
Fresno Regional Atari Computer User Support

President Tom Hancock (209) 885-2817

The FRACUS user group meets the last Saturday each month, at 6PM, at the Four Seasons Moble Home Park Rec. room in Fresno, CA. We have a large public domain library with over 400 programs. The club also has a 24hour BBS. All 8bit Atari users are welcome to our meetings and to use our BBS (members have an additional sig on the BBS). Dues are currently $20 annually or $5 quarterly which includes a subscription to AIM and issues of our periodically published newsletter.

GRASS

GRAND
RAPIDS
ATARI
SYSTEMS
SUPPORTERS

GRASS meets the first Wednesday of every month at the Wyoming Public Library, 3350 Michael S.W.. Doors open at 6:30, meeting starts at 7:00pm. Dues are $22.00/yr. including AIM. Bring in one PD software disk and get 2 blank disks for your time.

Tim Feenstra President (616)249-9742

G.T.A.U.G.

The Newsletter of the Golden Triangle Atarian

Meetings are held the first Tuesday of each month at a location announced in the previous meeting.

At present our dues are $24 per year (Our year begins in September.) and is pro-rated at $2 per month for new members the first year. We support all facets of Atari computing from 8-bit to Spectre/Mac to IBM and MIDI.

President Carl Neblett (409)755-6535
BBS Number (409)722-6526

HACE

The Houston Atari Computer Enthusiasts meet on the fourth Wednesday of the month, 6:45pm at the Health Economics Corporation, 2400 West Loop South, in Houston, Texas. The club supports all Atari computers from the 400 to the Mega4.

Membership is $22 per year, and gives full access to our BBS (713) 458-9923, access to our disk, magazine and newsletter libraries, a subscription to AIM, and our local news journal UPDATE ATARI. There are also other benefits, such as store discounts, door prizes, workshops, telephone help when you have problems, and much more! For more information, please contact one of our officers or drop us a line!

STUN's BBS "The Bolt"		(801)968-3921

Make your Atari FAST!

WARP 16 FAST!

The WARP 16 accelerator + cache board contains a high speed 68000 CPU that replaces the slower 68000 CPU currently used in your Atari.

By taking advantage of the large amount of high speed cache ram on the WARP 16 board this CPU is able to run programs at twice the speed of an unmodified Atari.

Routine tasks such as spellchecking, spreadsheet calculations, screen redrawing, and laser printing take a fraction of the time they used to.

No longer are you frustrated by waiting for your computer.

WARP 16's custom logic allows caching of both reads and writes AND caching of both "byte" and "word" memory accesses.

What does all this mean?

Your Atari moves FAST! WARP 16 FAST!

Features:
- 16MHz CPU accelerator with cache for all Atari ST/MEGA computers.
- 80K of high speed static ram. Organized as 16K cache-tag ram + 64K cache ram.
- FOUR TIMES MORE cache ram than any other Atari accelerator on the market.
- User selectable "stock ST" mode gives 100% compatibility with ALL Atari software. Even Spectrum 512.
- For use with Atari ST, MEGA, and STACY computers.
- STE version available soon.
- Don't settle for other upgrades that offer tiny amounts of cache ram, or offer compatibility with 80% of existing software.
- WARP 16 offers a full 64K cache + 100 percent software compatibility.
- Dealer inquiries welcome.
- Order your WARP 16 TODAY!

WARP 16 $349.95 (U.S.)

Add $4.50 for shipping and handling. Note: WARP 16 requires installation by a qualified computer technician. This installation may be done at your local computer repair shop. Call us for details.

Make all cheques payable to:

The GP_EDIT LIBRARY
for use with GFA BASIC 3.0 or higher

DSA
5601 Ammons
Haltom City, TX 76117
(817) 485-9293 (12:00-5:00pm)

The GP_EDIT LIBRARY allows even novice programmers to get the same results as the professionals do but without the months (or years) of reserach and development time. For game designers the GP_EDIT LIBRARY has proved to be an invaluable tool. Several developers are using the GP_EDIT LIBRARY to create their next commerical program. Call and ask about our GP_EDIT LIBRARY programming contest!

Character graphics - Use the GP_FONT EDITOR to design character fonts in any resolution. Simple to use in your own programs. The library handles everything for you. Peek the screen to find out what character is there. What character is the mouse pointing at? TEXT, PLOT, DRAW, CENTER, CRAWL, etc. SO MUCH MORE!
Room design- How does that game have level after level? They use character graphics! Design rooms with the GP_MAP EDITOR with fonts created with the GP_FONT EDITOR. Loading and displaying these rooms is totally automatic and requires no overhead by the programmer. It's all handled by the GP_EDIT LIBRARY.
Picture loading - Degas .PI?, .PC?, .NEO, .TNY, Spectrum 512, .BLK
Picture saving - Degas .PI?, .NEO
Screen Handling - Manipulate multiple 32k screens each with their own palette information. Copy, unseen by the user. Display these screens using one of 25 different video display styles. This adds video flash to your programs.
Page Flipping- Flicker free graphics with easy page flipping/ sprite routines.
Digitized sound - Play ST-REPLAY files in the background without stopping program execution. Video graphics and digitized sound at the same time!
Sound effects - A library of sound effects you use by calling their procedure name. Also a small library of game sounds that work in the background.
Mouse defintions - A library of useful mouse images that you select by calling just one procedure. Images for CUT, PASTE, TEXT, TARGET, etc.
The GP_EDIT LIBRARY includes the GP_FONT EDITOR, GP_MAP EDITOR, the complete library, several demo programs with source on disk and manual.
Now available at your favorite ATARI ST DEALER! $49.95 Suggested retail price.

"I was able to make a graphics displayer with tons of features within one hour of opening the GP_EDIT LIBRARY." CB, IL.

"I kid you not, I had multi colored fonts, screen fades, digitized music, smooth animation, in a demo program I wrote the same night I bought the GP_EDIT LIBRARY." KH, TX.

"The MAP features are great. I've decided to write that adventure game I had always wanted to. Complete with colored fonts and digitized sound ofcourse." DM, OH.

You'll be able to have similar results!

See the GP_EDIT LIBRARY in action!
Ask for the GP_EDIT LIBRARY demo disk from your ST dealer. (Or call us...)

Now playing on your local BBS or at your favorite PD supplier, the GP_EDIT LIBRARY demo games! Ask for **BATTLE SPACE**, **MS PAC**, **BOBBLE**, all designed with the GP_EDIT LIBRARY.

Silhouette

Bit-Image & Vector Graphics Drawing Program with Auto-tracing

Now with Postscript output, advanced auto-tracing and full Documentation!

Now Shipping!
Version 1.25
$94.95

Load DEGAS, IMG, MacPaint and TINY bit-images and GEM metafiles. Output IMG bit-images files and DXF (CAD format), GEM or Postscript EPS vector graphics files. Output compatible with Pagestream, Calamus, DynaCadd and Adobe Illustrator.

Drawing tools include: lines, polylines, b-splines, beziers, circles, ellipses, arcs, polygons/stars (to 99sides), spirals, parabolas, flood-fill, spray can and eraser.

Auto-trace bit-images into vector graphics. Follows image contours inside and out. Eliminates excess points and uses b-splines or bezier smoothing.

Editing Tools include: editing polyline points(add, delete pts. and scroll the mouse ptr. along the p-line), rotate, mirror, flip, reshape (stretch, size, skew, trapezoidal skew, free corner warp), and duplication with rotation, enlargement along a line or polyline or by input coordinates.

Two bit-image clip buffers, separate copy and cut vector buffers, Quick keys speed progress. Pixel editor window. Magnify objects up to 16 times (reaching 3200 DPI).

Grid and ruler system with snapping to grid, object geometric pts. or independently set snap points.

Silhouette V1.25 runs on all ST & TTs in ST high resolution, on big screen monitors (e.g. Moniterm) and requires just 1 Mbyte of RAM.

This is Word Writer running under MultiGEM...

"It's like MultiFinder* for GEM**"

Many of our customers feel this way after using MultiGEM. A true multitasking system for the Atari ST, STE and TT computers. Run up to six GEM, TOS, ACC or TTP programs all at the same time. TOS and TTP programs run in their own GEM windows. Run accessories right from the "Desk Top". Adjust and allocate memory to any program running under MultiGEM. MultiGEM is completely compatible with most Atari programs. Imagine downloading files with your telecomm. program, printing out a document with your word processor and working with a DTP program all at the same time. It is possible using MultiGEM! MultiGEM is a TRUE multitasking "OS" that is flexible and easy to use. *Works great with CPU accelerators like Fast Technology's T-20.*

Only $99.95

MultiGEM Utilities Disk #1

The MultiGEM Utilities were designed to enhance MultiGEM's performance. There are four programs included in the MultiGEM Utilities Disk #1. MuliMAT will allow you multask format a floppy disk. With Multi-Copy you can multitask copy files. Multi-Print will let you multitask print ASCII text files. Multi-Launch is a complet program launching system that will allow you to run other programs from within any GEM program. These utilities are a must for MultiGEM users.

Menu Plus is a full featured "Desk Top" enhancement that allows you to quickly launch (run) any program on your hard disk or floppy disk. Menu Plus uses a creative menuing system that allows you to set up a Main Menu with corresponding Sub-Menus, quick access to over 160 programs, access to the File selector and the ability to launch programs directly from it. View Degas, NEO and Spectrum 512 pictures. Show or print a text file. Play and edit ST-Replay sound files. System settings like screen colors, Blitter Chip and Time and Date can all be set and saved from Menu Plus. Menu Plus includeds a special password feature. All of this and Menu Plus only uses 32k when running a program. ACC version of Sound, Text, and Graphic features included.

DTPaint *#1 Image Editor*

DTPaint is a full function high resolution paint program in a **"Desk Accessory"**. Because DTPaint is a desk accessory it can be used to edit IMG, DEGAS and MacPaint within your favorite Desk Top Publishing package. DTPaint supports GDOS, GPLUS. Included is a full array of tools and has "MAC" like features such as **"Lasso"** and **"Jack Knife"**. Works with Atari^ ST, STE and TT computers.

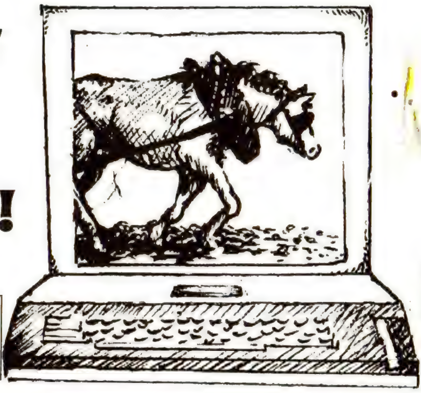
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

Power Products for your 1050 drive

$69.95 THE SUPER ARCHIVER $69.95

The Super Archiver is more than just another double density high speed upgrade for your 1050 drive. Rather it is the most powerful **copying and disk editing** 8-bit tool available! Copies are **exact duplicates** of the originals: no patches or PDB files needed. Installation consists of a plug-in module and six simple solder connections. Software included. Only $69.95 + $5 S/H/I. Features include:

- TRUE DOUBLE DENSITY
- ULTRA SPEED read/write
- FULLY AUTOMATIC COPYING
- EXTRA MEMORY SUPPORT
- SCREEN DUMP to printer
- HEX/DECIMAL DISPLAY
- SECTOR or TRACK TRACING
- DISPLAYS HIDDEN PROTECTION
- AUTOMATIC/PROGRAMMABLE
- PHANTOM SECTOR MAKER
- ARCHIVER/HAPPY ARCHIVER COMPATIBLE
- BUILT-IN EDITOR reads/writes/formats up to 35 sectors/track
- CUSTOM FORMAT tracks up to 40 sectors
- BUILT-IN DISASSEMBLER
- TRACK MAPPER displays up to 42 sectors
- ADJUSTABLE/CUSTOM SKEWING
- AUTOMATIC SPEED COMPENSATION

$99.95 THE SUPER ARCHIVER II $99.95

The **SUPER ARCHIVER II** edits and copies all **ENHANCED DENSITY** programs plus retains all the features of our **SUPER ARCHIVER!** (see above.) This allows you to **COPY** or **CREATE** single or ENHANCED DENSITY protection schemes (including **PHANTOM SECTORS!**). Completely automatic and compatible with the **SUPER ARCHIVER I**; a truly **POWERFUL BACKUP/PROGRAMMING** device! Only $99.95 + $5 S/H/I. ***NOTICE!*** If you already own a **SUPER ARCHIVER**, you can upgrade to a ***SUPER ARCHIVER II*** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$79.95 THE BIT-WRITER $79.95

The Super Archiver **BIT-WRITER** is capable of duplicating the 'uncopyable' EA and SYN series which employ 34 FULL sectors/track. It performs its feat by re-assembling the track into bits, then writing it all back out. Simple installation: **PLUG-IN** circuit board and four solder connections. The **SUPER ARCHIVER** with the **BIT-WRITER** is the ultimate backup tool for the 1050 drive. **EXACT DUPLICATES** of originals are made. Must be used with the **SUPER ARCHIVER**. Only $79.95 plus $5 S/H/I.

>> FALL SPECIAL! << Order the ***SUPER ARCHIVER*** and ***BIT-WRITER*** combination for only **$149.95** plus $5 S/H/I!

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

***>> Fall special** price - **$59.95**! <<*

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks tö your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Computer Software Services
P.O. Box 17660
Rochester, NY 14617

CompuServe puts the whole world at your fingertips.

When you connect your computer to CompuServe, you join the world's largest international network of people with personal computers. You have access to more than a thousand services that offer a source of support, information, entertainment, communications, and benefits of all kinds.

A world of advantages.

CompuServe lets you take advantage of your personal computer in a thousand different ways.

For instance: communication. You'll get invaluable personal computer software and hardware support from other CompuServe members, as well as product manufacturers, all over the world. Meet in special interest forums to discuss everything from science fiction to sharing software. And keep in touch through electronic mail and faxes, as well as by "talking" over 72 CB Simulator channels.

CompuServe also lets you shop coast-to-coast at hundreds of nationally known stores and take advantage of a world-class reference database. It gives you access to the latest national and international news. And our special financial files offer complete statistics on over 10,000 NYSE, AMEX, and OTC securities. You can even trade online with local discount brokers.

Global travel and world-class fun.

CompuServe also offers airline schedules, so you can check out the bargains and book your own flights on almost any airline worldwide. You can get travel news, frequent flier information, and country and travel facts. As well as listings from over 30,000 hotels.

Plus, there are games. Sports, trivia, educational, space fantasy… you can go it alone or compete against players from all over the world. Only on CompuServe can you test your wits in the only online TV-style game show with real prizes, or leave the earth entirely in one of our interactive space adventures.

Just give us a call.

To become a CompuServe member, you need a computer and a modem. We'll send you everything else, including a $25.00 usage credit with your Membership Kit. In most places, you'll be able to go online with a local phone call.

To buy a CompuServe Membership Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call us today.

And put the whole world at *your* fingertips.

ATARI INTERFACE

Your Connection to the Atari Users Community

Publishers
William Rayl / Patricia Snyder-Rayl

Managing Editor — Patricia Snyder-Rayl
Editor — Bill Rayl
Contributing Editors
Ed Hall, Dave Plotkin

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, Mi 48108.

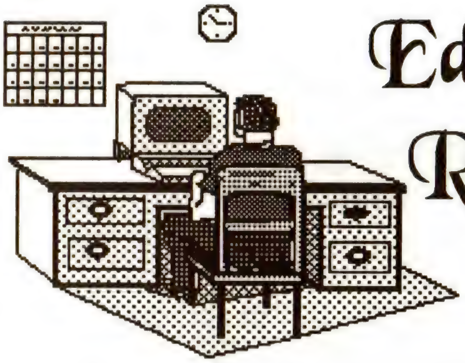
Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.



Editorial Ramblings

Happy New Year!

Our hopes go out to everyone for a pleasant and prosperous New Year. We hope the holiday season was a safe and happy one. Thank you to everyone who's supported AIM over the past year.

The end of one year and the start of another would be a good time to send in that Shareware contribution to your favorite Shareware author(s). Remember, supporting them supports your Atari computer. Your hardware investment is worthless without software to run on it. Shareware authors ask for payments of only fractions of what this software would cost if marketed commercially.

Because of an overwhelming amount of submissions for this issue (and a lack of time because of the Chicago Show), we've postponed for an issue or two reviews of several DTP-related packages. Look for our report on the Chicago ComputerFest by Atari in the February issue along with reviews of several Gribnif packages.

The Chicago Show was the last Atari show for the year, but there are rumors of a show in the spring in Toronto, Ontario, Canada. The turnout at Chicago was very good—about 2,400. LCACE's Mike Brown and Atari's Bob Brodie and Bill Rehbock did an excellent job with this show. Hopefully, the fine job done by Atari and LCACE will encourage more combined efforts in the future.

With the start of a new year, many readers' subscriptions may be expiring. Please check your mailing label. If there is a two or three on it, you're about to expire. Remember that the post office doesn't automatically forward third class mail. This means, if you move, the post office will throw your issues away unless you fill out a form saying you'll pay to have your 3rd class mail forwarded *or* you notify us *before* the next issue gets sent to you. We can't be responsible for missed issues due to a change of address.

Bill & Pattie Rayl

From The Reader's Viewpoint

Dear Editors,

There are a couple of fascinating articles in the November AIM. One was Chuck Steinman's proposed new 8-bit motherboards. He makes them sound darn good.

It might have helped if he had included some parameters to the numbers included in his comparison table on page 27. Looking at it as is, I instinctively drew the conclusion that whatever a 65816 was, the 68000 was four times better because the 65816 rated only a 2 on some test while the 68000 rated an 8. If he'd mentioned these numbers were units of time, then I would have read the chart correctly. It does amaze me that an 8-bit chip might run faster than a 16-bit chip.

It's surprising in this day and age to see someone involved with a homebrew computer. There are so many ready-to-run boxes around, it hardly seems worth the bother to design, the cost to build or all the software to write. I have heard of one other homebrew computer. It's in Australia. It's called the Appliz, based on the 68000 chip.

I have no idea what that computer is like—certainly short on software. But, it does make me wonder what could be done differently to the ST to make it an optimized 68000 platform.

Looking at the STEs and Mega/STEs that Atari has introduced in the past year, I'm struck more by how little has been changed to those machines.

A switch to SIMMs and improved color and sound doesn't really amount to much. The Mega/STE with 16 MHz clock and built-in LAN port is more of an improvement.

What Atari really needs is a redesign of ther MMU to break through the current 4Meg limit on RAM. In today's world of high-end applications, 4 megs is nothing. Even the TT's 8Meg of RAM is not much when one is working on video or computer graphics or animations.

An MMU that would allow the 68000 to address all the memory locations possibly combined with a switch to faster 16 or 20 MHz CPUs would allow Atari to bring to market a machine big enough for today's business needs while using the more affordable 68000 chip. A 16Meg ST with 20 MHz chip and TOS 2.0x—now *that* would have made for an Enhanced ST!

The other interesting article was David Plotkin's, where he mentions that the developers of the Video Toaster have taken to packaging their product with an Amiga in a case without the Amiga logo.

It's sad that even Amiga suffers the Brand Name resistance problem Atari does. Though, curiously, I get a smug feeling about this. For all Amiga's apparent distancing of Atari as the alternative-alternative computer, they're still in the same hole as Atari.

But this brings to mind something I saw once for the Amiga—a box that sort of engulfed their bottom line model 500 and converted it to an Amiga 2000. I'm not at all sure what was in that box, but undoubtedly it included a hard drive, maybe a second floppy drive and an expansion port for the IBM emulator.

I can see where are Mega converted box for the ST would be pretty handy too. Dave Small's MegaTalk board apparently won't fit inside an ST, nor will his SST replacement motherboard. And, there are a lot of new video cards out, but the ST has no expansion slot for them.

A case that could combine a hard drive, possibly a second floppy and six or eight expansion slots—say four PC, two VME and two Mega standard—would clear away the clutter of external drives, external modems and external PC emulators. This would be a boon to those of us who don't have a lot of desk space to begin with, but also would grant the ST the kind of flexibility and expandability it needs if it wants to avoid joining the Sinclair in your closet of useless computers.

Regards,
Brian Earl Brown
Detroit, MI

[Editors: The numbers presented by Chuck Stienman for the 65816/68000 comparison were actually clock cycles, which can be referred to as "units of time" for simplicity. The 65816 is actually an 8MHz 16-Bit chip that has a 6502-compatible mode.

As for memory, Atari currently has a 16Meg TT RAM upgrade board, and GESoft sells TT RAM boards allowing up to 42 Megs of addressable ST and TT RAM. The TT is definately not limited to 8Megs.

Finally, on the subject of new cases, there are already a number of options available. Tech-Specialities of Houston, TX sells a tower case designed to hold both an ST and IBM motherboard, with peripheral sharing possible.

For more details, please see the Tech-Specialities ad located in this issue, or call them at (713) 691-7009. Tech-Specialities has a very extensive product catalog. This may be requested by writing 909 W. Crosstimbers St, Houston, TX 77022.

A company in the UK called The Atari Workshop had a tower case available for the ST as long as a year ago. Called the Tower Power, this case could hold an ST motherboard, up to three floppy or hard drives and more. The Atari Workshop, Units 2&19, Sumner Workshops, Sumner Rd, London, SE15 6LA, 071-708-5755.]

ATARI BULLETIN BOARD

Lots of news to cover this month, and on a tight schedule, too! The Chicago Computerfest by Atari has just ended with a respectable attendance figure of 2,300. There was a lot to see at the show. Look for a full show report next issue.

Atari's presence at the show was spectacular. Bob Brodie and Bill Rehbock, along with the 20+ other employees from Atari US and Canada, should be highly commended for their efforts. (We'll try to get all their names into the show report!)

This month's Bulletin Board will focus on the new product announcements/shipments from Atari Corp. There just isn't enough time to detail all the news from developers, so we'll have to save that for next issue.

STe Bundles!

Just in time for the holiday season, Atari has released a couple of system packages. The Discovery Xtra bundle includes a 520STe; SC1224 color monitor; a "Starter Pack" consisting of NeoChrome, a BASIC language and a system tutorial program; and four games including the best selling SimCity, Final Flight, Nine Lives and Escotre. In all, the package would cost around $1,000 if purchased individually, but Atari's retail price is around $600!

The new Family Curriculum bundle includes 1040STe, color monitor, and a variety of "modules"—Play and Learn module and Junior High (educational software), Computing module (word processor, spreadsheet and database) and Family Activity module (paint program, BASIC language and music software).

Total retail for the individual software packages and system is well over $1200. The package from Atari has a suggested retail of under $700.

Lynx Deluxe Pack

The new Lynx II Deluxe package was also available at the Chicago show, at a suggested list price of $149. The package is, basically, the same as the original package, with California Games, ComLynx cable and power adapter. The only addition is a Lynx carrying pouch. Purchasing all these items separately would cost around $170.

STBook

Shipment of the STBook notebook-size ST is expected in late January or early February '92. One of us (Bill) had the opportunity to "play around" with the STBook at the Chicago show.

Look for a "preview and first impressions" article to accompany the show report next issue. Suggested retail is $1,995.

ABC 386 Computers

Atari has begun shipping their new IBM compatible 386 line of computers. The ABC 386SXII is a 20MHz 80386SX-based system with 1 MB (expandable to 8 MB) of RAM, 40 MB hard drive, SuperVGA 800x 600 video adapter and two 8-bit and four 16-bit ISA expansion slots. Suggested retail is $1,195.

The top-of-the-line ABC 386 DXII uses a 40MHz Am386 processor (from Advanced Micro Devices), 2 MB of RAM (expandable to 64 MB), 80 MB hard drive, 64K cache RAM (expandable to 256K), SuperVGA 1024x768 video adapter and eight 16-bit and one 32-bit expansion slots. Suggested retail is $1,995.

Both desktop 386 machines come with 3.5" 1.44MB floppy, 101-key enhanced AT-style keyboard, one parallel and two serial ports, a game/joystick port, MS-DOS 5.0 and Microsoft Windows 3.0.

To fill out the new PC line, there's the ABCN3865SX (also called the PCBook), a notebook size 20MHz machine with 1 MB of RAM (expandable to 5 MB), 3.5" 1.44 MB floppy and optional 60 MB hard drive. The system has a suggested retail price of $2,895.

For more details on these computers, contact Bill Rehbock of Atari Computer Corp. at (408) 745-2082 voice or (408) 745-2083 FAX.

UNIX

The Atari System V (ASV) Developer's Kit has begun shipping to developers in Alpha test form. Atari's implementation of UNIX is based on System V Release 4.0. The interface is based on XWindows 11.4 and OSF/Motif 1.1.2. The UNIX package includes XFaceMaker 2, WISh2 Desktop Manager, GNU C and C++ compilers, GNU gdb debugger, AT&T System V sdb debugger and a networking package.

Included in the developer's kit documentation are user guides for WISh2, Wx2 and XFaceMaker, Atari's System V Developer's Guide and the Atari Style Guide, an enhancement to the Motif style.

The TT030 ASV workstation requires a minimum of 8 MB of RAM, a 213 MB hard drive and TTM195 19" monochrome monitor. The full developer's kit comes with TT030 with MC68882 math coprocessor, 2 MB ST RAM and 16 MB TT Fast RAM, a 3-button mouse, TTM195 and choice of 200 or 340 MB hard drive.

For additional details, contact Art Pruzynski, Atari's System V Marketing Manager, at (408) 745-2172 voice or (408) 745-2088 FAX.

ST/STE/TT Docs

According to UK sources on Usenet, Atari UK has released Atari's ST/STE/TT Developer documentation in the form of four books, now available for purchase by the general public.

Book 1, *Programming Guides GEMDOS/BIOS and General Programming,* contains 238 pages at a price of £29.99.

The book includes the GEMDOS Reference Manual, pexec Cookbook, Hitchiker's Guide to the BIOS, AHDI, Still Another Line A Document (SALAD), Intelligent Keyboard Protocol, CHKDSK3 docs, and MIDI Associate Address Sheet.

Book 2, *Programming Guides—New Machines,* is 184 pages including the Rainbow TOS Release Notes, STE Developer's Addendum, STE TOS Release Notes, TT030 TOS Release Notes, TT030 Hardware Reference Manual, and VME Expansion for TT and MEga STe.

The book includes two disks of utilities, examples, XControl extensible control panel and docs for £29.99.

Book 3 is actually a combination of two books: *Programming Guides—GEM VDI* and *Programming Guides—GEM AES*. The combined set is 514 pages and costs £49.99.

The last book is called *Hardware and Chip Specs* (228 pages, £29.99) and contains engineering hardware specs for ACSI, MC6850, 68901, ay3-8910, wd1770, Blitter chip, monitors and cartridge port. Schematics are included. Books 1-3 are available as a set for £99.99. For more details, contact:

Atari UK Software Support
Atari, Atari House
Railway Terrace
Slough, BERKS
United Kingdom SL2 5BZ
Telephone: 0753 533344.

MetaDOS Release

Atari has decided not to release their CDAR-505 CD-ROM drive since users can currently buy the same drive (a Chinon CDX451) at a cheaper price than Atari could deliver, according to Bill Rehbock. Instead, Atari is releasing MetaDOS, Atari's CD-ROM driver software, to the general public as Freeware.

Using MetaDOS, any Atari owner could purchase their own CD-ROM drive and connect it to the TT's SCSI port or to any ST via an ICD host adaptor (call ICD for details on CD-ROM drives being supported by their software).

With Chinon CDX451 drives selling at under $400 from a number of sources, these drives are well within the price range of many users.

FSM GDOS

As of mid-December, FSM GDOS should be available from your local dealer at a suggested retail of $59.95. FSM GDOS supports scalable fonts, rotation of fonts and lots more. Best of all, FSM GDOS is *much* faster than Atari's original GDOS.

A number of fonts are included in the package, as are printer drivers for:

DeskJet 500, HP LaserJet, HP PaintJet, Epson FX80, Star NB15 and NX1000, NEC P-series, Okidata 120, Atari SLM804/605 and SMM804, and Canon BubbleJet.

Santa Says: Stuff your stockings with clip-art from ESG! Spruce up next year's flyers and newsletters ordering IMG or vector clip-art! Now is the time to buy! IMG disks are only $4.00 each, IMG Volumes $15.00! Vector clip-art comes in CVG (Calamus), GEM/3 and ascii-EPS formats (EPS files require Postscript printer), and start as low as $15.00. To learn more about ESG's clip-art, write and ask for the free catalog, which describes each of the over 200 IMG disks and over 35 IMG volumes.

Right on Target

David Plotkin
Contributing Editor

> **So maybe, just maybe, selling Ataris mail-order is a good idea. Of course, the places that sell the machines would need to be able to answer questions...**

Every month, I get a magazine called "Computer Shopper." It is huge—usually over 1.5 inches thick. It contains very little in the way of editorial, though what there is is usually of pretty high quality. So what do they fill the rest of this massive magazine with? In short, advertisements.

You see, Computer Shopper is a magazine dedicated to the mail-order market for computers and computer accessories. In its pages, you can buy everything from fully configured 486 computers, hard drives, monitors and printers down to cables, plugs and memory chips. There are literally hundreds of advertisers who appear in the pages of Computer Shopper month after month.

How Is This Possible?

What you have to ask yourself is how do they do it? How can companies sell so much stuff that it pays them to advertise every month? Especially when you consider that the prices charged are considerably below what you'd pay in a retail store. The answer, of course, is the large size of the PC and Mac markets (the bulk of the ads are for equipment to service these two markets).

Mail order has always been cheaper than buying in a retail store, which has produced some hard times for computer stores. For one thing, mail order operations don't need to support expensive store fronts with salaried salespeople, and all the overhead that goes with that. They tend to be warehouse operations with a lot of phone lines, where most of the employees need only have enough skill and training to take orders.

There should, of course, be people around who can answer technical questions about the merchandise, but there isn't always. Further, prices can be cheaper because, if you do business with an out-of-state firm, you do not need to pay sales tax. You *do* pay shipping, but often that ends up being less than sales tax, especially in states like California (where I live).

Give and Take

What you trade away for those lower prices is some of your security. You can't walk in and try the merchandise, and you can't bring it back and trade it in if it's defective. If there is something wrong, you must call the mail order firm, ship the equipment back to them (often at your cost) and wait until the new equipment is shipped back to you.

Of course, there is no guarantee that a store you do business with will have a replacement in stock—in these days of small inventories, they often have to order a replacement themselves, leaving you in the same predicament.

And, of course, it's not always easy to get questions answered or repairs done when the firm is many states away. Finally, a small percentage of mail-order firms are crooked—they take your money and disappear before any goods are delivered (which is why it is best to use a credit card when buying mail order).

Atari and Mail Order

You *can* buy third party equipment and software for Atari computers via mail order. It used to be that you could buy Atari equipment mail order. Then Atari cracked down to try and protect their shrinking network of dealers.

While the lack of mail-order Atari equipment did little to protect the dealers, it did make that equipment harder to get (many locations don't have a dealer within a reasonable distance) and more expensive.

As Atari equipment fades ever further from the mainstream, you have to ask yourself if a massive mail-order setup might not be their last hope. It has the possibility to move a lot of machines (provided that Atari can build the machines, something I'm still not clear on) by making them cheaper and easier to find.

There is a precedence for fairly sizable computer companies making their wares available exclusively by mail-order. A whole host of PC companies, including such notables as Dell, Northgate and Austin are only available mail-order. They have well-staffed phone lines with knowledgeable people, and even manage to provide fast turnaround on their servicing.

Some companies contract with service companies such as GE or Honeywell so that if something goes wrong, a serviceman shows up on your doorstep, or you can take the machine to a nearby service center. Servicing your computer becomes as commonplace as servicing your washing machine or TV.

One of the pluses for Atari allowing its computers to be sold mail-order is that their dealers could become mail-order suppliers, delivering machines and competing in markets far-removed from their storefronts. The need to advertise would bring in more business for the (also shrinking) Atari magazine market. Purchasers of computers need disk drives, software, hard drives, printers, monitors and accessories, so a considerable amount of additional advertising would appear to get the word out.

Bringing Good Things to Life

Atari is negotiating with GE to have them service Atari computers. This would be a good thing on its own, and would give a real boost to the notion of mail-order Atari computers. All but the smallest towns have a GE service center nearby. My own company has their PCs serviced by GE, and the service is fast, efficient and professional. They always seem to have the right parts—these guys really know what they are doing. If an Atari computer could be serviced that efficiently, one of the major obstacles to purchasing one would be removed.

So maybe, just maybe, selling Ataris mail-order is a good idea. Of course, the places that sell the machines would need to be able to answer questions and set up service calls, just as the PC mail-order houses do.

I've said this before and I'll say it again: Atari needs to get more machines sold and build their user base, or 1992 may be the end of it.

Atari's most powerful advertising has been their users, who are loyal almost to the point of being fanatical. As this group grows smaller, their ability to influence others also shrinks—starting a spiral that spins itself into nothing. On the other hand, an expanding user base spirals ever upward, drawing more and more people into its orbit.

Now *there's* a happy thought. See you next month.

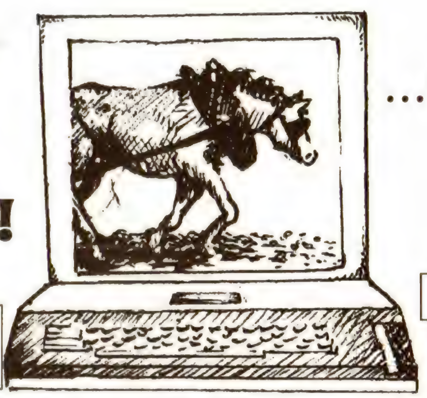
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

Power Products for your 1050 drive

$69.95 THE SUPER ARCHIVER $69.95

The Super Archiver is more than just another double density high speed upgrade for your 1050 drive. Rather it is the most powerful **copying and disk editing** 8-bit tool available! Copies are **exact duplicates** of the originals: no patches or PDB files needed. Installation consists of a plug-in module and six simple solder connections. Software included. Only $69.95 + $5 S/H/I. Features include:

- TRUE DOUBLE DENSITY
- ULTRA SPEED read/write
- FULLY AUTOMATIC COPYING
- EXTRA MEMORY SUPPORT
- SCREEN DUMP to printer
- HEX/DECIMAL DISPLAY
- SECTOR or TRACK TRACING
- DISPLAYS HIDDEN PROTECTION
- AUTOMATIC/PROGRAMMABLE
- PHANTOM SECTOR MAKER
- ARCHIVER/HAPPY ARCHIVER COMPATIBLE
- BUILT-IN EDITOR reads/writes/formats up to 35 sectors/track
- CUSTOM FORMAT tracks up to 40 sectors
- BUILT-IN DISASSEMBLER
- TRACK MAPPER displays up to 42 sectors
- ADJUSTABLE/CUSTOM SKEWING
- AUTOMATIC SPEED COMPENSATION

$99.95 THE SUPER ARCHIVER II $99.95

The **SUPER ARCHIVER II** edits and copies all **ENHANCED DENSITY** programs plus retains all the features of our **SUPER ARCHIVER!** (see above.) This allows you to **COPY** or **CREATE** single or ENHANCED DENSITY protection schemes (including **PHANTOM SECTORS!**). Completely automatic and compatible with the **SUPER ARCHIVER I;** a truly **POWERFUL BACKUP/PROGRAMMING** device! Only $99.95 + $5 S/H/I. ***NOTICE!*** If you already own a **SUPER ARCHIVER**, you can upgrade to a ***SUPER ARCHIVER II*** for only $29.95 plus $5 S/H/I (disk only-no additional hardware required).

$79.95 THE BIT-WRITER $79.95

The Super Archiver **BIT-WRITER** is capable of duplicating the 'uncopyable' EA and SYN series which employ 34 FULL sectors/track. It performs its feat by re-assembling the track into bits, then writing it all back out. Simple installation: **PLUG-IN** circuit board and four solder connections. The **SUPER ARCHIVER** with the **BIT-WRITER** is the ultimate backup tool for the 1050 drive. **EXACT DUPLICATES** of originals are made. Must be used with the **SUPER ARCHIVER**. Only $79.95 plus $5 S/H/I.

>> FALL SPECIAL! << Order the ***SUPER ARCHIVER*** and ***BIT-WRITER*** combination for only **$149.95** plus $5 S/H/I!

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

***>> Fall special** price - **$59.95!** <<*

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + **$5** S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Eight Bits of Atari History, Part 4 or The Way It Might Have Been

Ed Hall
Contributing Editor

In this installment, we'll look at Atari's performance in the video game marketplace.

Atari Still Video Game King!

The appearance of IBM's PC in 1981 may have validated the personal computer to corporate America, but it also marked the beginning of fresh turmoil.

The firm which stood to lose the most because of IBM was Apple, for both companies had set their sights on the high-end market and the business world. It did not take long for IBM to overtake Apple's lead. By the end of 1983, Big Blue commanded about one-third of the market and had displaced Apple as the industry leader.

The year had begun well for Apple with John Sculley coming from Pepsi to replace Mike Scott, who had left in 1981. The Lisa and the Apple //e were both introduced that year. For a while, Apple's stock soared.

Then, just as was happening with videogames, the entire market began to sour. There was a recession on. Also, people were becoming fed-up with the glut of lousy games cranked out by greedy companies, and people were confused by the hyperbole spouted by competing computer brands.

The industry needed a cooling-out period, and the consumer waited for the marketplace to settle down, for the options to become a bit clearer.

Though Apple did $983 million in sales for 1983, it also suffered its first quarterly drop in profits, and its stock fell from a high of $63 to a low of $17. When the Lisa failed to crack the office market, it became clear that Apple's future rested with the Macintosh, even though Apple II sales remained surprisingly strong.

But, after a glitzy launch in 1984 and strong early sales, the Mac stalled. Many observers credit the leadership of John Sculley with keeping the company from going under.

A power struggle developed between Sculley and the increasingly erratic Jobs. It came to a head in 1985, which was to prove the most difficult year of all in Apple's history.

Woz left the company in disgust and sold all his stock. Other key people began to leave the company as well, including Burrell Smith, the principal designer of the Mac, burnt out by Apple politics and 100-hour work weeks.

Finally, things came to a head between Sculley and Jobs, and Jobs was removed from his position as chairman. Stung to the quick, he resigned. Twelve hundred people were laid off. Morale was very low.

Atari's Troubles

Atari began to unravel a year earlier than Apple. At the time, it was at the peak of its fortunes, with over 10,000 employees worldwide and some 70 buildings in Silicon Valley.

Revenue in 1982 was its highest ever—$2 billion—but just before the year ended, Warner announced its earnings for the last quarter would not be as high as originally predicted, due to a slump in the videogame market. Immediately, Warner stock lost a third of its value.

In 1983, Atari suffered staggering losses—$450 million. It laid off 1,700 people and accepted the resignation of Kassar, who was under investigation by the Securities and Exchange Commission for insider trading.

Warner replaced Kassar with James Morgan, a VP from Phillip Morris, a tobacco company. Morgan continued trimming operations, but he couldn't staunch the bleeding quickly enough. Warner Communications had already become the second biggest corporate loser after Chrysler, and it had to get rid of Atari fast. That's when Jack Tramiel arrived in 1984. At last, Atari was back in the hands of someone who knew the business.

Tramiel slashed Atari's bloated corporate structure until only a single building remained, and he concentrated the company's resources on developing the ST computers. This meant abandoning the videogame market, of which Atari still controlled seventy-five percent in 1984.

Tramiel shelved the 7800 game system, which had been unveiled just two months before he took over the company. Though its CPU was the aging 6502, the machine employed a new graphics chip dubbed Maria, which was Atari's first departure from the venerable player-missile system. The result was state-of-the-art graphics. Had the 7800 been released as planned in 1984, Atari might have maintained its market lead. By the time they realized videogames were still a viable product, it was too late.

In 1986, Atari re-introduced the 7800 and brought out the 2600 (VCS) in a new case. In 1987, the XE Game System was released—which was the 65XE computer in a new case—and offered its customers recycled software that was as much as five years old.

These are not the moves that a company makes when trying to corner a market. They are what a company does when trying to pick up crumbs at someone else's dinner table. However, part of Tramiel's business philosophy is that it's often better not to be first into a market, because then you can capitalize on the mistakes of others.

In 1989, Atari made a strong move in the video game market by acquiring the Lynx, a handheld game machine which had been developed by a software company named Epyx. By then, the lead of Nintendo and Sega seemed almost insurmountable. Astonishly, Atari was no longer videogame king. Ironically, its computers continued to suffer from the image of "game machines."

Postscript: More "Science Fiction" Plots

Steve Jobs, after being ousted from Apple, is now heading up a new company called NeXT, which is producing workstations. One of the first business deals he struck was with his old foe, IBM.

Nolan Bushnell is now working for Commodore.

Warner Brothers still owns a sizeable chunk of Atari.

Apple and IBM recently announced an "alliance" in a bid to counter declining sales.

Annotated Bibliography

1. General

Fire In The Valley: The Making Of The Personal Computer by Paul Freiberger and Michael Swaine. (Osborne/McGraw-Hill: 1984)

This book is a good history of the chaotic early years of the microcomputer industry. Apple, Atari and Commodore are only part of this story. Find out about the other guys, such as IMSAI, Cromemco, and MITS.

Hackers: Heroes Of The Computer Revolution by Steven Levy. (Doubleday: 1984)

Engagingly written, this book brings to life the exuberant adolescence of the microcomputing industry, and has enough oddball characters in it to populate several Donald Westlake novels. You'll read about some of the crazy goings-on in the early days of Sierra On-Line, the company built by programmer Ken Williams and his wife Roberta (author of all those King's Quest adventures). There is an interesting courtroom scene when Atari brought suit against Sierra for copyright infringements on Pac-Man. This book is a must-read.

Silicon Valley Fever: Growth Of High Technology Culture by Everett M. Rogers and Judith K. Larsen. (Basic Books: 1984)

Of the flurry of books about computers which suddenly appeared in 1984, this one is the most dated. It gives a broad picture of life in Silicon Valley, and deals briefly with just about everything—venture capital, espionage, housing, the divorce rate, burnout, women in the industry, how a microprocessor is manufactured, etc. It also gives brief sketches of Apple, Hewlett-Packard, Intel, and assorted personalities.

The Soul Of A New Machine by Tracy Kidder. (Little, Brown: 1981)

This book describes the making of a new model of mini-computer by a group of employees at Data General. Despite its title, the book's focus is on the people rather than the machine. Although it has nothing to do with Atari or personal computers, it's worth reading for the insight it gives into the enormous personal cost required to produce a computer. Steve Jobs will look like less of an ogre after you read this book (which, incidentally, won a Pulitzer Prize). You'll love the prologue.

2. Apple Computer

Steve Jobs is, according to Jean-Louis Gassee, who eventually replaced him as head of the Macintosh division, "that handsome and tragic character out of some novel, that visionary monster, aesthete, lonely, detestable and fascinating creature." No wonder so many books have been written about him and Apple Computer. The cream of the crop are:

The Little Kingdom: The Private Story Of Apple Computer by Michael Moritz. (William Morrow and Co,: 1984)

Steve Jobs: The Journey Is The Reward by Jeffrey S. Young. (Scott Foresman and Co.: 1988)

West Of Eden: The End Of Innocence At Apple Computer by Frank Rose. (Viking: 1989)

"The Little Kingdom" focuses on Apple's early years and has little on the development of the Lisa and the Mac. "West of Eden," the most engagingly written of the big three, picks up where "The Little Kingdom" leaves off. "The Journey" is encyclopedic in its detail, and covers the entire period that Steve Jobs was at Apple.

Accidental Millionaire: The Rise And Fall Of Steve Jobs At Apple Computer by Lee Butcher. (Knightbridge Publishing Co.: 1990)

The slightest of the books about Apple, it offers little that is new. Read it only if you want a quick potted history of Steve Jobs and the Apple story.

Odyssey: Pepsi To Apple... A Journey Of Adventure, Ideas And The Future by John Sculley with John Byrne. (Stoddart: 1989)

Who is John Sculley? He's the man who got rid of Steve Jobs, and this book was written to expiate that guilt. Is he a skilled corporate hitman? Or a decent, hardworking person who saved Apple from itself? In support of the latter, he offers a picture of himself making a peanut-butter sandwich.

3. Atari and Commodore

Home Computer Wars by Michael Tomczyk. (Compute! Publications: 1984)

This book begins with the author taking home a pre-production Atari computer and playing Star Raiders obsessively for three nights in a row. A week later he quit his job, started learning BASIC and began seeking work in the computer field. Though he subsequently received job offers from both Apple and Atari, he ended up with Commodore. The book is memorable for its portrayal of Jack Tramiel.

HAYAI

For hard disk to hard disk backup and defragmentation
Copy verification with a unique compare function

Graphic Mouse/Keyboard Gem Interface
Fastest possible data transfer rates

UP TO 30 MEGABYTES/MINUTE

Guaranteed to be error free
Preserves essential fat information
Trap system hardware defects
Defrags as it copies
Single SyQuest cartridge to cartridge copy
Monochrome only

HAYAI 512 *for Supra, AHDI, and ICD ...79.95*
Logical sector sizes must be 512 bytes

HAYAI SAMESIZE *for AHDI and ICD...79.95*
Origin and destination sector sizes must be equal

HAYAI DIFFSIZE *for AHDI and ICD...79.95*
Origin and destination sector sizes need not be equal

Make your Atari FAST!
WARP 16 FAST!

The *WARP 16* accelerator + cache board contains a high speed 68000 CPU that replaces the slower 68000 CPU currently used in your Atari.

By taking advantage of the large amount of high speed cache ram on the *WARP 16* board this CPU is able to run programs at twice the speed of an unmodified Atari.

Routine tasks such as spellchecking, spreadsheet calculations, screen redrawing, and laser printing take a fraction of the time they used to.

No longer are you frustrated by waiting for your computer.

WARP 16's custom logic allows caching of both reads and writes AND caching of both "byte" and "word" memory accesses.

What does all this mean?

Your Atari moves FAST! *WARP 16* FAST!

Features:
- 16MHz CPU accelerator with cache for all Atari ST/MEGA computers.
- 80K of high speed static ram. Organized as 16K cache-tag ram + 64K cache ram.
- FOUR TIMES MORE cache ram than any other Atari accelerator on the market.
- User selectable "stock ST" mode gives 100% compatibility with ALL Atari software. Even Spectrum 512.
- For use with Atari ST, MEGA, and STACY computers.
- STE version available soon.
- Don't settle for other upgrades that offer tiny amounts of cache ram, or offer compatibility with 80% of existing software.
- *WARP 16* offers a full 64K cache + 100 percent software compatibility.
- Dealer inquiries welcome.
- Order your *WARP 16* TODAY!

WARP 16 $349.95 (U.S.)

Add $4.50 for shipping and handling. Note: *WARP 16* requires installation by a qualified computer technician. This installation may be done at your local computer repair shop. Call us for details.

HAYAI

30 MegaBytes/Minute

30 MegaBytes/Minute

30 MegaBytes/Minute

30 MegaBytes/Minute

Jerry Enos

Hayai (hah-yah-e, accent on second syllable) is a Japanese word for fast, speedy or quick. Hayai is a three-version suite of high speed partition to partition copiers for hard disk to hard disk backup and/or defragmentation.

The manual serves as a reference for all three versions of Hayai. Hayai 512 can be used only with partitions formatted with logical sector sizes equal to 512 bytes. Supra's current hard disk driver requires this version. Hayai 512 will also function with AHDI, Atari's driver, and with ICD drivers if the logical sector sizes of involved partitions are 512 bytes.

Hayai Samesize can be used to copy data between partitions with any logical sector size as long as the logical sector size of each partition is identical to that of the other. Supra's current driver is not compatible with this version of Hayai.

Hayai Diffsize can be used in any situation where Hayai Samesize can be used. However, Hayai Diffsize has been designed to copy data between partitions with differing logical sector sizes. Because the data configuration must be transformed to fit into a new logical sector size, Hayai Diffsize moves data at a slower rate than the other two versions of Hayai.

> ***Finally, I can do my backups and defragment my hard drive without the loss and degradation of my data.***

Main Screen

The screen shot at the top of the following page shows the first screen you see when you enter HAYAI. This particular snapshot shows drives M-O with light shading. This shading indicates those drive letters correspond to removable media partitions (e.g., a SyQuest drive). The three buttons at the bottom of the screen initiate the copy and compare functions. These buttons give you the choice of copying one partition to another, comparing two partitions, or designating that a comparison automatically follow a copy.

The lightened drive letters indicate the absence of these partitions from the system configuration; the remaining drive letters indicate the current active non-removable drives on your system.

The drop down menus at the top of the screen are for setting program parameters, accessing dialogs, viewing online help menus, Items in the drop down menus can be activated via mouse selection or function keys F1-F5.

For example, *Save Configuration* in the *File* drop-down menu is accessed by moving the mouse arrow selector over the file menu item, or by pressing the F2 key. When you click on *Save Configuration*, all program settings are preserved by writing them to disk. When next the program is executed, *Removable Media partitions*, *Origin partition*, *Destination partition*, *Same Drive* and *Same Partition* selections, and *Filesize/Start Cluster Options* will all be as they were when you last used *Save Configuration.*

The other option, *Quit*, will exit the program without further warning.

Note: Whenever menu boxes are dropped via the function keys, you can select items from the keyboard while the menus are being viewed.

Options

Enable part to part SAME DRIVE permits copying data between partitions on the same drive. This option alleviates

the tendency to inadvertantly copy from partition to partition on the same drive.

Enable cart to cart SAME PARTITION permits copying data between partitions on the same cartridge on removable media drives.

Depending on the item selected, these will deselect all *Origin, Destination,* or *Removable Media* buttons.

Filesize/Start Cluster Options will display a dialog of choices for each partition. *Identify Removable Media Partitions* displays a dialog to select removable partitions.

Filesize/Start Cluster Options

This dialog permits keeping or ignoring any files beginning in cluster zero or having a size of zero. Many files with these characteristics are created as a result of an error. In most cases, it is a good idea to remove them from your system.

Hayai gives you the option of keeping (*Retain*) or removing (*Elim*) them because a few programs intentionally create files with these characteristics. These programs will usually just recreate them if they don't exist.

Under the current operating system, files are not allowed to reside in cluster 0. But, since certain programs create zero-length files, they do exist. (When the system has a zero-length file, it places a zero in its fat position, signifying the next cluster is in byte zero of the fat table, when in fact there can be no file in the zero cluster.) The zero in a fat location signifies that the cluster is actually free. So as a matter of course, you can see the dilemma involved in the aberrant use of the zero length file.

Removable Media Partitions

For those fortunate enough to own SyQuest removable drives, you can identify partitions on that drive. This option is provided as a convenience to make the program more understandable to those who have such a unit. It doesn't make a difference to Hayai which type of drives are involved in the data transactions.

If you do own a SyQuest, though, Hayai gives you the ability to backup one cartridge to another on a single SyQuest mechanism.

Help and More Help

The amount of on-screen help is shown by the two selections; *Help* and *More Help*.. All the major (and minor) options in Hayai are covered. Included here are RAM requirements, read and write errors and keyboard codes.

The *Keyboard Codes* in the *More Help* menu describes the keyboard keys used to select menus, partition buttons and the other functions used in Hayai. At anytime during the program, if you want to see these keyboard equivalents, you can just press the Help key.

Program Execution

To use Hayai to backup a drive, a valid *Destination* and *Origin* partition must first be selected. The *Destination* partition must be chosen with care, as any data currently on that partition will be replaced by incoming data.

At the end of the copy procedure, Hayai displays some statistics, based on which options were selected. The *Data Copy Rate* is shown if you selected the *Copy* or the *Both* button, the *Data Compare Rate* is shown for the *Compare* or *Both* button, and the *Copy/Compare Average* is shown if both a compare and copy are performed.

So, a compare can only be performed after a copy, but a copy can always be performed, with or without the compare. The statistics shown in the snapshot below were for a partition to partition transfer on a Quantum 210S hard drive.

Times vary between different drives. Slower times are usually associated with older drives and SyQuest removables. Data transfer rates vary according to the number of kilobytes per second. Using ICD's RATEHD.PRG, I have recorded rates ranging from 300 to over 1000 kbytes/second. A drive rated at an access time of 22ms usually can expect data transfer rates of over 1000 kbytes/ second.

at a byte location is usually an indicator of hardware problems, such as a bad sector. I had such a problem and managed to fix it with something as simple as a new cable. Thanks to Hayai, I was able to locate the problem before any significant damage evolved.

Conclusion

I believe Hayai to be necessary to anyone who backs up data frequently or to anyone who wants to validate their data. I have two drives; a SyQuest 555 removable and a Maxtor LXT-213S. I use an ICD Host Adapter, with both drives mounted in one case. The two drives are rated at 32ms and 21ms respectively.

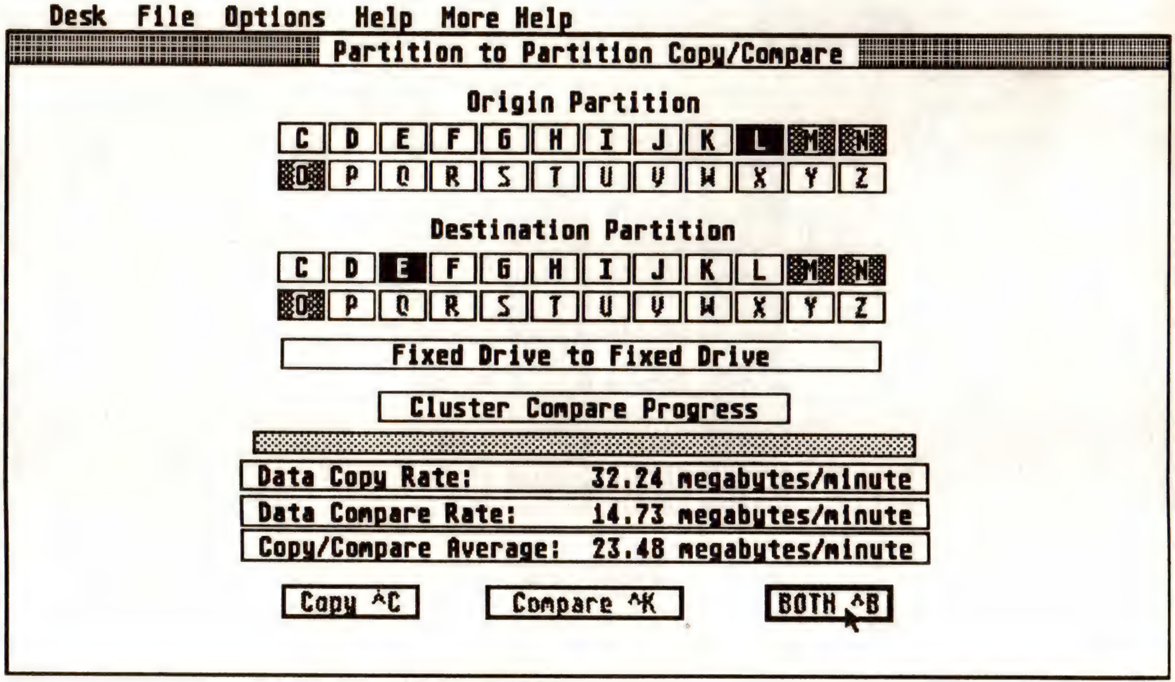
Backing up from the hard drive to the SyQuest takes 10 to 15 minutes. My back-ups usually consist of transferring 130 Megabytes from my hard drive to my SyQuest, changing cartridges three times. This is better than the four hours it used to take using floppies. I recommend Hayai for the following reasons:

- Data integrity
- Fast back-ups
- Defragmenting
- Works with both removable and non-removable hard drives
- Can copy between different sized logical sectors

Is Hayai meant for everyone? The answer is: if you have a hard drive or removable drive, then Hayai will increase the efficiency of your system. For the first time, full speed backups and defragmentation can be accomplished without the worry of data loss that has become associated with high speed data transfers .

Comparison Failure

Hopefully, you will not see one of these, but if you do, here are some suggestions. A Comparison Failure is an error report showing the disagreement between two bytes, one on the destination partition and the other on the origin partition. A comparison failure



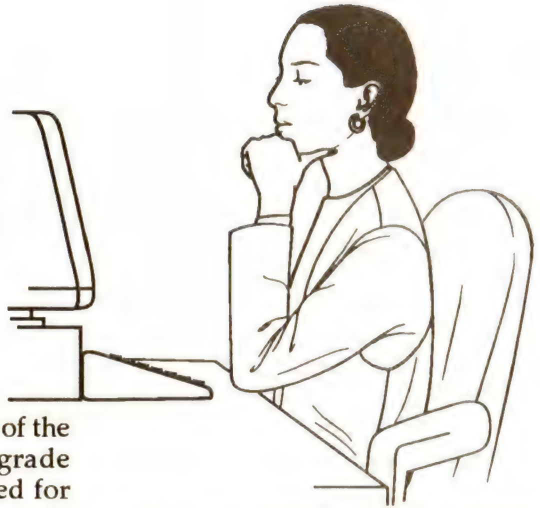
Fixed Drive to Fixed Drive

Data Copy Rate: 32.24 megabytes/minute

Data Compare Rate: 14.73 megabytes/minute

Copy/Compare Average: 23.48 megabytes/minute

Future of the 8-bit—A Reply



Jerry Bridgman

I was pretty amazed by Chuck Steinman's article "What Does the Future Hold for the Atari 8-bit User?" I expected it to be some fairly lame stuff about hanging in there.

Upgrade Routes

What it turned out to be was a description of two routes to cease being an 8-bit user! (an exclusive 8-bit user anyway.) Don't get me wrong—I am intrigued by the two major projects he is proposing. But I still think it would be well to ask the basic question "Why?"

I mean, we have several routes already available to go up from 8-bits. And if we want to still use our old machines as well, we can just leave them hooked up to our TVs.

This has the advantage that if two people in the household want to use a computer at once, there are two computers to use! Anyway, I don't personally know of any 8-bit software that isn't completely outdone by something on the ST.

There are natural replies to all this: We have a big investment in our present systems; there is no reason why an 8-bit with a meg or two of RAM couldn't run state-of-the-art software, so let's write some; it's time consuming to learn a whole new machine language; there are better, more compatible chips than the Motorola 68000; Atari doesn't advertise, so the ST and its progeny will go down the drain soon, too; there's a lot to dislike about Apple and IBM; the world thrives on diversity, etc.

How 'bout This?

But, if you buy that, what of the following suggestions? Upgrade by using the chips developed for the Lynx. These chips include sound and math co-processing as well as the extremely compatible 65C02 running at twice the speed. Or, we could use Motorola's own math coprocessors which, according to Byte Magazine, are compatible with the 6502.

If I had my choice, I would like to have a chip very similar to the 6502, except capable of running at a much higher clock speed—12 MHz is a gutsy wish I read in an Atari newsletter. (Let it default to 1.79 MHz.) Supplemented with some custom chips, that would keep me happy for a few months anyway!

More to the Point

There is a deeper point to be made here. I have read in a couple of sources that the personal computer revolution has been accompanied by no increase in white collar productivity.

What's enough to drive you crazy is that this fact is simply mentioned without any recognition that this is an odd, if not damning, fact. What it seems to say is that computers are more expensive than they are worth! Apparently, computers increase productivity on average only enough to pay for the computers! This is, as they say, a poor return on investment.

So maybe we should keep our computers, only upgrading in the most efficient ways. But this only makes sense if there is going to be software.

I await more news from Chuck Steinman.

SHAREWARE & PD

A great PD catalog with great prices!

It's true! Our catalog offers full multi-line descriptions for over 150 double sided disks packed to the brim with the very latest public domain and shareware software—all archived to give you the most for your hard-earned money. Each disk is also protected by a virus guard to eliminate any worry about system problems.

Send $6.00 for your 80+ page catalog and receive a bonus $6.00 coupon for a complimentary first purchase. Our everyday low price is $6.00 per disk.

CHROMA-CAD

3D CAD Modeling on the Atari Classic 8-Bit

Bob Woolley
SLCC

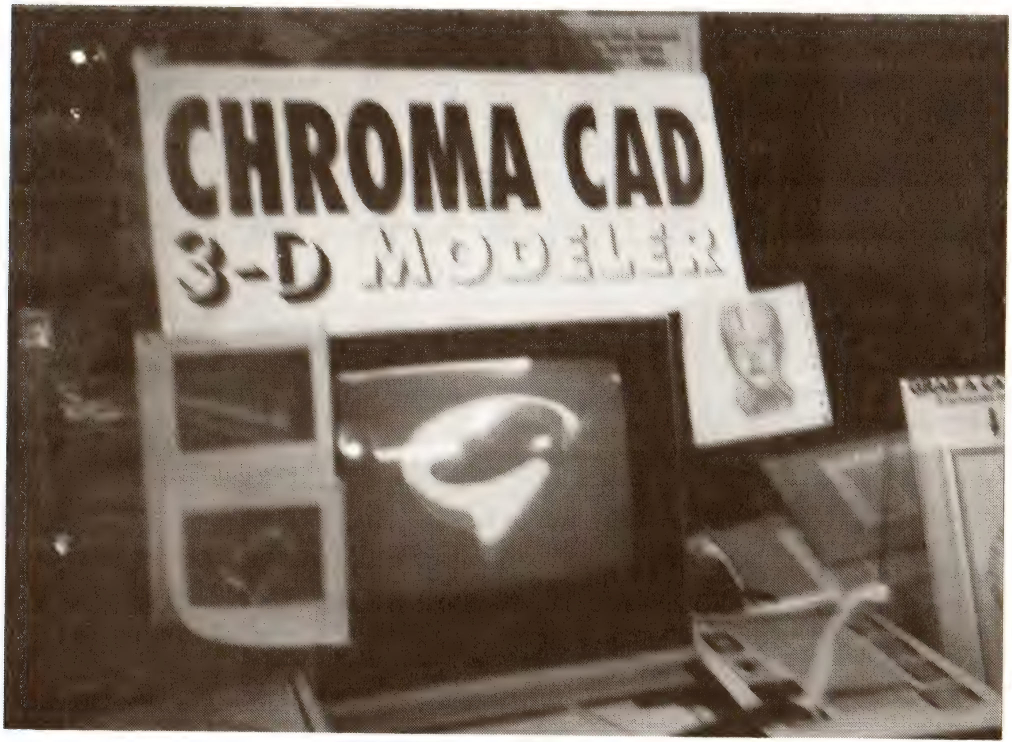
You know what I would like to do on my computer? I want to do one of those bouncing Fuji demos, only with the letters SLCC (San Leandro Computer Club) instead of a Fuji.

You know the demo I'm talking about—the Fuji Boink one, where the Atari Fuji spins and bounces around the screen? They really did a nice job on that one...as the Fuji spins, each surface changes shade according to its orientation towards the incident lighting. And, when it is perpendicular to the viewer, you can see the background through the openings in the Fuji!

On mine, I think I'll have the individual letters rotate at different speeds and at an oblique angle. Maybe once in every two seconds or so, I'll make the letters line up to spell SLCC.... Sound neat? No? OK, so you do your *own* club's letters. Sounds too hard? You aren't an artist with a lot of time on your hands? Neither am I. But, I've got a copy of ChromaCAD.

I am going to refrain from referring to ChromaCAD as an outstanding program "on an 8-bit," since it is really in a class by itself on *any* platform. The producer of ChromaCAD, Marver Seaman, states right in the introduction that he plans to port his creation to "all the more popular 16-bit and 32-bit computers." (When will he have time to sleep? This is a major piece of software!) While it may run faster on the larger machines, the form and function will be preserved across hardware implementations.

So, dust off the old 8-bit and take a facinating trip into the world of solid modeling on your computer. When the TT/MAC/MSDOS version comes out, you'll already be a pro at this stuff!



Overview

First, let's try to present an overview of just what this program does.....

Imagine any object sculpted in soft clay—a car, a computer, a can of Diet Coke even. Also imagine a thin shell applied to the clay, sort of a dipped ice cream cone effect.

Take that creation and run it through a giant egg slicer. You now have a quantity of thin disks that, once stacked in the proper order, form the original object. Carefully remove the clay from each slice, leaving the shell. Go around each slice and break the shell into small triangles—make them small enough so they are essentially flat. Record the location of the corners of each of these triangles in a list. From this list, you can now re-create the original object in three dimensions at any time.

That is basically what you do with ChromaCAD.

Your first thought may be "You are going to need a *lot* of slices to make anything significant." You are quite correct. The slices are actually a series of connected triangular wedges taken from the outer surface of the object—one of the models supplied with the program has 8000 wedges! Get the idea?

You can specify one of six "Paints" for each triangle in your model, each paint being one of over 4000 colors, giving you an almost unlimited palette. When rendered, these paints will assume their calculated intensity according to the amount of light striking each wedge, producing a very realistic view of the original object.

So? Why go to all this trouble? Just take a picture of the thing and slap that in one of those nice color scanners and display it on the screen!

Exactly. But where do you hold the camera when you take the picture? What size lens? Where do you place the lights? How strong do you make the lights? How do you change colors, shades, and contours? More to the point, where do you get the object to begin with?

The whole focus of this program is to create and render a three-dimensional object in any context you wish. All of the preceding parameters (light placement, colors, etc.) can be specified during ChromCAD screen generation. You can even generate a view of the object as a stereo/3D image to be viewed through a pair of red and blue 3D glasses supplied with the program.

Once you have the thing defined, you can look at it from any point of view—even from inside the object itself! And, if you get tired of looking at it, you can print it on your favorite printer (or, possibly at some point, your camera recorder, plotter or whatever). This is not a program that automates the drawing of an object, it is a program that creates an object in three dimensions. Two programs, actually.

Model Builder and Surface Shader

The Model Builder is used to enter the co-ordinates of the object using a joystick and the keyboard and will run on any Atari. The Surface Shader is used to produce a view of these models with the proper shading and perspective and requires an extended memory machine (like a 130XE).

Common to both programs are the menu system and command structure. Each program is available separately and comes with its own manual. Both manuals are somewhat intimidating, since they contain extensive examples and require a significant time investment. But, then again, these are not trivial programs (you *will* produce quite a few blank screens until you get the hang of it!). Do yourself a favor and go through the manual carefully; it does have everything you need in it.

Features

Features? Sure. Each model may contain up to 158 slices—or *lines,* as Marver refers to them. The figurine you may have seen in advertisements for ChromaCAD has only 50 lines, so this is not as limiting as you may think. The detail in each line is only limited by the available disk sectors, up to 1040 sectors on an Enhanced density disk. Again, the figurine in the ads is only around 450 sectors. Both quantities (lines and sectors) are displayed in the program, so you always know where you stand.

The construction volume is a cube 18,000 units on a side, which should be sufficient for those larger-than-life projects! One command presents you with an orientation view that will give you some idea of where you are (literally) without having to wait for the actual object to be drawn.

Wait? Uuuuhhhhh...Yes. In the Builder, you can request a wire frame view of your model—which can take a little time in a complex structure. In the Shader, you get a fully shaded view—which can take a whole lot of time (30 minutes for the figurine). Give it a "Q" (quick view) before you commit yourself to a full rendering. Oh, boy. A 160x200, four color screen. Wow.

Naw. The Shader allows four different modes of showing your model. You can use a six color (dithered) artifacting mode, GR.15, GR.8, and a stereo mode for 3D. In each mode, the program can flip between as many as 8 screens (all of the same view) to simulate 8 luminance levels. This effect is not too pleasing to your eye since there is considerable flickering, but a camera will average these screens very nicely, thank you (Marver is a photographer by profession).

In addition, the printer drivers will produce much higher resolution than is available on the 8-bit screen, including a graded intensity using a worn ribbon.

Complex Constructions

Internally, screens are generated using model data files and a Menu. There are ten menus on each data disk, all of which can be combined into one composite screen. By that, I mean ten different models from ten different points of view can be drawn as one construction—the ChromaCAD title screen is a good example of this. In this way, simple objects can be combined to form other, more complex, structures...although multiple, disconnected models can be built on a single menu if you wish.

Just how is this accomplished? In the Model Builder you begin with a BaseLine—your starting point. What you are doing here is drawing the outline of the first slice of your object. This can be a single point if you like or the complete shape of the object.

The cursor is moved to the first data point with either the joystick or a menu entry (of the X and Y coordinates) and the point is plotted with the period key. The rest of the points are plotted in order around the desired outline where they eventually close.

This BaseLine is then stored and the next elevation is plotted (referred to as the HighLine). During HighLine generation, the outer surface of the model is defined as a sequence of triangles whose vertices lie in both the LowLine and the HighLine.

Each triangle is tagged with one of the six surface "paints" at generation time. These paints are similar to the color registers used in the 8-bits, in that the actual values are generated through indirection—they can be changed at any point (even after rendering. I'd like to see how Marv is going to do *that* on a VGA screen! [grin]).

Of course, the builder program does not generate solid views of your model. Whenever you want some idea of what your object looks like, you can orient yourself in space and request a wire frame view.

The menu entries used for these construction views can then be stored and used (after adding color and lighting information) directly in the Shader program—a much faster path to setting up your output than experimenting in Shader.

In a simple construction (with vertical sides), tools are available to easily complete the HighLine data points. Straight line and circular/elliptical segment macros are also supported in the program. This HighLine/LowLine process continues until the complete object has been defined and you are ready to move into the Surface Shader program.

Fun with Shading

If this sounds like a lot of work, I agree. The Builder is where you do the bulk of your work. The Shader is where you have all your fun.

Once the model is "built," you move to the Shader program. While in the Builder, the ten available menus can be set up to display views of your objects. If these are "ready-to-go," all you must do in the Shader is specify the paint colors, lighting and mode. Or, you can generate all new viewing sequences and positions.

The available colors can be changed after the view is generated, while the lighting and mode are fixed during rendering (although you can request fewer screens in your current mode). The ability to change colors is important since each time you request a new screen to be built takes many minutes. Not much work to Shader, just a lot of waiting.

The end result is a screen to look at. Really, a screen to photograph. For those major projects, Marver has some photo-specific features, such as tiled output and timed display.

Tiled output just breaks the object view into as many as 81 screens and presents them one at a time. Just so you don't have to stand there for half a day to take 81 shots, you can have the joystick ports snap your picture for you.

Timed display compensates for the lack of precision in some cameras when using long shutter openings (I'll take Marver's word for all this). Instead of opening the shutter for a proper exposure, ChromaCAD will display the screen for a fixed time (leave your shutter open continuously).

My first thought was that the figurine in the ads must be a tiled shot—it isn't. Wow, I'd sure like to see one! I have seen the figurine printed in dot-matrix. It looks great, but you can judge for yourself as I've included a sample printout of the figurine.

Opinions?

This program actually does what you expect—I think I spent some time expecting to find the "hook" in this software and just never did. Not that this is *The Program to End All Programs*. You know what I mean—you hear about a program that says it does this, that, and everything else, but when you go to do something on it, it just doesn't meet your expectations.

This is a 3-D model building and rendering program. That's what you are going to get. Not little dinky, simple models. Big, complicated constructions. Real stuff. It is absolutely amazing. Slow, but amazing!

What would I want to change? It would be nice to know how far along the program is while it is generating (rendering) a screen. (The screen is blanked for speed.) The processor has to calculate the visability and intensity of each wedge in the model, so total time is dependent on size, complexity and orientation. You will learn from experience what to expect, but some indicator would still be nice.

I never had any kind of lock-up on the system, so just be patient—it's going as fast as it can. I did try an OmniMon chip on the program, which has much faster math routines. No difference at all. Marver wrote this in Forth and uses his own integer math (sigh).

As it now stands, the programs do not contain a printer driver or a way to save a screen as a DOS file. Both of those routines will be available soon (I have seen the printed output already) and will probably be PD. In the meantime, I could pull out a single view using OmniMon to store $4150-$5FFF as a GR.15 screen. From there, I can do my visual demo or print with existing utilities. [Ed: These utilities will be on an upcoming AIM 8-bit Disk of the Month, as soon as they are available.]

Marver has been very responsive to requests for these add-ons—he has already modified Shader to run on a Rambo upgrade. Under Rambo, you can only flip two screens instead of the normal 8, but this is a limitation of Rambo, not ChromaCAD.

Builder and Shader are already available at your favorite mail order source for $30 each or directly from Palette Imaging at (201) 767-3913. If you like to have fun on your computer, take a look at them!

It would also be nice if a number of constructions found their way onto the boards as PD. Oddly enough, this series of programs is the result of a bet between Marver and his son. Four years after the wager, Marver won his $5. I think I'd like to make a few bets with Marver myself!

ChromaCAD
Model Builder $29.95
Surface Shader XE $29.95

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by:

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required. $\$ 39^{95}$

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945. $\$14^{50}$ ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game. $\$25^{00}$

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY. $\$14^{95}$

800 5 PIECE BOARD SET

Includes Main Board, Power Board CPU, 10K O.S. and 16K RAM Board. All boards new, tested and fully populated. Set includes instructions that will allow you to repair ANY 800 Computer $28.50

1050 REPAIRS

We are now offering a limited repair service on the Atari 1050 Disk Drive. Please call our Service Dept. at 510-352-3787 for a Repair Authorization Number. Units without RA# will not be accepted. Service rate . . $69.95

850 BARE PRINTED CIRCUIT BOARD

Bare Circuit board for Popular 850 Serial/Parallel Interface allows the experienced Technician to assemble an interface to hook up a wide variety of standard Modems and Printers. Includes Parts list and special crystal. ROM code not included. $4.50

850 12 Piece Chip Set w/o ROM $12.50

Buy both the above and get a Power Pak for $5.00

PRINTER INTERFACE

MICROPRINT INTERFACE ALLOWS YOU TO CONNECT ANY STANDARD PARALLEL PRINTER TO YOUR ATARI 8-BIT. WORKS WITH 800XL, 130XE, 800/400, 65XE, XEGS, 600XL. (1200XL requires easy modification). $43.95

BOOKKEEPER & KEYPAD

You get both Atari's 8 bit professional bookkeeping system and the handy CX85 numeric keypad for one low price. Packages Factory sealed $\$19^{95}$ 4 DISK SET

VISICALC SPREADSHEET

Unleash the computing power of your 8 bit Atari with Visicalc. Compute everything from home finances to high powered financial projections. Hundreds of uses. $\$19^{95}$ DISK

Super DataBase 1-2-3

INNOVATIVE PRODUCT CREATES AMAZING DATABASE APPLICATIONS EVEN IF YOU HAVE NO PROGRAMMING SKILL. ONCE YOU CREATE A PROGRAM WITH SUPER DATABASE IT BECOMES A STAND-ALONE APPLICATION THAT RUNS ON ITS OWN. "GENERATE" YOUR OWN PROGRAMS TO KEEP TRACK OF EVERYTHING.

INCLUDES 137 PAGE MANUAL - 3 DISKS $\$59^{95}$

P:R: CONNECTION

Serial / Parallel interface for connecting a wide variety of standard RS232 modems and standard Centronics Parallel printers to your Atari 8-bit computer. Direct replacement for the 850 interface. $79.95

P:R: or 850 to Printer Cable . . $14.50

P:R: or 850 to Modem Cable . . $14.50

Abbrevia ST

Abbrevi ST

Abbrev ST

Abbre ST

Abbr ST

Abb ST

Abb. ST

Available directly from Kyle Cordes for $19.95, including shipping, Abbreviator ST is an easy to use abbreviation expander desk accessory for use with your favorite word processor, database, ect.

Unlike a macro program, Abbreviator uses plain text abbreviations—there are no more cryptic ALT and CONTROL key combinations to remember. The abbreviations of your own choosing are typically short mnemonics representing a frequently used text fragment.

For example, one might use "mon" as an abbreviation for Monday. Abbreviations may be up to eight characters; the corresponding expansions may be up to 480 characters long each and may contain special characters such as tabs, returns, arrows, escape and a special "suppression character." (More on this character later.)

The power of this program stems from this flexibility. The special characters can make negotiating a database easier. Embedded returns make automation of tedious typing sequences. For example, simple "aimadr" could expand to

Atari Interface Magazine
3487 Braeburn Circle
Ann Arbor, MI 48108.

By abbreviating frequently typed text fragments, Abbreviator ST can save you some real time.

As you type, Abbreviator ST replaces your abbreviations by their expansions. The expansion is triggered by certain characters which typically end words—space, period, comma, semi-colon, colon, single and double quotes, right parenthesis or return.

The program intercepts keystrokes at a very low level, making its manipulations on the input transparent to other programs and its compatibility seemingly perfect. It works in virtually every typing situation—even in dialog boxes.

As you type, Abbreviator ST watches your keystrokes, constantly looking for your abbreviations. When one is spotted, it sends enough backspace characters to erase the abbreviation and then sends the expansion. For example, if you type "mon[space]", the program you're using sees "mon[backspace][backspace][backspace]Monday[space]".

The result? Your typed abbreviation is replaced by its expansion. The character that triggered the expansion is passed through as well, so nothing slows down your typing.

It is useful to understand how Abbreviator ST looks for abbreviations. It scans the input, watching for "words" that match its list of abbreviations. A "word" begins after any non-alphanumeric character, including the arrow keys and backspace. A "word" ends with any of the expansion triggering characters listed above.

There are some unfortunate results associated with including backspace in the class of characters which signal the start of a "word."

Consider this example—you have "st" as an abbreviation for "Atari ST." You are typing along and begin to type the word "latest," but you make a typo, getting "latets" instead. You hit backspace twice so you now have "late" and add the correct ending of "st."

The result is quite unexpected—your document now reads "lateAtari ST." When you typed the backspaces, Abbreviator ST began looking for a new word, found "st" and expanded it into "Atari ST."

tue	Tuesday
wedn	Wednesday

This may seem like nitpicking, but this type of expansion breaks your train of thought and could be annoying enough to make you quit using the program. Eliminating this behavior in the program would be rather simple, so it might be removed in a future release of the program. The lesson, of course, is that you have to choose your abbreviations carefully—avoid common suffixes.

4609 Millbrook Way
Bakersfield, CA 93313

There are certain cases where you won't want Abbreviator ST turned on. If you work with a command line interpreter, unexpected expansions like those above can be rather frustrating. If you have 'prg' as an abbreviation for 'program', the command 'zoo x archive.zoo *.prg' will be expanded to 'zoo x archive.zoo *.program' when you hit return, ruining your command.

One of the most convenient abbreviations is "i" for "I"—this automatically capitalizes "I." If you program in a case sensitive language like C, however, you will find your variable "i" capitalized each time you use it—enough to drive you bonkers.

Fortunately, Abbreviator ST has a Hot Key to turn it on or off at any time. The key is user configurable, to avoid conflict with other programs' Hot Keys. Abbreviator ST can also be turned on and off from its control box. You will want to turn Abbreviator ST off in the cases above and in some others.

Because of Abbreviator ST's friendly interface, creating and editing abbreviations is intuitive and easy. You can print, load, and save different abbreviation sets—you are limited only by disk space. You could, for example, use different abbreviations in your word processor and database programs. A configuration page lets you set the default abbreviation file (which is loaded at boot time), hot key, and abbreviation buffer size.

A warning for hard disk users: when you first install ABBREV.ACC and SAMPLE.ABR on your hard drive, it remains configured for an abbreviation file A:\SAMPLE.ABR. When you reboot your computer, Abbreviator ST looks for this file. If the floppy is no longer in drive A:, Abbreviator ST doesn't recover gracefully—it hangs the machine. Otherwise, the program is simple to install and operate.

The program's performance is impressive—there is no noticeable slowdown in your computer. If you choose your abbreviations carefully (to avoid the above pitfalls), Abbreviator ST is out of sight and mind until you need it, so you'll want to leave it installed at all times.

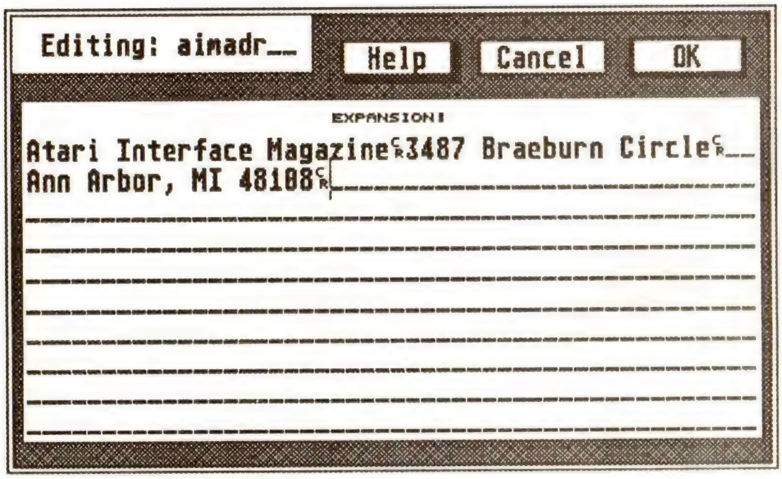
One clever feature is a capture buffer which always contains your last 200 keystrokes. You often don't realize which phrases could best be abbreviated until after you've typed the phrase.

For instance, let's say the first time you type "twentieth century intellectual history" in your paper, you realize you'll need this phrase a number of times. You can bring up Abbreviator ST and click on "Capt"—you are now editing a new abbreviation with your long phrase already typed in for you. Because no retyping is needed, you are more likely to abbreviate things on the spur of the moment.

Another interesting feature is the suppression character (^S). By putting this character at the end of an expansion, the character which triggered the expansion is not passed through to your application program. This is great for our German friends who tend to build up huge words: "utg" could be an abbreviation for "Untersuchungs." When a journalist writes about some new investigatory committee, she can type "utg ausschuss" and get "Untersuchungsausschuss" instead of "Untersuchungs ausschuss." The trailing space is suppressed by the suppression character. You will appreciate this flexibility when and if you need it.

Abbreviator ST does have a couple of nasty bugs. The test machine had TOS 1.0, and the program was in version 1.1, so these may not affect you. In the program's control panel, clicking the 'Info' button displays the info box which says "Click anywhere to continue." No amount of clicking has any effect—rebooting is the only option. The second bug is more likely to lead to lost work. While naming an abbreviation, typing an underscore (_) either hangs the machine (with bombs) or resets the computer, depending on the application program you are running. Beware of these.

Abbreviator ST comes on a single-sided disk and runs on ST, STe and TT series computers. The accompanying ten-page, bound manual is well written and concisely takes the user through all of Abbreviator ST's features and controls. A registration card is also included in the package.



```
Atari Interface Magazine␍3487 Braeburn Circle␍
Ann Arbor, MI 48108␍
```

All in all, Abbreviator ST performs as advertised—efficiently and transparently. For the light user, $19.95 to expand the occasional abbreviation will be a bit much to spend. For people who do a lot of repetitive typing, however, Abbreviator ST is an invaluable tool.

The possibilities in database use, invoicing, form letters, and many other applications are limitless. Abbreviator ST may be just what you've been looking for.

BUY THE BEST!

☛ Ever get the impression that everyone's trying to be "as good as Toad?" Why settle for an imitation?! Our Hoppy Holidays Sale is just for you — so you can buy the best at the best price too! No other company offers a two year warranty on all their hard drive products, has a recognized and competent technical staff, and can honestly say they plan on *being around* in two years! What good is a lowball price if the company can't stand behind the product? Let us show you how much better a good company can make a good hard drive! *(Don't forget the free fruitcake, too!)*

- **FAST & FREE Shipping**

MONITORS!

☛ The Atari ST's have always been finicky about monitors. With a seemingly endless array of color monitors on the market (at reasonable prices, too), why should we be bound to Atari brand color monitors? That's a good question. The answer is that the Atari uses *analog* RGB and until very recently, *TTL (digital)* RGB was the norm. Now that the analog systems of VGA and Super VGA are more popular, analog RGB monitors are more popular too. So you'd think the problem would be solved. Lo, a quandary still exists. Now, the mainstream monitors are too fast for the Atari's to use! Most VGA and Super VGA monitors have a fixed horizontal scan rate of 31.5KHz, and the Atari runs at 15.75KHz. So, while the RGB standard has changed in our favor, the speed issue is still boxing us in. When you boil all this down, you get a relatively small set of monitors which will actually work on an ST. This set includes the Atari SC1224 (12") and SC1435 (14") monitors, a few "multisync" monitors (which have the ability to lower their horizontal sync rate to 15.75KHz), and the handful of monitors that, for whatever reason, were made with compatible specifications. We sell them all. If you like being stuck with the Atari name brand monitors, that's cool — we have them. We also have great deals on multisync and other compatible monitors, like the Magnavox 1CM135 and our own refurbished *Toad-RGB* color monitors. With your new-found monitor knowledge, examine our offerings and buy what you need – now, while they're on sale!! And if you want to wax philosophic, call us!

The "Toad RGB" Display

☛ When we see a good deal, we don't pass it up. So when we were offered the chance to sell some excellent color monitors, which just happened to work on the ST, we jumped right on the opportunity. The truly spectacular thing about the monitors (excepting the price) is that they support ***three*** kinds of inputs! It's got an ST compatible *analog RGB* port, a PC-CGA compatible *TTL digital RGB* port, and a *composite video* input with separate chroma and luma too! Ponder it: using the same monitor on your ST, a PC compatible and an Atari Eight Bit or VCR! It even has an audio input and speaker! The monitor has a beautiful glossy twelve-inch screen and a picture quality which surpasses even the best SC1224 monitors! The monitors are reconditioned (but are factory fresh), so we know how they work, and that means that we can offer a complete (parts & labor) six month warranty! The quantity is limited though, so order yours ***toaday!*** Please specify ST, Eight Bit, PC, or Cray X-MP connection cable.

Toad's Special Holiday Sale Program Pick of the Moment

M.O.S. Disk Utilities

☛ This new program from newcomer Maximum Output Software will do darn near anything to repair or optimize your hard disk. Is your hard drive slowing down because files are becoming fragmented? Scared and confused because your FAT table is mysteriously corrupted? Boot sector blues? Too many sectors in the fast track? Need a break from endless seeking? Having trouble separating the good from the bad? Confused about the origin of frozen dinners? You need **M.O.S. Disk Utilities.** This program is the best hard disk utilities package on the market today. Includes a 100% efficient defragmenter, FAT, file, and directory repair programs, hard disk tester, bad sector enhancer, and more! Will run on any ST or TT computer and hard disk! Introductory offer.

☛ Buy Now! Only $49!

What You Want Is What You NEED!

1. **NEW "TOAD–DENSITY"** — High Density Floppy Drive Upgrade Kit for TT030, Mega STE, and 520/1040STE. Everything you need to read and write 1.44MB floppies. Comes with enhancement and HD drive mechanism. Fits cosmetically into all aforementioned computers.
   Mega STE/TT – $99 520/1040STE – $169
2. **NEW DC DATA DIET** — Realtime File Compression Utility. Capable of increasing hard disk capacity by up to 50%. This is by far the most popular program we've had in 1991. "Everything seems to work just fine." – Andrzej Wrotniak And so there you go. **ONLY $39! In Stock Now!**
3. **LEGENDARY SPECTRE GCR** — The Best Mac Emulator. That's right boys and girls, the world of Macintosh can be yours with any ST or TT computer. This fine emulator from hacker and mystic Dave Small makes the Mac Classic look like a tricycle. **ONLY $219! MAC 128K ROMS – $300!**
4. **LEMMINGS** — Dare I say this is a yuppie simulator? I hate games, but I love this one. Thousands of little mindless creatures must be saved from the sweaty palm of conformity and you're just the management consultant to do it. Who cares if you lose a few in the process? And if you screw up, nuke 'em with a clean conscience! **ONLY $35!**
5. **ATARI SX212 Modem** — 1200 Baud Hayes Compatible Modem from Atari. Works on ST or Eight Bit. Eight Bit Cable & Software Package – $19. **SX212 MODEM ONLY $29!**

Informer II

S. Michael Hallack

Informer II is a database program by Soft-Aware that attempts to walk the tenuous line between power and ease, while still weighing in at a bantam price of under $100.

Setting up the database was fairly intuitive. All that was necessary was to select the add column function and then be prepared for the barrage of different formatting functions that appear. Strict numeric only fields took a little getting used to, but the program gives you error messages explaining what you did wrong until you get Informer II's format correct. This can be frustrating, but it is certainly a welcome relief to programs that do not understand what the user is trying to do, and give no indication anything is wrong.

Once the columns have been created on the "list"—the main spreadsheet type screen—clicking on any of the cells switches the display to the "form" level. This is where all data entry is performed. This screen displays one field from each column in the main list. The fields on the form can be moved about, expanded or shrunk with simple point and click operations.

The structure of Informer II is based upon this relationship of the compact list (which shows a brief overview of all of the fields and records) to the form (which displays a fully formatted single record and all of its fields).

It is no wonder, then, that the principal Find function it uses is based upon the list. More specifically, it uses a "sublist." The sublist is created by giving the program a list of "fields" and "qualifiers." The screen on which this is done does have a lot of helpful information written in all of its nooks and crannies, but it is still quite daunting.

The sublist is just like the list, except that it only contains the records that you searched for. Once it has been formed, it can be toggled back and forth with the main list by simply clicking on a shaded box in the upper left corner of the

Informer II tries to be both powerful and friendly. Unfortunately, it does not totally succeed on either attempt.

screen. This box also contains the number of records in either the list or sublist. I found it convenient that all the records contained in the sublist are also highlighted on the main list.

The data entry is quick and painless except for one problem with fields containing multiple lines. When moving between fields, the RETURN key or arrow keys are used, but to move between lines in a single field the TAB key must be pressed.

This is not a problem in and of itself, however. The last position you type on on one of these lines will *always* be the position that the cursor returns to when you enter this field a second time. So, if you intend to change data in multiple line fields frequently, you will have to use the mouse rather than the keyboard to quickly get to the right position.

Another annoyance is the necessity of entering the "key number" for each and every record. It simply doesn't make sense that the computer will not automatically number the records.

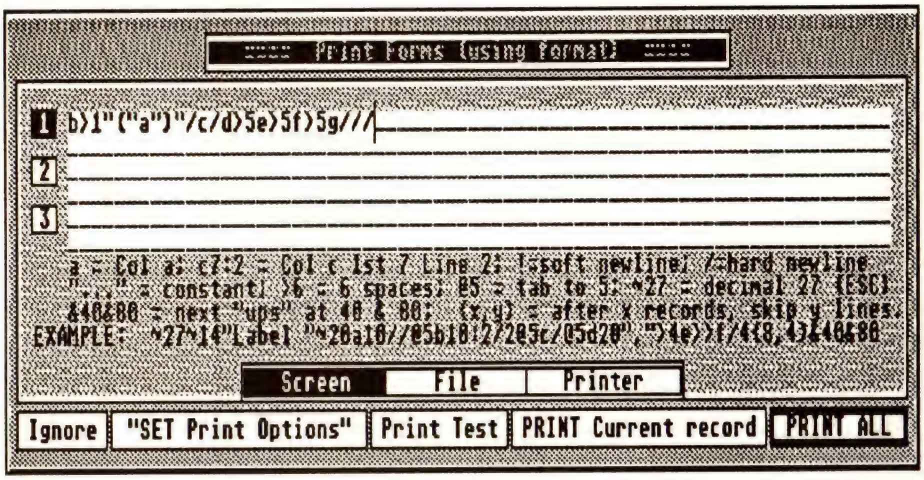
One of the more unique features of Informer II, the ability to display Degas and Neochrome pictures inside fields of a form, suffers from a technical problem. It just takes too long to load the picture in and size it correctly to the field. Each time it loads the picture, you are treated to a mind-numbing pause that is really inexcusable.

The problem arises because Informer II does not save the graphics as they appear in your database. It always accesses the picture data in its original raw format and therefore loads *and* figures out how to display the picture in a particular field every time you desire to view it.

The instruction manual, while being thick and fairly complete, was very difficult to read. Not only were the pages poorly photocopied, but the text itself was incredibly small. If you do not wear glasses now, you might need to after reading this manual!

The writing was fairly clear and helpful, but the layout was unnerving. The most obvious blunder was that installation was not covered until chapter eight. The index was of little use also—when I had a problem with printing, I found that 38 pages referenced the word "PRINT" while another 29 pages contained the word "PRINTING." It might take less time to re-read the entire manual than to look all of these up.

Also, the manual is numbered by chapter and not by page alone. The index is numbered by page alone, so that even if you might have enough time to



```
b>1"("a")"/c/d>5e>5f>5g///
```

```
  a = Col a; c7:2 = Col c 1st 7 Line 2; !=soft newline; /=hard newline
  "..." = constant; >6 = 6 spaces; @5 = tab to 5; ^27 = decimal 27 (ESC)
  &40&80 = next "ups" at 40 & 80;  (x,y) = after x records, skip y lines.
EXAMPLE:  ^27^14"Label "^20a10//@5b10!2/2@5c/@5d20","">4e>>f/4(8,4)&40&80
```

look all of these pages up, you would still be unable to find them.

Informer II also offers help in the way of help screens and tutorials. To be honest, I didn't do any of the tutorials— they all looked long, boring and not very indicative of a program that is supposed to be intuitive. I did use the help screens and found they were quite helpful, although they are stored as full 32K DEGAS pictures and thus take up a lot more disk space than was necessary.

I have a few misgivings about the printing functions. The five main printer functions are divided into three different forms. Three of these functions are 9-pin Epson compatible screen dumps. These are referred to by the manual as the "Graphic" printouts.

My Panasonic 24-pin printer prints out something "Graphic," and I might say something "Graphic" about the poor job it does, but it certainly does not represent the "Graphic" display that is on the screen. The authors regrettably did not include any sort of printer drivers, so if your printer is not a 9-pin Epson compatible, you will be unable to use over *half* of the printing options that are available.

In fact, each of these three printing functions simply rearrange the screen and then perform the ALT-HELP screen dump built into every ST. Because these use the standard screen dump, they are not affected by any of the printer option screens found in Informer II.

The Forms printing option uses a standard ASCII dump and therefore can be used with a much wider range of printers and with all of the printing options. Using different formulae in each of the available print form slots, you can design your own printout. It works well, even though it is not very intuitive and complains a lot when you do not follow Informer's conventions closely. Unfortunately, I was hoping for some way to print in the same form as the data appears on screen without the hassle associated with the graphic printouts or designing printing formulae.

The last printing method, report printing, uses the table list rather than the individual forms. It prints a fairly accurate representation of the on-screen tables.

Informer II does provide a convenient way to upgrade from other databases. A conversion program is included for Datamanager ST, DB Master One and Habaview files. One of our STargroup members loaned a video tape Datamanager ST database to me, so I was able to test this feature out. Informer II translated this database very quickly and easily. Nothing seemed out of place, except for two of the records that had their titles switched!

Overall, Informer II tries to be both powerful and friendly. Unfortunately, it does not totally succeed on either attempt. Its use for serious business purposes is called into question by its horrid printing functions and the limitations of a database that cannot expand beyond the amount of RAM memory.

The use of the lists, sublists and forms makes it more intuitive, but some of the screens used inbetween these functions are overwhelming. If the manual gave any help, this would be forgivable, but the instruction book happens to be the worst aspect of Informer.

However, for its price range, Informer II may still be very appealing to ST users who own one of the earlier database programs and needs the conversion utilities. Instead, I am looking forward to Informer III!

For ST, MEGA, STE and MEGA STE/TT

MEMORY:

520/1040ST - MEGA

NEW LOWER PRICES!!!

All 2MB - $179, 4 MB $249
1 MB (520ST) - $129

Above prices are complete with DRAM, tested , 1 year warranty.

Solderless installation, perfect fit under metal shield, shock proof through detachable metal clip, 4 unique designs to cover different mother board versions, not a "one fits all" approach! Read ST Informer April And May report: A superior design with better docs and utilities!

Clock Option on Memor Board	$30
Stand-alone CLOCK	$38

Send in your 520STfm for an upgrade to ONE Megabyte complete with installation and test for only $99

EXPANDABLE Hard Drive Kits

come complete with software and all parts needed to get the system operational, 1 year ltd. warranty. Four different case styles with various drive mechanisms are available. see catalog for detailed listing:

1. Tower Type, 10" w x 6.8" h x 15" d, with 150 W PC power supply w/fan, room for up to 5 half height hard drives or combination full/half height, our most expandable case

330 MB, full height reliability/performance $1295

2. Monitor Style, 13.25" wide (same as MEGA) x 15" d x 3.8" h, ready for up to three 1/2 ht or 1 each full/half ht. hard/tape/floppy drives, 55 W power supply with 115V fan, - can be placed under monitor or at side of your desk.

M44SQ SYQUEST 44 MB + 1 cartridge $549

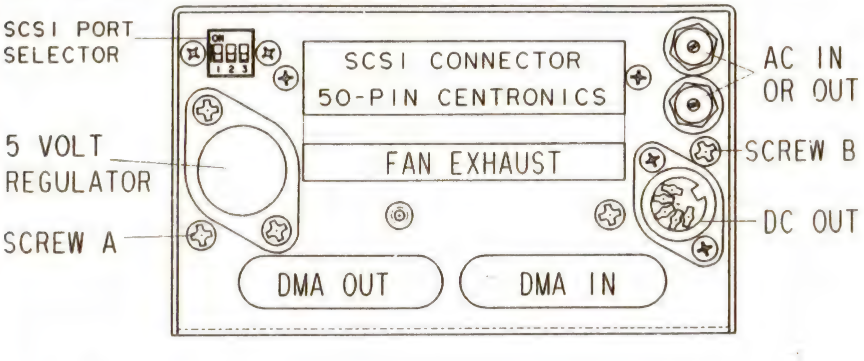
3. Desktop Style, 4.5" w x 6" h x 13" d, ready for 2 half height or 1 full height drive. 55 W power supply, fan optional

D84SC 84 MB 24 ms $499

4. Modular Case, only 4.8" w x 2.8" h x 7" deep, fan, air filter and shock mounts standard. Small size/low weight, DMA thru, SCSI connector and selector switch make data on this drive very transportable and you don't need a second drive of the same kind at the other end!

M49SC 49 MB 28 ms $399

Drawing shows connection options on back of Modular Case:



TOWER COMBO:

Why emulate if cou can have the real thing!

Our new case line allows you to install **both**, ATARI and PC - complete with expansion bus, back to back into a tower case measuring 9.5" w x 19" h x 16" deep. Both mother boards are completely accessible for service and install independently, allowing you to upgrade in small steps at your convenience.

There is currently room for up to three 5.25" and at least four 3.5" drives. Additional drive slots can be built in as an option if ever necessary. Other Peripherals like modems can be integrated as well.

A 230 W power supply will support all these options.

Power users will want to use one monitor for each CPU, something you can"t do without additional hardware on an emulator. Alternatively you might use an optional front operated monitor switch with one multisync monitor.

The icing on the cake is an optional high speed bus interface that makes peripherals (hard and floppy drives for example) and other resources like memory available to both machines in a transparent way. You might use only 1 set of drives, resulting in significant cost savings. There is not enough room here but our catalog will give you examples on how to beat emulator cost and performance hands down.

Modular design allows us to offer this case for **all current ATARI** models, from the oldest 520ST to the MEGA STE/TT.

On the PC side everything will fit, starting at the bottom with a 12 MHz AT right up to a 50 MHz 486 mother board as the current top end.

All case kits come with parts to install a standard machine as originally supplied by ATARI. Optionally brackets and cable sets take care of most popular add-ons.

Complete kit for std. machine $295
Please supply machine type with order.

Already announced products making it finally into manufacturing:

CPU expansion board, gives ST models MEGA expansion port + clock and blitter socket where missing. Spring loaded contacts and two metal latches allow quick installation/removal. Priced between $79 - 99 depending on machine type. Also needed to install upcoming 68020 board (target price under $400).

Our High Density floppy controller consists of a small (2.2"l x 0.8" w x 0.3" h, no bulky cabling - and should fit into all machines. $69

Low priced Host Adapter, part #HA1, priced at $69

CPU CASES:

Upgrade 520/1040 to the MEGA standard.

- Separate CPU and keyboard, gain space for three each 3.5"/5.25" floppy, hard or tape drives in two separate drive bays. Full height drives will also fit.
- A 150 W power supply with fan provides power for all possible combinations and keeps everything cool
- Reset button on keyboard
- A delay circuit allows fully automatic HD power-up.
- Monitor can be switched on/off with CPU, using an optional cable.
- Our kit uses a steel case 18" wide x 12" deep x 8" high, easily strong enough to support a high resolution monitor.
- The original keyboard gets a low profile enclosure, 18.7" wide x 7" deep x 2" high, consisting of a metal bottom part and the modified plastic top of the original case, supplied as exchange or you do the modification your self. The kit comes preassembled and installs without soldering. All mounting kits, wire harnesses and connectors to modify a standard machine are included.

Complete kit, please specify your machine type $249

OPTIONS:

Hard Drive kits for the CPU case consist of host adapter, support bracket, DC harness and SCSI cable with standard CENTRONICS 50 SCSI out. These kits might also be used with customer supplied case/power supplies. drives. Additional connectors $8 installed.

C0S No Drive, install your own emb. SCSI drive $99
49 MB - $349, 84MB - $429, 105 MB - $499 Kits fit also TOWER COMBO. See catalog for more options.

KEYBOARD KITS only as used on our CPU cases consisting of metal bottom, connecting cable with reset and modified plastic tops on an exchange basis are available separately for $69, please specify your machine type.

New product currently in design:

New network board that will give users of older machines all MEGA STE/TT communication ports. Compatible with software already on the market, pricing should be under $200.

Space limitations don't allow a more detailed descriptions. For complete 40 page catalog + addendum contact:

Atari—Suits and Ties at COMDEX

Irwin Brooks
LACE

In comparing last year's Atari COMDEX presence with this year's, I would have to give the Atari group a much improved score.

(all rights reserved)

Las Vegas, NV

The biggest computer show in the United States is the Fall COMDEX Convention/Exhibition held in Las Vegas, Nevada. This year, the October 21-25 show drew an estimated 135,000 people. A "disappointingly" small increase of only 10,000 more than last year blamed on our "economic slump."

The COMDEX Convention is the largest convention that Las Vegas hosts. This year, hotels were sold out months before the show, requiring last minute travelers to commute from up to 90 miles away! The traffic and crowds were incredible.

The convention is so large that it overflows both of the largest convention centers, the Sands Expo and the Las Vegas Convention Centers. The overflow went into three large hotel/casinos—Ballys, Riveria and Mirage.

Understanding that most of the show centered around the IBM PC and compatibles, exhibits were still quite varied. There were hardware demonstration that boggle the mind. Voice recognition command systems; every size, shape and capacity of Winchester hard drives; CDROM drives; and read/rewritable removable optical drives were offered by several manufacturers.

Printers and plotters in multi-color, laser and thermal transfer types were everywhere. All types of scanners, monitors (including the new flat color LCD screen type), modems, specialized interfaces and accessories, and anything you can think of for computers was somewhere at COMDEX in the 50-plus miles of display booths.

Don't be confused, this article is really about Atari. However, understanding and appreciating the magnitude and variety of COMDEX adds to comprehension of the remainder of this article.

Atari's Booth

Atari was at COMDEX in force again this year, just like last year. In fact, they had the same location with a very similar booth layout and setup display area. But, let me tell you, the atmosphere and displays were far different. Yes, there were a few of the same companies displaying our same beloved products, but only if the products were high-end.

Atari employees and all Atari exhibitors wore suits and ties. Even the musicians demonstrating their MIDI products—who normally sport uncontrolled long hair styles—had on suits, with their hair pulled neatly back (remarkable). Maybe that was not so unusual after all, since the focus of the Atari exhibit was professional applications.

A real nice touch at this year's Atari booth was a presentation stage used to demonstrate Atari and other developer products. Very professional and informative presentations were conducted on the easy-to-see, large (~30 inch) color monitor connected to a TT030 computer. Comfortable seating was provided for an audience of about twenty, with demonstrations of one kind or another conducted on the hour all day, every day of COMDEX.

ABC PC Compatibles

In the hardware arena, Atari displayed the long rumored IBM PC compatible computers, their ABC line that has actually been available in Canada and overseas for some time.

The Atari ABC PCs are available in three different configurations. The most powerful is the ABC DXII, which is a true 80386DX PC with math coprocessor running at a fast 40 MHz. Next in the line is the ABC SXII, based on an 80386 SX CPU running at a respectable 20 MHz.

And lastly, the Atari ABC NSX is a notebook-style mono LCD 386SX PC

Want to get the most from your Atari investment?

Subscribe to *Atari Explorer*, the Official Atari Journal! Each issue of *Atari Explorer* is filled with reviews, tutorials, hints, and late-breaking news to help you keep pace with the fast-changing world of Atari products! And *Explorer* is the only Atari magazine that covers the full range of Atari equipment — from the exciting ST and TT computers, to the 8-bit home computers, to the amazing Portfolio palmtop MS/DOS computer and the Lynx Portable Entertainment System — so whatever Atari you own, you'll always find something new, relevant, and exciting in our pages!

Six issues of *Atari Explorer* are only $14.95 — a savings of 15% off newsstand price! That's a small investment that pays BIG dividends, when it comes to getting the most from your Atari! Alamo Area Atari User Association (AAAUA), P.O. Box 79-1426, San Antonio, TX 78279-1426

Presidential Ponderings

Well, our annual elections have come and gone. There really were no big surprises as each office had only one nominee and there were no nominations from the floor. Of the seven elected officers, three are new. This is good as it provides an orderly transition for the Board of Officers as a group. It turns out that I am among those who will be remaining for another term. I want to thank the AAAUA membership for their support over the past year and I am confident that I will get no less for the coming year. I am looking forward to the new year and to working with the new board. There is much to be done and with the fresh blood and energy, AAAUA should have a great year. Following are the results of our November elections:

President Alvan Sherrill
Vice President Billy Washburn
Secretary Paul Hitzfelder (New)
Treasurer Mike Lively (New)
P.D. Disk Librarian Russell Gibson
Public Relations Larry Allen (New)
Newsletter Editor Manuel Garcia

First, I want to congratulate and welcome our new officers, and thank them for volunteering to accept the responsibilities of their respective offices. I am confident they all will competently carry out their duties in full measure.

I also want to warmly thank the outgoing officers. Sheila Kepner served in an outstanding manner as Secretary, keeping detailed records of both General and Board meetings. Joe Barth did a commendable job as Treasurer maintaining accurate records of our financial status and keeping a keen eye on expenditures and receipts. Bruce Davisson served well as Public Relations Officer, seeing that meeting notices were placed in local publications. Unfortunately, Bruce was unable to complete his term of office due to personal commitments.

Although these members are leaving their officer positions, I am pleased that they all are continuing their membership in AAAUA. My thanks to these officers, as well as to the re-elected officers for their dedication and commitment throughout the past year. The new Board now will be energetically planning user group activities for the coming year. I ask for the support of all members.

ACCT

The November meeting of ACCT came to order at the home of the Micka's. Our Prez, Dave, physically took a corrected mailing list to the door of AIM publishers. Hopefully everyone will get their AIM now. The people who have not been receiving AIM will be compensated in March when they renew their dues.

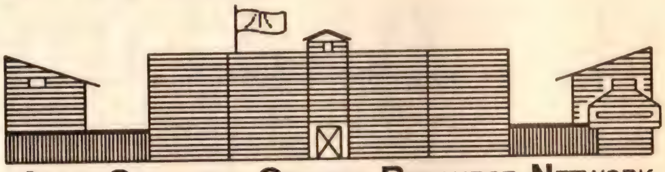
Unfortunately those who missed the last few issues also missed articles by an ACCT member Ellen Lentz. Ellen Lentz is a former ACCT president. Her expertise is the 8-bit computers. Ellen's articles impressed David Richardson, author of a manual and developer of over a hundred fonts for Daisy Dot III. Mr. Richardson requested Ellen to write a review of his manual that he sent her.

Ellen also brought in a video tape that someone had sent her. It consists of samples of video titling, based on an articles she had written on Video Titler.

We will expect a review of the Chicago Atari show from Roy Sidner, who plans to attend. Roy also has a manual maker program for the ST.

Brian, our PD Connection, came to the meeting with six disk filled. Our disk librarian, Brenda, cautiously checked them for viruses. Several were found to be infected. Remember, you can never be too careful. Brenda intends to sort through the files and make them available next meeting.

Next meeting is Wednesday, December 4, 7:00 at the home of the Mickas'. Call if you need directions. Expect a call on the Christmas party!



ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

Notes from the November meeting: Digitizers were the topic for the November meeting. Karl Fadus demonstrated an audio digitizer and kept the group amused with choice sound bytes from "Young Frankenstein." Rob Magdich demonstrated VIDI ST by taking digitized pictures of members with the help of a camcorder. Mike Surface demonstrated the two games: "Tycoon" and "Life and Death."

Eric thanked those that helped at the Indiana Computer Educator's (ICE) Kids Conference and reminded everyone of Pentacon and the plans to attend the Chicago Computer-Fest. Kim Stahn had tickets for the Computerfest for sale.

Just a reminder that the January meeting will be the election of officers for 1992 and our annual Gamefest. Come join in the fun at the Shawnee branch library.

Notes from ICE: The third annual ICE Kids Conference went well and ACORN participated by setting up two rooms for the kids to enjoy. Each year, local educators set aside a Saturday to invite hundreds of middle school kids to get some hands-on experience with computers.

Most of the rooms there were set up by the teachers using computers borrowed from around the school district (mostly Apple IIGSs and Macintoshes). We brought nine STs and used four for MIDI Maze (always a favorite with the kids). Rob Magdich digitized pictures of the kids with VIDI ST and Mike Surface used some of the digitized pictures to make wanted posters of the kids using a desktop publishing program and an Atari laser printer. Karl Fadus had his Spectre GCR showing how an ST can run Mac software.

Sweetwater Music had a room demonstrating a studio quality MIDI music setup (with a Mac) but we had or own MIDI music set up with equipment that about any musician could afford. It was also used to demo educational software and a couple of games. The last ST was used to demonstrate the BBS.

The only other user group participating this year was the local Mac user group. Probably 95 percent of the computers there this year were Apple computers. I didn't get a chance to visit all the rooms that were set up but, based on the handout provided to the kids, few people from outside the school system were demonstrating. Only a couple of the local businesses were there. Only a handful of MS-DOS machines were there.

Thanks again to all that participated.

BRAG ST

Buffalo Region Atari Group for ST's

Minutes of General Meeting—October 17, 1991

The October meeting was called to order at 7:30 PM by Gerry Genson and Joe Rogozinski, Chairman Mark Pierro could not be present for this evening's meeting. There were 15 members present.

The first order of business was club announcements and a review of the AIM Disk of the Month. Then we proceeded to call for nominations for four Board of Directors as called for by the club's Constitution and Bylaws. The four nominees were: Carl Barron, Harv Hontz, Mike Leskow, and Lou Krueger. Elections will be at next month's meeting.

The meeting continued with demos of TV Sports Football and Touchdown Football by Gerry Genson and Hunt for Red October by Dane Stegman, followed by the raffle and door prize drawings, which were won by Gerry Genson and Dave Ryznar respectively. The rest of the meeting was an open forum and concluded at 9:30 pm.

Cuyahoga Valley Atari Computer Club

C.V.A.C.C.

ATARI®

The officers for the C.V.A.C.C. for 1992 are

President	Jon Goshorn	(216) 494-0738
16-bit VP	Bud White	(216) 848-3856
8-bit VP	Sonny Burgess	(216) 454-6036
Treasurer	Ron Mullens	(216) 794-1990
General Sec'tary	Jim Woodford	(216) 753-5689
P.R. Secretary	Terry Russell	(216) 762-5518

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM monthly magazine, access to the 8-Bit and ST club libraries, monthly meetings, monthly AIM public domain disks, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 South 2275 West, Roy, UT 84067.

Your elected 1991 L.A.C.E. Club Officers are:

Mike Russel	President	(801)546-0707
Doug Hansen	Vice President	(801)393-6849
Ken Karchner	Secretary/Treasurer	(801)776-8015
Richard Clark	8-Bit Librarian	(801)825-5823
Kelly Knecht	ST Librarian	(801)773-5652
Irwin Brooks	Pub. Coordinator	(801)731-1516

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7 PM. Mark your calendars for the next three meetings: January 8, 1992 February 12, 1992 March 11, 1992.

MACE

Time now to tune in to the MACE channel. Last month's theme was Education. Our leader (Ted) started off the meeting by putting a last call on positions in MACE not already filled. The last positions to be filled were vice-president and treasurer.

After the officer positions were finalized, our president made this wild offer—"If people read about PD or Shareware software and want to order, we will be happy to order for them, and we will pay the shipping charges!"

My thought on this at the moment were, "If everybody ordered one disk of PD software, we could be into this for a mint!" One of the club members wondered if an ad he had seen would qualify. Ted answered, "If you bring in the advertisement and tell us what you want to order, we will be happy to do it."

Then he explained how MACE would benefit from all the new software that would be available from the people who order. MACE would have a copy of it, and we could provide all members with the ability to purchase it themselves. He also mentioned purchase price (of PD software disks) comparable to our prices on AIM and MACE disks. Thinking about everyone getting one disk apiece was still spiraling around in my head.

Participation

The president also announced the participation raffle running from October 1991 until the MACE birthday meeting in May 1992. Details and rules were reported in last month's Journal (there are still a few copies of it left).

One rule has changed—members introducing a new member get five (5) tickets! (Bring your friends, they don't have to own an Atari to join and if they win the raffle they'll have enough to buy one.)

Remember, renewing your membership gets you a ticket and you can renew early. So if your membership expires anywhere in June through September '92, renew now, get your ticket and you'll be set until June-September '93.

You can also get tickets for buying three disks from our 8-bit and 16-bit software libraries, plus you still get the fourth disk free! I know we have enough 8-bit disks to allow you to corner the market on raffle tickets and we are always increasing our 16-bit library (I saw some great pictures on one of our latest 16-bit MACE disks). Submissions to either library could also earn you one or more tickets depending on quality of material.

The grand prize is a certificate for $500.00 and there will be lesser prizes awarded. You say to yourself "I have to work that day and I can't be there." No problem, you need not be present to win. If your number is called, you'll have the ticket stub to be able to pick up the prize—at the next club meeting if you wish. Winners will be posted in the MACE Journal and on the MACE Forest (BBS). One last thing, submissions to the MACE Journal are worth tickets (the better the article the more you score!).

The Demo

After the announcements, the meeting broke up into 'demo areas'. Software was being shown off the AIM disks (8-bit and 16-bit). Kid Publisher (16-bit) was also being shown at the meeting. Kid Publisher is a desktop publishing program without all the complexities that make up professional packages like Pagestream or Calamus. Mostly for youngsters, Kid Publisher is easy to use, and kids learn how desktop publishing works from concept to printout.

Remote Atari

I saw postings for BBSes on the wall at the meeting which I will print here—MACE Forest (313) 278-6966 300-2400 baud, Adventure Line (313) 445-1313 300/1200 baud, Rambo HQ (313) 422-0978 2400 baud.

In early November, I visited the home of the operator of the MACE Forest and will be writing about his bulletin board and his computer hardware. I was impressed by his setup with three 8-bit computers, floppy and hard drives, monitor and printers all tied together to work in unison. Call in sometime; these bulletin boards have information about Atari (and other computers) and about MACE. Call them day or night, they run 24 hours a day.

The Near Future

Late breaking news—MACE is organizing a presentation of Atari Computers at the Southland Mall. Things to show off at the mall include:

A MidiMaze tournament (16 players per game) with hopefully a prize for the winner.

Demonstration areas for Entertainment, MIDI/music, Business applications and Education.

Information area to pass out Atari and MACE related info.

A Live MIDI demonstration.

The presentation could probably happen in Feburary. I will keep you posted as to the dates and times.

Middle Georgia Atari Users Group

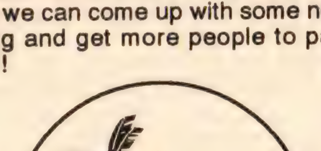
M.G.A.U.G.

The Middle Georgia Atari Users Group is the sole Atari club in the Middle GA Area. We are composed of 40 ST members. MGAUG meets the second Sunday of each month at 1 PM at the Warner Robins Library. Annual dues are $6 with an optional newsletter. The AIM disk of the month, AtariUser Magazine, and Public Domain Library are FREE to paid members.

The monthly meeting took place on November 10 with a fairly good turnout. Mainly we had some great discussions on the Atari and the computer world in general. We also had a large number of used ST programs for sale at the meeting.

It appears that we will have a new President of the club soon. Jeff Vincent has said that he would like to give it a try. Jeff and I will be starting the transition next month. After five years, I am quite ready to hand over the torch. Hopefully with a new president leading us we can come up with some new ideas to get the club going and get more people to participate. GOOD LUCK JEFF!

O-ACEs



At our regular November meeting, we elected a new slate of officers for O-ACES. Here they are:

President	Peter Killian
Vice President	Todd Magee
ST Librarian	Mike ("Shane") Yarborough
8-bit Librarian	Bill Zimmerman

Our next meeting (December 11) will be the first of what we hope will be many more holiday parties. The new club officers will make plans and set it all up. After the popularity of our last swap meet, we decided to have them more often - the next one will be held in February 1992. We also discussed a different name for the club: "GO-ACES" (for the Greater Omaha - Atari Computer Enthusiasts) was suggested. Those present decided they like our current name just fine. Finally, we discussed having refreshments during our regular meetings and decided that members could bring their own, but the club would not provide any for the time being.

Our new president will be attending the Chicago Atari show later this month and will file a report afterwards. Things are starting to look up a bit in the Atari market and we hope to do our part and build our own form of excitement in Omaha. Till next time, Peter Killian

The Prez Sez by Rick Reaser

Another club year will be at a close by the time you receive this and hopefully, we will have elected a new slate of officers. For those of you who haven't heard, I will be leaving the area this summer for Air Command and Staff College. From there, who knows where I'll be heading. Los Angeles, I hope. We members of the military have to keep on moving. First Dave Koster, now me.

I enjoyed being a part of the club these past few years and will continue to stay involved until the moving van comes this June. We have great members that are always willing to go that extra mile to help a friend or stranger to the world of Atari. That's special and I hope it stays that way.

In other news, the club purchased a color monitor for our ST, so now we have a complete ST set-up and won't have to rely on members to bring their monitors. The club's equipment is also available for short term loan to members in case of emergency breakdowns at home. We have a host of 8-bit equipment as well.

We plan to have a club BBS up this coming year, courtesy of Sam Cherry's efforts and determination. We're working out the details which should be available soon. Our current BBS home, Wildcat Orphanage has some new features for ST users that are interesting. Be sure to check it out at 392-6632.

The November 8-bit SIG was a lengthy demonstration of the new 3-Dimensional Surface Modeling System, ChromaCAD. The demonstration was loosely based on my recent review of the program which will appear in the December edition of Current Notes. Ben Poehland, the Current Notes 8-bit Editor and Alchemist, provided me with a copy of the program and the opportunity. ChromaCAD is extremely powerful and clever, but requires a lot of time investment to master. It is written in Forth, like Rambrandt so it isn't compatible with Atari DOS. There have been advertisements for ChromaCAD here in AIM which are quite informative. I also demoed the Alchemist's Super Video II upgrade to my 800XL. On a sad note, Ben Poehland's house caught on fire and he is resigning his post at Current Notes.

At the October ST SIG, Terry Quinn and John Peters demonstrated several "Load Pactors" including the latest offerings from Double Click. I spent most of the meeting rebuilding the RS-232 cable for one of our loaner modems, so that one of our STers could check it out. From what I caught of the meeting, as usual, it was a pretty good turn out and fun was had by all. See you at the next SIG meeting.

PHAST

The November general meeting was held on Saturday, Nov. 9th. Attendance was about average (around 15 people). Our current membership is twenty-seven. We dropped four members from the rolls due to non-renewal, but we had five new members as well as a renewal.

Major business conducted was nomination of officers, which were all filled. And the nominees are:

President	Michael Aubrey
Vice President	Brien King
Rec. Secretary	Wayne Myers (reluctantly)
Treasurer	Wayne Myers (enthusiastically)
Mem. Secretary	Mike Zachary
Sgt. at Arms	Adam Ceton

Elections will be held on Saturday, December 14. Most of the meeting was taken up with demos and other presentations on Adam Ceton's STe, as our club computer failed to perform.

RACC

ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

Business meetings are held at the Springbrook Congregational Church at the corner of Springbrook and Spring Creek Road, just east of Alpine Road, Rockford, IL. We meet from 9:00 to noon every third Saturday of the month.

Our new mailing address is RACC, 5430 N. 2nd Street, Loves Park, IL 61111.

President	Cal Schafer (815) 633-1259
ST VP	Dennis Renner
8-bit VP	George Luhman
Secretary	Mike Ritter
Treasurer	Thom Lofthouse
News. Editor	Ray Smith

Due to economic conditions our newsletter has been unpublished for some time. To find a job, our newsletter editor has been forced to move a couple of times. Last meeting, we determined that only three people were reasonably certain of their job, and 80% were or were about to be unemployed. And now, even IBM is laying off another 20,000, so we Atari people should not be dis-heartened.

RACC participated in the Chicago Computerfest with LCACE by promoting the NEWELL enhancements for the 8-bit and 16-bit computers. With help from TEAC, The Educator's Atari Club from California, we also promoted their new catalog and programs. We showed these working on both the 8-bit and ST computer using the Xformer.

Dennis Renner also showed Data Perfect using the ST. Now, you can talk about your powerful databases and then you can do it this way and really have a lighning fast operation. We had Leo of LJK right next to us. We had a lot of fun, and I am so happy to have met this fine gentleman. I gave a seminar on Printer Control. And we had Atari Writer Plus up and running in 80 columns for all to see and compare with other 80-column word processors. I had the screws removed from my 800 XL with 1 meg of memory, RAMROD, OMNIMON and OMNIVIEW for all to see how these all look and work together, by simply lifting the keyboard.

Sincerely,
H. Jake Olbrich

R.A.C.E.

Pres.	Lewis Midyette	(919) 828-4319
Vice Pres.	Eric Schofield	851-5134
Secretary	Don Nelson	942-2764
St Librarian	Tony Manino	851-8092
8-bit Librarian	Arthur Katz	881-0247
Treasurer	Robert Yates	552-7053
BBS SYSOP	Robert Yates	552-7053
Galaxy BBS		552-0974

Well gang Christmas has passed us by, and it is a new year. I hope all of you got just what you wanted. I also hope you haven't promised your life away with New Year's resolutions. Some of you might make crazy resolutions like spending less time on GEnie, CompuServe or Delphi. While others will be getting up at the crack of dawn to put on that new, sweet suit you got for Christmas, just to fall back asleep because you were up till 3AM breaking your other half dozen promises.

I feel this year will be a good one for the group. Our attendance has remained constant and we have even found a few new members. Our Christmas party was a lot of fun. I hope everyone that could make it did.

Our meeting for this month will be held Wednesday, February 19th, 1992, at Richard B. Harrison Library from 7 to 9 PM. Club dues are $20 year and provide access to the Club BBS, subscription to AIM, and access to the club Library.

SCAT SUBURBAN CHICAGO ATARIANS

AN INDEPENDENT COMPUTER USERS GROUP

On December 7, 1991 SCAT will hold its members-only Christmas party. The Christmas party is the time of year when we have the club's auction. Robert Schuricht, our first club President, is the auctioneer. Members bring in any old software or hardware they want to sell, and the club takes a 10% selling fee. Brown chicken will be provided, and members are encouraged to bring something to drink and chips or cookies, etc. We will have some Christmas programs running on the ST and 8bit computers.

We also hope our MIDI SIG can set up some Christmas music via MIDI to get our members in the Christmas spirit. There will be a basket for contributions to the Forgotten Children Fund. The meeting will start at 9:30AM until 1:30PM at the College of DuPage, Room IC1000.

The January meeting will start at 10AM on January 4th, College of DuPage, Room K157. John Buell and his brother, Justin, will demo the LYNX game machine. I am told they intent to connect two or more LYNX machines together. Several other member will bring in there game machines. It looks to be a fun demo. No ST demo, but there will be an 8-bit game demo.

If anyone asks, tell 'em you saw their ad in AIM!

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7 PM. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public. Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, SDACE newsletter subscription, and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, CA 92190.

President	Dan Phillips
Vice President	Dean Smith
BBS 3-2400 baud	(619)689-8157

The regular monthly meeting was held on Monday, 18 November with agenda of electing new club officers to guide our course through the coming year. At the end of the not-so-secret ballot, Dan Phillips was chosen to lead our group as the new president, Dean Smith as vice president, Jim Traseger as secretary and Steve Dato returned for another term as treasurer. Congratulations to all of our new and returning officers.

At the same time as we welcome the new folks, we watched the backbone of our group shift positions. Mike Bergman joined the ranks of past presidents, without the pension of the folks in Washington but nonetheless with our gratitude. He will keep his hand in by taking over the newsletter responsibilities.

Former VP Danny Rickey is a full-time student and we'll look for more out of him after the education system gets done with him. Vladimir Vooss, our past newsletter editor and treasurer, is taking a hiatus from the club as he gets ever deeper into work and play in his chosen fields—music and MIDI.

Thanks to our outgoing officers for their enthusiasm and leadership while helping us remain one of the largest Atari user groups in the United States.

Our December meeting will be the annual holiday season party with yet another attempt to break the MIDI Maze record for most active connected STs participating. We plan on getting back on the demonstration track in January, and have another swap meet tentatively planned for February. If you're in the area, please stop by! Everyone is welcome!

STAG Saginaw / Tri-City Atari User Group

"where the deer and Atarians play"

The news this month is pretty much the same as last month. There is interest in the 8-bit area, but the ST members have stopped coming to the meetings. We will continue to make our plans at the last minute and notify everyone by postcard during the week before the meeting. If you have any suggestions please call Bryant LaFreniere at (517) 835-2234 or Marty Schmidt at (517) 792-6029.

Our club will continue to exist, if only on an informal basis, because it's worth it just to get the AIM Magazine. There is $344 in the treasury, and it is possible that those attending the meeting (both of us) will buy some software and have a raffle. I have a hunch the odds would be pretty good.

Steve Volker has made the necessary arrangements to get us a copy of Pagestream to raffle off. We will let you know on the meeting notification postcard when we get it. Just in case these comments create a little interest, remember that the meetings are now on the second Saturday of the month.

C:\FL\Jacksonville\STargroup

Friends, Fun & Atari STs

DTP MIDI GRAPHX GAMES WP +

The STargroup is a computer club specifically for helping members use their Atari STs. Our yearly dues are only $15 and now include a quarterly newsletter along with a year's subscription to AIM. Other benefits include free access to our library of over 50 megabytes of LHARCed public domain and shareware programs for your Atari. The club BBS, the Bandersnatch, has had a fatal hard drive crash and thus no longer exists. We do have a message section on Lief's World (904) 573-0734 thanks to the generous sysop Lief!

There was a distinct lack of Atari news to discuss because of the incredible dissertation last meeting by Pat Augustine on the WAACE show. Pat did have his new 4 meg STe and treated us to some of the STe demos that require a working blitter (something I do not have if you are reading this, Mr. Brodie).

It looks like we will be meeting with the FACE user group either the 3rd or 4th Tuesday and the normal STargroup meeting will be the 1st Monday or Tuesday of each month. When they become firm, I will place the meeting dates here.

The STargroup meets on the first and third Tuesday of each month at La Mirada apts. off of Powers Ave. in Jacksonville, FL. Everybody is welcome.

President	S. Michael Hallack (904) 646-0567
Vice Pres.	Pat Augustine (904) 737-8452
Disk Librarian	Jeff Holland (904) 737-8452
Sec/recruiter	Bob Waddell (904) 737-1905

WAUG!

WAUG General Meeting Minutes 11-12-91

The meeting opened at 7:30 PM with our new Panasonic Panasynch monitor displaying a demo of the new Taito game "Super Space Invaders." President Dave Brzezinski took this time to ask the assembled members for authorization to spend $300.00 at the upcoming Chicago show for door prizes to be used at our monthly meetings. After a report from Treasurer Russ Crum revealed that plenty of funds were available, a motion was made and unanimously carried to spend the money.

Member Bruce Urbanski was then given the floor to run some demo programs to show off some of the sound and color capabilities of the STE. Bruce first showed an ST demo for comparison and then launched into a series of programs like "Boing STE" with stereo sound and 32 simultaneous colors, followed by the Lost Boys "Life's a Bitch" and "Ancool on Atari ST" that showed off the STE's hardware scrolling capabilities. An animation with stereo sound called "The Snowman," and a digitized stereo sound player with full controls were also presented for the audience. For those who know Bruce, you know that no demo would be complete without an interesting game, and he managed to show several that showed off the STE's stuff.

The next topic presented was a solicitation from our President for interest in a group purchase of hardware for 8-bits. We need to purchase a total of 12 items from CSS and we can all then share in discounted pricing. Several members from MACE who were present promised to check at their next meeting to see if there is any interest at that club.

While Dave was talking to the group about the 8-bit hardware, the next demo was set up and ready. The same GIF picture was being shown at the same time on an 8-bit running "APACView," an STE in 16 glorious colors and finally on Pattie Rayl's TT at an astounding 256 colors. The picture looked good on the 8-bit and was very nice on the STE, but realism on the TT was truly amazing. Another GIF picture was shown on all three machines with the same results. The assembled members then began to ask questions about the software used, display colors and resolution of all of the machines used in the demo.

"MultiDesk Deluxe" was the next demo featured at this meeting. While Ken Antkoviak was setting up, Dave snuck in again with some business. Fortunately, it was the monthly door prize drawing which gave the lucky winner an Alpha Data mouse for the ST and the "Bookkeeper" package with a key pad and software for the 8-bit.

After the drawing Ken was ready and began to put "Multi-Desk" through it's paces. He explained that this new version of a classic ST program would now allow you to up to 96 desk accessories for loading (more if one of the available slots were used to load "MultiDesk" into itself -- up to 132 times!) and the ability to hold 32 accessories in memory. The size of the memory buffer is fully reconfigurable from within the program, and you can have different configurations of memory and available accessories for different programs, and even for different screen resolutions if you so desire. Even though he stated that he had only used this program for a month, Ken recommended it very highly. Looks like another fine effort from Codehead Software living up to its promises.

8-bit Librarian Dick Selke was next with the AIM 8-bit Disk-of-the-Month that contained a full featured BBS program for the Atari classic series of machines.

Mike Olin presented his fellow WAUG members with their choice of the WAUG #8 Utilities disk chock full of ST archiving programs, the WAUG #5 Music disc with MCS and Music Studio files, two game disks with a total of 12 games or the AIM Disk-of-the-Month with an "Avant Vector" demo, a "Multidesk Deluxe" demo, a PD program from a local programmer, and loads of other software.

The time for general question and answer brought inquiries from the members about new 8-bit programs as reported in AIM. Were they for real? According to Pattie, that in fact was the case. After very brisk disk sales, the meeting was adjourned at 9:45 PM.

Respectfully submitted,
Dan Cable, Secretary

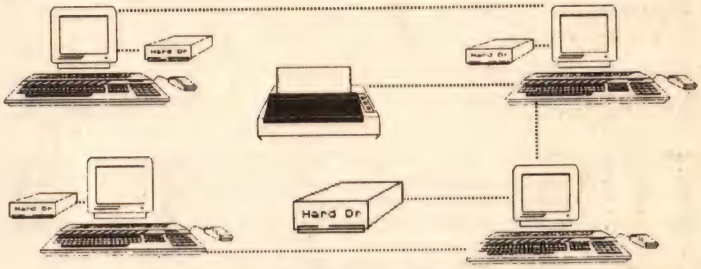
Universal NETwork software is hardware independent. Expand your computer use with networking. Share hard drives, printers, and work easily between computers. Compatible with all TOS versions. Works on all Atari 8, 16 & 32 Mhz computers. The network operates in the background without disrupting foreground tasks. Easy to install and easy to use. Using dual installation, you can even mix hardware devices to connect some machines with MIDI, others in same system with LAN ports. Call us, we'll talk.



Network for less than the cost of a printer!

Universal NETwork software is extremely flexible. Software drivers for different hardware is included. The software supports Lantech, SGSnet, as well as our own MIDInet and LANnet hardware. MegaSTE and TT LAN software drivers for the LAN ports is also supported. Use one or more hard drives or printers in the network. MIDInet and LANnet hardware uses standard 4-wire modular phone technology (not included). Upgrade paths for future E-Mail, security, and network accessories to registered users.

Software Only
2 Nodes.. $219
Extra Nodes $99
Includes 2 nodes software, binder manual, software drivers for MIDI,CART,and LAN ports.

compatible. Pricing for these systems is very competitive.

For long-time Atari enthusiasts like myself, the release of PC compatibles from Atari may be the financially saving move that keeps Atari in the green in the years to come. That possibility makes me excited. On the other hand, the Atari ABC line of computers are just more ho-hum PC compatible computers. I wish Atari success in their PC compatible ventures only to further development and promotion of their real power computers, the ST/Mega/TT line.

Portfolio

Also on display were numerous Portfolio computers and complementing accessories. A table was devoted entirely to the Portfolio, in addition to a display showing its use as a process controller. A light and small train were turned on and off by a controlling Portfolio, displaying the Portfolio as a very neat, compact device controller that is reprogrammable.

CDAR-505

The long, long awaited CD-ROM was on display. The CDAR-505 made for Atari by Chinon was being demonstrated by Carl Bacani from Computer Rock of San Francisco. Atari's suggested list price for the CDAR-505 is $599.00. But what good is a CD-ROM drive without data and program disks? Well, the availability of disks are abundant for IBM and Macintosh computers. I'm told these data disks are accessable to the Atari ST/TT users with a front-end software load module that allows the ST/TT computers to read and utilize them. Atari-specific disks (numbering two now) will total seven by December 1991.

Mega STe/TT 1.44M Upgrade

TT030s were used in most of the software demonstrations, prompting me to ask Bob Brodie about the validity of the rumored 1.44 MByte floppy disk drive upgrade for the Mega STe/TT. Apparently, Atari engineers had to reverse engineer the out-of-production Western Digital high-density floppy disk controller needed for this upgrade.

Socketed WD1772 controller chips were used in Mega STe and TT production to allow easy upgrade replacements. ST and STe owners will not be so lucky, since their drive controller chip is most likely soldered in and the source of the 16 MHz clock to run the new floppy controller is unavailable. Hopefully, some ingenious ST user will develop a method for retrofitting the older model STs for the rest of us.

STBook

The real hardware star of the Atari booth was the STBook. This notebook computer is not just a warmed-over STacy. No, it is a complete, newly-designed ST compatible computer. The STBook is a true, self-contained portable that features an amazing battery life of 10 hours!

TOS 2.xx improvements were made to accommodate the STBook, including a nice feature that will put the STBook to sleep after a user-defined period of inactivity or when the case is closed. The best part of this feature is that the currently active process is stored in memory upon sleeping, to be resumed when reactivated. Nice!

The STBook should come equipped in three different hard disk configurations—40, 80 and 120 Megabytes. Current plans are for all configurations to ship with one megabyte of RAM (non-user upgradeable). A future model will be offered with four megs of RAM.

The "mouse" is an arrangement of three buttons in the upper right side of the keyboard. The largest, middle button is a pressure sensitive mouse positioning

button. Rocking or pressing the button in the desired direction moves the mouse pointer the respective direction on the screen. Firmer pressing actions produce faster pointer movements. The two smaller buttons located closer to the keyboard are the left and right mouse buttons. Nothing different or special about these buttons, except their location.

The feel of this new version of a mouse is really different. I liked the responsiveness and could probably get used to it, maybe even prefer it. With TOS 2.xx in the STBook having keyboard equivalents, use of the mouse is really optional anyway (at least at the desktop), so I don't expect the "real" mouse-only users to complain. *[Ed: an external mouse can be connected to the STBook, also.]*

The connectors and interfaces in the STBook are quite different than other ST computers. In the back, behind a plastic cover, are the new mini-Centronic-style ASCI DMA port, standard ST parallel printer port, 9-pin RS232 IBM-style serial port, and a pair of mini-DIN MIDI I/O connectors.

On the left side of the STBook's chassis is an expansion connector for CPU bus-type peripherals, complete with mounting screws for physical stability. Of course, there is also the power connector for recharging the NiCad batteries and an AC adapter. All this is contained in an 8 x11x1 inch case weighing in at slightly more than four pounds!

Some things are notably missing from the STBook, and for good reasons. The LCD screen is not backlit because of the power requirements. When given the choice between backlighting or long battery life, Atari opted for long battery life.

Also the floppy disk drive and even a floppy drive port are absent. The floppy controller is not included for the same power reasons. Atari will offer an ASCI floppy drive that will connect to the STBook at some future date to add floppy transportability and compatibility. Until then, loading the STBook's hard disk will require an external ASCI DMA transfer using the Atari supplied software and cable.

Other items left off the STBook are the numeric keypad, ST monitor plug, and the cartridge port.

Because the design concept of the STBook is to provide the ST/TT owner with a travelling portable companion computer, the lack of some standard ST peripheral connectors really should not be a concern. The gain for this small sacrifice is an extremely long battery life while maintaining compatibility with the ST computer line in a small, comfortable size.

The STBook on display was not an experimental or prototype model. Rather, it appeared to be in a production, consumer ready form. The displayed STBook was a very nice and refined product that was very impressive. My overall opinion is it will be a hit. Atari's expected availability for the STBook is February 1992.

Matrix Video Card

Another hardware product being used was the Matrix video VME card that fits into the TT030 and Mega STe. This card allows high resolution color displays as good or better than the new XGA IBM standard. Very impressive color pictures were displayed on a 19-inch Mitsubishi multisync monitor. This VME video card is available through a number of sources including Atari.

MIDI

I can profess to *not* being a musician or even understanding music. However, I do know Atari enjoys respect and has a good reputation among musicians. As might be expected, MIDI music hardware and software were displayed in the Atari COMDEX booth. Serious MIDI demos like a direct-to-disk music hardware and software system and sound editing software were just two of the displays. Musically inclined readers should look to other Atari COMDEX reviews for further information.

Bundled Systems

Atari is ready to release bundled ST systems in time for Christmas. There are about three or four different system packages with software subjects like entertainment, grade school education, etc. Included in each kit is an STe and SC1224 monitor. The Discovery Pack includes a 520STe, SC1224 color monitor, four games, a paint program, BASIC and a desktop tutorial program. Another package, the Family Curriculum package, includes 1040STe, SC1224 and a slew of educational programs. Atari's nice software selections and low pricing of these systems are expected to bring in some new first-time ST buyers.

UNIX SYSTEM V

Atari TT030 Unix System V is now available to Unix developers. Atari is rightly very proud of hosting Unix System V on the TT030 computer. It is indeed an accomplishment that could pay big dividends to the bottom line sales figures. Full industry/consumer release is expected in March 1992 when software is expected to be available to bring in immediate TT030 Unix System V sales. TOS will be available in ROM, using a operating system selection desktop routine.

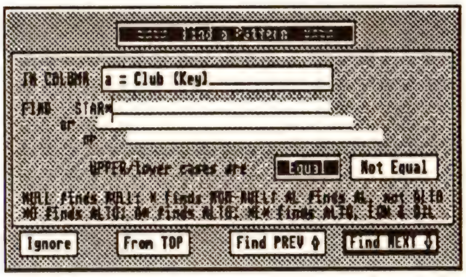
Software

Like any other computer, software is the power behind the hardware. The Atari COMDEX booth had some impressive software applications. The products mentioned below are the only ones I received information on because of their interest to me.

Didot Professional—The guys at Goldleaf Publishing must be scouring the world for the best of the best in ST/TT software, because that is exactly what they have in Didot Professional.

After about an hour-long personal demonstration, I decided Didot Professional has enough capability to satisfy, even overwhelm, print shop personnel. Every question or concern I could think up was successfully answered by Goldleaf's representatives. To me, Didot Professional appears to be one of those rare programs that give you the power today and tomorrow to accomplish any thing you want to do (and more). Didot Professional is serious software with a serious price tag, $995.00.

Informer II—Todd from Soft-Aware, Unlimited was demonstrating the power and flexibility of Informer II. Unlike the typical hard-to-use PC compatible database, Informer II is extremely easy to use while still retaining the high-end database product features the others offer (i.e., graphic import capability, multi-level linked records, lists and sublists, complex and logic sorts, etc).



IN COLUMN a = Club (Key)

FIND STAR*

Informer II has far too many features and capability to list here, but if you are in the market for a better and more powerful database (like me), then Informer II deserves your consideration. *[Ed: See elsewhere in this issue for a complete review.]*

Avant Vector—The most famous programmer duo for the Atari ST/TT computer—Charles Johnson and John Eidsvoog of Codehead Software—also manned an area of the Atari COMDEX booth. On display was Avant Vector, one of their newest professional products. Avant Vector is an excellent graphic conversion utility that converts Atari, Mac, PC or Amiga bit graphic images to vector images automatically for altering, refining, scaling, etc. What was once a laborious and time-consuming "manual" task is now automated. *Nice product.*

Genus—Also on display was Codehead's vector font creator for Calamus called Genus. Genus allows the creation and editing of fonts and other vector objects.

Chronos-3D—Lexicor Software provided demonstrations of Chronos-3D, their keyframe animator. Chronos-3D allows creation of complex animations by linking still frames into an animated "film." Another serious piece of software I'm sure graphics and animation buffs would find difficult to live without.

Attention GFA programmers.

Double Click Software wants to see your **commercial quality** GFA BASIC programs.

We are interested in any application, utility, productivity or entertainment program you have written using GFA BASIC.

If you are a **serious** programmer who wants to make money with your **high quality** GFA BASIC program, then send us a copy of your program, along with your name, address and telephone number. If we like what we see, you will hear from us.

No phone calls please.

Double Click Software

PO BOX 741206
Houston, TX 77274

HyperLink—JMG Software International was displaying HyperLink on an Atari Mega STe. Just like last year, I remain impressed with the versatility and application potential this software has. I don't have to go out on a limb to predict that HyperLink will be a "must have" product for all ST/TT users. Seeing HyperLink in action would be all it would take to persuade you to lay your money down for this one. It's a valuable software asset for a fair price!

Other products on display were Calamus SL from ISD Marketing, Retouche graphics editing software from Goldleaf Publishing and others.

Gadgets by Small was not represented at this year's Atari COMDEX booth even though they were there last year and have been to other important shows this year.

The pen-based Atari computer called the STylus was also unavailable. Mr. Brodie explained the absence of the STylus was due to the great deal of handling it received at the German shows.

Conclusion

In comparing last year's Atari COMDEX presence with this year's, I would have to give the Atari group a much improved score. Product, professionalism, representation, information and image have all increased significantly over last year. The 1991 Atari COMDEX image was strictly professional, nothing but professional. I didn't even hear a squeak about the Lynx

FREE Installation video w purchase of ram board w chips!

Howdy Partner!

ST/IME

Lithium 10 year battery backed-up clock and calendar module that fits in all the ST's. Install it under all the St's. Install it under one TOS ROM chip and all your files will be date and time stamped correctly. Comes with digital corner clock display. Frees up your cartridge port. Stop wasting time setting time! 3yr.warranty **NOW STe COMPATIBLE!**

~~$59.95~~ **$49.95**

Z-SIMMS STe SIMMs

NOW expand your new STe with Z-SIMMS, the STe 1 Megabyte SIMM module that expands an STe to 2 or 4 Megabytes. 1yr. warranty. Highest quality and with STe installation instructions.

~~$79.95~~ **$54.95**

Z-KEYS

- ✓ IBM-PC/XT keyboard interface to the 520STFM/1040ST
- ✓ Solderless internal interface that is easy to intstall.
- ✓ Complete manual and disk included.
- ✓ WORKS WITH PC/XT KEYBOARDS.

$79.95

With Keyboard: $129.90

Z-RAM/2.5 MEG

Ultra low-profile solderless 520ST/520STfm/1040ST 2.5 Meg memory upgrade. Fits under all RF-Shields, including the older 520ST's with external disk-drives. Plug & Play! Comes with 1 yr. warranty, detailed manual, RAMdisk software and diagnostics on disk.

$99.95	~~$129.95~~	w/o RAM
$229.95	~~$279.95~~	with RAM chips

Z RAM/Mega 2-to-4

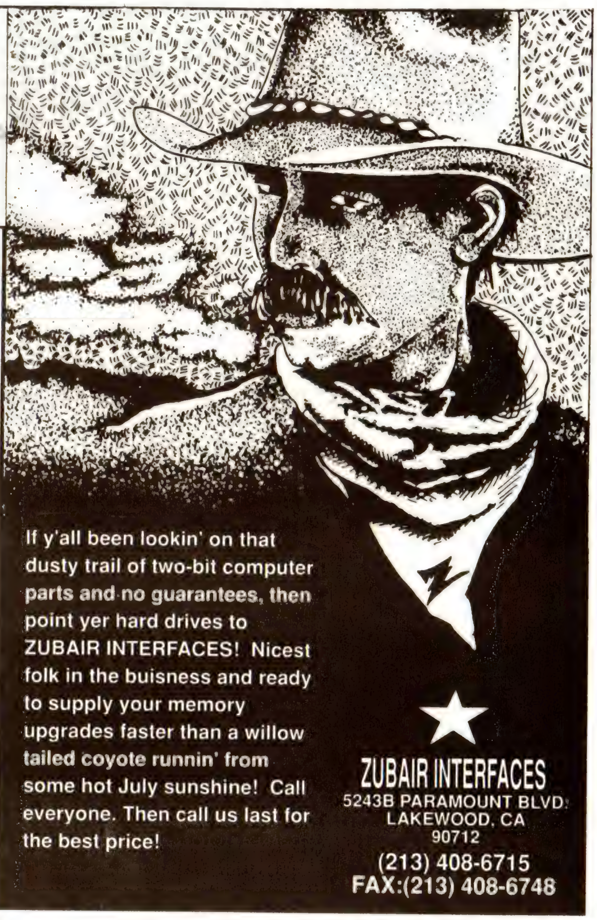
Solderless Mega2 Ram upgrade to 4 Meg. Plugs into the Mega2 and will not interfere with internal hard-drives. The easiest way to upgrade your Mega2 without soldering! Comes with complete instructions and diagnostics disk.

$99.95	~~$129.95~~	w/o RAM
$229.95	~~$279.95~~	with RAM chips

Z-RAM 3-D/4 MEG

Innovative 3-D double decker boards fit into the video-shifter metal box of the ST. Memory diagnostics and RAM disk software included. 1yr. warranty and 30-day money-back guarantee. Super reliable data and ground connections make this *the* upgrade board for your ST.

0K (no chips)	~~$149.00~~	$109.95
2.5 Meg	~~$299.95~~	$249.95
4 MEG	~~$479.95~~	$379.95



If y'all been lookin' on that dusty trail of two-bit computer parts and no guarantees, then point yer hard drives to ZUBAIR INTERFACES! Nicest folk in the buisness and ready to supply your memory upgrades faster than a willow tailed coyote runnin' from some hot July sunshine! Call everyone. Then call us last for the best price!

CompuServe puts the whole world at your fingertips.

When you connect your computer to CompuServe, you join the world's largest international network of people with personal computers. You have access to more than a thousand services that offer a source of support, information, entertainment, communications, and benefits of all kinds.

A world of advantages.

CompuServe lets you take advantage of your personal computer in a thousand different ways.

For instance: communication. You'll get invaluable personal computer software and hardware support from other CompuServe members, as well as product manufacturers, all over the world. Meet in special interest forums to discuss everything from science fiction to sharing software. And keep in touch through electronic mail and faxes, as well as by "talking" over 72 CB Simulator channels.

CompuServe also lets you shop coast-to-coast at hundreds of nationally known stores and take advantage of a world-class reference database. It gives you access to the latest national and international news. And our special financial files offer complete statistics on over 10,000 NYSE, AMEX, and OTC securities. You can even trade online with local discount brokers.

Global travel and world-class fun.

CompuServe also offers airline schedules, so you can check out the bargains and book your own flights on almost any airline worldwide. You can get travel news, frequent flier information, and country and travel facts. As well as listings from over 30,000 hotels.

Plus, there are games. Sports, trivia, educational, space fantasy… you can go it alone or compete against players from all over the world. Only on CompuServe can you test your wits in the only online TV-style game show with real prizes, or leave the earth entirely in one of our interactive space adventures.

Just give us a call.

To become a CompuServe member, you need a computer and a modem. We'll send you everything else, including a $25.00 usage credit with your Membership Kit. In most places, you'll be able to go online with a local phone call.

To buy a CompuServe Membership Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call us today.

And put the whole world at *your* fingertips.

The Church Treasurer

A Complete ST Financial Management Package for Any Church Treasurer

Terry Quinn (P3ACE)

The Church Treasurer is a complete shareware package for use by any church or not-for-profit organization (at least ones that are intentionally setup that way).

Installing the program is fairly simple—all one has to do is make a folder on a hard drive (required), copy the contents of the disk onto it and you are in business. The data disk contains the three main programs, all the required data files and folders, and an extremely detailed set of instructions.

Before any use can be made of the package, it is very important to read the instructions thoroughly. The instructions assume you may not be familiar with either the Atari ST computer or the office of Church Treasurer.

One cardinal rule for automating any management activity is that if you aren't organized before you start, all you accomplish is multiplying chaos.

The creator of this system, William R. Austin, is apparently well aware of this truism, since the documentation deals at great length with the organizational details of how the office of Church Treasurer should be conducted.

In addition to these management recommendations, this package also includes a worksheet template which is extremely useful in ensuring each week's contributions are accurately recorded prior to entering them into the program.

There are four main programs in this package. One, called TREASURE.PRG, forms a common link between the others and provides some security functions like passwords for the sensitive giving information. Two of the other programs, CONTRIB.PRG and INC_CKBK.PRG, do the bulk of the work. A fourth program called NEWYEAR.PRG resets the data files to begin each new year.

All these programs are customizable, even to the extent of being able to modify the fancy graphics title screens. Since these programs were not written to be unique to a particular denomination, the user must set up the various budget categories, gift funds and so on. The programs even include some custom backup options (and, in fact, force you to use them!) to make this often-ignored task easier to do.

The programs all have a common look and feel that, unfortunately, does not include the normal GEM drop down menus and windows. Instead, all menu selections are presented in the middle of the screen and respond to single keystrokes only. Once you get started, the mouse is neither needed or wanted.

Since this system was written in GFA Basic version 3.0, it could probably be implemented in the MS/DOS version of this language with little or no work, since it doesn't appear to take advantage of special Atari features. One other drawback is that the programs work in medium resolution only.

Finally, while it creates a terrific first impression due to the ability to customize the various screens and the foresight that went into the logic, there are some things the Church Treasurer does not do well.

Perhaps the most glaring omission is that none of the primary modules support the accounting convention known as a reversing entry in case of mistake. Although the error checking employed by the program is quite good, it is very inconvenient to correct mistakes once they are found.

Contributions Module

The contributions program is usually the first one encounters in actual use. This program supports 10 "names" files of 100 families each. If a church has more than 100 families, it will be necessary to use more than one file.

While the ability to support multiple files is nice (sometimes churches have multiple suborganizations), the small fixed length of these files is a major inconvenience. A church must have more than 100 members in order to be economically viable in today's economy.

Because many churches support the concept of "pledges" as a planning tool, this program will track and even manage "pledges" for multiple purposes for each family unit. Of course, the program supports a large number of appropriate reports for reporting contributions; both to the Church and to each family (for tax purposes).

One important check for financial accuracy at this level is that total income (offerings) must match contributions. The program gets good marks for forcing this to be so, but exactly what to do about it if things don't match isn't entirely clear.

Of course, if the provided worksheet is followed, the likelihood of this happening is not very great.

Checkbook Module

The checkbook module is just what its name implies—a simple checkbook type of accounting system. One very nice feature is its ability to obtain information from the data files generated by the Contributions module, so reentering the income information is unnecessary.

Of course, the program also supports additional inputs apart from the family contributions program, so it doesn't give up any flexibility either.

Another very important feature that the checkbook supports is a line item budget or "fund" accounting feature. Every income or outgo item must be assigned to a category, and the checkbook keeps track of the status of each budgeting category on a weekly basis. This feature is, in itself, one of the best reasons to recommend this program, since most nonprofit organizations manage their finances in just this way.

In fact, the only financial management problems the program's author has not provided for are human ones which are beyond the purview of this program. The checkbook module also has the usual checkbook reconciliation routines, a generous assortment of hardcopy options and a fair assortment of useful utilities.

Conclusions

Is this package worth the $20 shareware fee the author requests? Well, it depends on your situation. If your organization has an Atari ST setup like the packages requires—hard drive and color monitor— and has a reasonably good paper system for financial management, the potential time savings after this program is first set up can be substantial. Even though it isn't perfect, it is well worth the effort to set it up and use it (a bigger investment than the shareware fee).

Can it be improved? Most certainly! A few minutes work with an accountant to implement "reversing entries" for error correction and the adoption of a resolution-independent, GEM-based display would be a substantial improvement in the versatility of this system.

As it stands right now, this program would be well worth the effort to "port" it to the MS/DOS platform as well, since most Churches contemplating automation will probably begin with a donated PC clone.

In fact, the only Churches that probably won't find this program useful are those who employ "shoebox" accounting or those who are large (and rich) enough to employ a professional financial officer.

44Mb ST Cartridge Drives $599
60Mb High Speed 24Ms ST Hard Drives $399

Hard drive systems come pre assembled, tested, and include 115/230v power supply, cooling fan, Free Public Domain software on request, 2 year warranty on SyQuest, 1 year on fixed drives, boot/partitioning software, cables and instructions for use on your Atari ST/TT computer.

Case Styles

SB-Shoebox 2 drive 7"w x 7"h x 14"d

UM-Under Monitor 2 drive capacity, 15"w x 3"h x 14"d,

UM4 - Under Monitor 4 Slots for 2-5.25" & 2-3.5" drives, (not shown) 16"w x 4"h x 16"d

MIDI Rack Professional 2 Drive shock mounted, 19" Std. Rack, 3 space height x 10.5"d, black, front mounted switches. (not shown)

CS2 - Compact New single drive unit is the smallest SyQuest system available for the Atari ST/TT. Can fit in briefcase. 9.5"w x 10.25"d x 2.5"h. ICD Host SCSI ID switch and SCSI expansion port included.

Host Adapters

Supra with Clock Supra host offers the most options for the money for the Atari ST/TT. Includes the excellent Supra Utilities software.

ICD and ICD+ The standard for Atari host adapters. The ICD host offers very comprehensive software, and comes with free disk caching utilities to speed up performance. ICD+ has real time clock.

BMS Berkley Micro Systems - Fastest data transfer available. Add $10 to ICD+Price.

Dual CPU

This internally mounted switching system enables the user to hook one SyQuest Drive up to two different computers at the same time. By simply turning a switch and changing the cartridge, one can go from running on an Atari ST/TT to a Mac, PC/AT/386/486, MIDI Device, or an Amiga in a matter of seconds. Add $220 for Dual CPU Option. Includes SCSI Port & SCSI ID Selectors and 1 SCSI Cable. Free SyQuest DOS or Mac Drivers on request.

Shaded 80-Column Fonts
An Experiment in 8-Bits

Jerry Bridgman

I am a strictly 8-bit Atarian, but was interested in Jay Craswell's talk about grayscale fonts (Sex, Lies and Graphics/Video, November Atari Interface). A couple months ago, I tried something similar on my 800XL. My goal was to produce 80 columns of readable text on a color TV. Previously I had tried to accomplish this goal in Mode 8, the highest resolution mode available on my machine. I never got very far with this, and put it aside.

Then the idea of using Mode 15 occurred to me. Here you have four "colors" which can be converted to four shades of gray. However, you only get 160 pixels across the screen to work with. This means only two pixels per character for an 80-column text display. The Turbo-BASIC type-in program at the end of this article embodies this idea.

The program works by dividing each character in the standard Atari set into left and right halves. The ROM characters were made on an 8x8 grid, so any row in the grid can have anywhere from zero to eight dots turned on. A half row can have zero to four. This gives five possibilities, but we only have four shades. The program simply assigns the same shade to three and four dots. This is OK, especially since four-dots-on is not common.

The listing is short enough that I expect many people will be willing to type it in and give it a try. If you do so there are two things you need to know. First, the REM statement in Line 91 is supposed to tell you how to type in the string in Line 90 (Control-comma, Control-A...). Second, when you first RUN the program, hold down any of the console keys. This causes the special Mode 15 font to be manufactured from the ROM character set and to be deposited in memory.

From there, all the program does is input a line of text from the user and print it on the screen in 80-column format. As written, the program will do one screen worth of characters. If you want to do more, punch the Break key and rerun it (without pressing a console key).

The Results

So, how does the text look? Well, if you know what it's supposed to say, then you can read it! But, if someone types in something weird or unfamiliar, then you might have problems.

Craswell mentions the alphabet was immediately recognizable in his 2x2, 16-shade font. I can make something like the same claim for my 2x8, 4-shade font. It is still not very practical for a word processing program or any application where you need to read the screen with total reliability.

As an example of the semi-legibility of text you get with this program, I have included a very familiar sentence with a very unfamiliar tag added on at the end. To display this sentence, press RETURN at the INPUT prompt. Owing to a glitch in Turbo-BASIC, you have to press RETURN twice initially.

I find the main sentence is decipherable at least, but the tag is not. Oh, in case you're wondering, I added the tag after watching MTV.

Actually I was a little disappointed it didn't turn out better. I have seen 80-column displays on TVs that were more readable than this one. Notable examples of this are provided by the cable channel Mind Expansion University.

I have seen MS-DOS and Lotus 1-2-3 demonstrated with a full monitor screen appearing at once. (Or almost—I have counted over 70 columns several times.) To be sure, not all the individual letters are legible—lower-case 'u' is an undifferentiated light spot, for example. But ordinary text is generally quite readable.

I suppose the reason for this is that broadcast TV, as opposed to 8-bit computer-driven TV, has twice the resolution because it uses twice as many lines.

Interlacing

Here, there is another tie-in with Craswell's article: Under the heading "VGA Chip Sets" he mentions the inferior (nauseating) display you get with interlacing. This is no doubt true in general, but I sure have seen better screen displays on television than anything I have seen from my computer.

By "better" I mean "more detailed and refined." If you look closely at a weather map, or any of countless other fancy displays on TV, they are often a-buzz with flickering highlights. And yet, these are not usually upsetting to the stomach or even the eye when viewed from a normal distance! My point is that it would be nice to have the power of interlacing even if it took exceptional skill to use it well.

Optimized shaded text might also require exceptional amounts of RAM, at least more than you might think. This is because the correct "shape" for a character could depend on what characters are present on either side of it. Thus, you might well find that a shaded "font" would require several versions of some of the letters.

By the way, how is it possible for the XEP-80 to produce a higher resolution mode through a joystick port?? Could a similar device get us the interlacing I mentioned above? How 'bout it, you techies? I seek enlightenment.

I mentioned that the program is in the public domain. While writing this little program I came across a glitch in Turbo-BASIC (TB) of which I was previously unaware. Look at line 60. This line establishes the initial address for the new Mode 15 font, just below the display list.

This is an unconventional place to put data, because it is unprotected from BASIC. I did it this way because the more usual way doesn't work very well in TB. The "usual way" is to lower the RAMTOP pointer at location 106 and issue a GRAPHICS command. In Atari BASIC, the screen memory is snuggled up under the new RAMTOP leaving an opening in RAM that BASIC won't touch.

TB has apparently eliminated the "snuggling" routine. To make a long story short, you must reserve space at the top of RAM in multiples of 16 pages (four kilobytes). That's quite a chunk on a 64K machine, so I decided to experiment with the method mentioned at the start of this paragraph.

Finally, you might want to experiment with other Atari screen fonts. There are a zillion of these available. After the GRAPHICS statement in Line 20, but before Line 40, load in another font and point location 756 at it. It would be interesting to see how much difference a different starting font would make to the final Mode 15 shaded font.

WOW!

The response to last months ad was impressive! Hundreds of calls were received in the first couple of days concerning our Trade Up! deal. A lot of ST owners are now STE owners! Many people upgraded their system even further with the addition of an ICE 85 MB hard drive. We also sold out in two recent shows, WAACE and Chicago!

Douglas Hodson, Owner

WE CARRY OVER 2000 TITLES, CALL IF YOU DON'T SEE IT!

Trade Up!

If you own a 520 or 1040ST consider trading up to an STE! They're really fast and fun. Call us or better yet call me, Doug, and let me tempt ya!

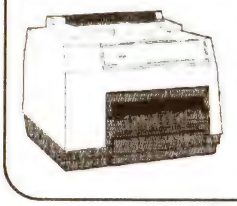
Recycled ST's!

520 ST	$119
1040 ST	$229
SM124	$89
SC1224	$229

Calamus Special!

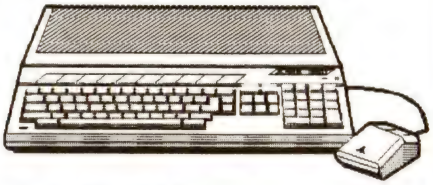
For a limited time you can get Calamus Desktop Publisher for the ST for only $129 with any purchase! To sweeten the deal, if you purchase an STe from us, get Calamus for only $119!

Limited Quantity!



ATARI
SLM804
Laser!
$799

Atari Computers!



Atari STE 512K	$349

DETERM TELECOMMUNICATIONS PROGRAM FOR THE ATARI CLASSIC 8-BIT

Ellen Lentz (ACCT)

DeTerm is a telecommunications program written entirely in assembly language for the Atari Classic computers (XL, XE, 400/800) with 48K and at least one disk drive. It is a Shareware program written and copyrighted by Jim Dillow, and it's available on GEnie, CompuServe, etc.

There are several versions of the program—DeTerm SX212 for the SX212 modem, DeTerm XM301 for the XM301 and 1030 modems, DeTerm 850 for Hayes or compatible modems connected to an 850, P:R or MIO, and DeTerm MPP for the MPP modems plugged into joystick port #2.

Each version has a built-in handler which relocates to LOMEM on boot. There is also a DeTerm for Hayes compatible modems which has no booter or handler—you have to supply your own handler for this version.

To use a modem, there are two requirements. You must load a terminal program into your computer and you must connect to either another computer with a terminal program loaded or to a Bulletin Board System (BBS). A BBS is basically a very enhanced version of a terminal program.

To use DeTerm, you must first configure it, saving the results in a DEFAULT file which will then be loaded at boot-up time. You can prepare a PHONE.LST file containing the phone numbers you wish to dial, which will also be loaded at boot-up time. This file must be named in a file called LIST.BAT.

Print or read the documention file called DETERM.DOC (which comes with the DeTerm package) for instructions to create this file. MODEM.BAT is a "set up" file that allows you to send commands directly to your modem before running DeTerm. (Consult your modem documentation to see what commands you can send.)

To boot DeTerm with DOS 2.0 or 2.5, you should construct a boot file containing DOS files and DeTerm, then rename the DeTerm file to AUTORUN.SYS. (See DETERM.DOC for booting with SpartaDOS.) Boot your computer (modem on) with the disk in Drive 1, with BASIC disabled.

DeTerm includes extensive use of windows and drop-down menus. Most of the documentation is in Help files. It is suggested these files be placed on a separate disk which must be in Drive 1 when accessing them. After booting DeTerm, you can remove the program disk from Drive 1 and put in the Help file disk.

After booting DeTerm, you will notice the menu line at the top of the screen, which contains the following:

```
ONLINE R:DEV MODEM DISK ETC QUIT
```

Whenever the menu line is displayed, you can choose the menu by pressing the OPTION or SELECT keys or using the arrow keys. Display your menu by pressing START or RETURN, or press the first letter of the menu you wish to access.

The menu window under the header will open and you'll see the supported commands. Pressing the Help key ("?") at any menu, gives a brief summary of the commands, if the Help files are in Drive 1. Pressing Escape causes an immediate jump to Terminal mode. Pressing SELECT in Terminal mode returns to the Main Menu.

To become familiar with the program, it's a good idea to boot DeTerm up with your modem turned off. Then, place the Help files in Drive 1. At each command, press "?" for the instructions. To see what information is required, press START or RETURN. Press SELECT to exit without inputting any data. (Be sure to have backup copies of your disks, just in case.)

You may wish to print some of the longer help files for reference while becoming familiar with the program. The Terminal help file is 10A. Go to DOS, choose copy, and type HELP.10A,P: to send this file to your printer.

Return to DeTerm by choosing Binary Load—AUTORUN.SYS. Other help files are Upload, 12A; Download, 13A; and Capture, 14A.

While in the terminal mode the following items appear on the Status line: On or Off (Word Wrap); Full or Half (Duplex); Atari or Ascii (Translation); Current Baud Rate; Number of Bytes in data buffer or the words Full, Upload, Download, or Send (Buffer); and time on-line (Timer).

You can change the settings for the first three Status items by using Control/Shift in combination with another key. For instance, Control/Shift/W toggles Word Wrap, while using the letter 'T' toggles Translation and 'D' toggles Duplex.

Note: Duplex should be FULL if communicating with a BBS and HALF if connecting computer to computer. (If no text appears, or letters are doubled, simply choose the other setting.)

Other Shift/Control key combinations include:

F—Flip game screen.
G—Flip game screen and reset bricks.
R—Reset time to zero.
S—Take snapshot of entire screen and put in buffer.
Clear—Reset buffer count to zero. Data in buffer will be lost.
Escape—If capturing to disk, then the data buffer will be saved and the file closed.
1-5—Send macros 1-5 to modem.

Current settings for the following are saved in the default file when you use the *write* option in the ETC menu:

Download Batch Drive—Online Menu, Down option.
Upload Protocol—X-Type menu.
Download Protocol—X-Type menu.
Baud Rate—R:Dev menu.
Translation—R:Dev menu.
Edit Window—Term menu.
Dial Mode—Modem menu, Mode option.
Connect Wait—Modem menu, Wait option.
Drive Numbers—Disk menu, Drive option.
Margin—Etc menu.
Color—Etc menu.

The ONLINE Menu includes commands to upload or download a file, capture text to disk or send text directly from disk to the host computer (BBS), save data in buffer to disk, view or print data in the buffer or a file, and zero out data in the buffer.

The MODEM menu contains options for dialing a phone number from the keyboard, accessing or creating a list of phone numbers, maintaining a list of PC Pursuit City nodes and functions for various modem settings.

The DISK menu allows you to select default source and destination drives; get a directory of the source drive (you can also press 1-9 from any menu selection); copy, move, rename, lock, unlock, erase, view or print a file without going to DOS; and format a disk.

The ETC menu allows you to set left-hand margin, change screen and text colors, and read or write the Defaults file. This menu also contains information (Option N/A) about the Command Line Interface between SpartaDos and XL/XE computers, as well as a binary file loader (HELP.54A).

Don't be afraid to experiment. It takes time to learn a new program. The HELP files can all be viewed, and the configuration files created, without turning on the modem. Even if you don't have a modem, viewing this program might help you decide to get one. Once you have configured your files, the program is very simple to use. There is even a game you can play during long uploads and downloads.

If you enjoy this program send a contribution to:

Jim Dillow
P.O. Box 2552
Sarasota, FL 33578.

For further information you can contact him on CompuServe or GEnie. Remember, it's contributions from Shareware authors like Jim that keep the Atari Classic alive. DeTerm can be freely distributed if you include all Help files and modules.

If you have a program you would like to learn how to use, or one that you would like to have reviewed in AIM, send a copy of the program and all documentation to the address at the end of this paragraph and I'll see what I can do with it. I've been having quite a good response to these articles, but am always looking for something to write about.

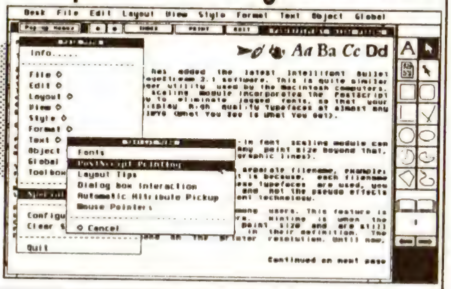
ST/STE/TT Compatible



- Includes an online index.
- Applying before and after paragraph line spacing.
- Anchoring text around irregular graphics.
- Adding color to black laser type.
- Creating initial caps.
- Creating pullout text block.
- Resizing object proportionally.
- Using master pages.
- Manipulating graphics.
- Digital halftoning.
- Online help for all commands!
- Defining object center.
- Using vector and bitmap graphics.
- When to use .PS and .PSF files.
- Printing with UltraScript.
- Layout tips.
- Picking up text attributes.
- Send summary to printer for hardcopy reference.
- Tutorial on color separation.
- Includes a 52 page manual (8.5" x 7") packed with tutorials on how to master the macro command, design textual and graphic effects (such as rotating objects in a circle, place text on a path, etc), layout tutorials and much more.
- Resolution independent!
- Easy installation.
- Runs as an accessory.

Programming in Michtron Command Language
A Tutorial for Michtron BBS 3.0 Sysops

Jeff Wells

Have you ever called a new Bulletin Board System and found it to be the same as all the other Bulletin Board Systems using that software that you have called before? The only difference is in the Message Base topics and what type of systems the BBS supports.

Tim Purves, author of Michtron's BBS, has created a Bulletin Board System that is as flexible as the System Operator's imagination. Michtron's Bulletin Board System (MBBS) is written entirely in a language called Michtron Command Language, or MCL for short.

This allows you to make changes to the BBS as you desire, or as your knowledge of programming in MCL will allow. What I hope to accomplish in these articles is to familiarize you with programming in MCL.

Getting Started

Before we get started, I would like to tell you about MBBS if you are not familiar with it. MBBS v3.0 is a multi-line, multi-tasking BBS. What does this means to you?

It means that, while one or more callers are logged on, you can be logged on doing whatever you like at the same time. The caller may be downloading a file while you are reading your mail or even doing system maintenance. This makes your BBS a true 24-hour BBS.

I have been programming in MCL for about 18 months now. After having a degree in Computer Science, I thought MCL would be easy to learn and code. Some of the obstacles I encountered quickly changed the way I programmed.

For example, MCL only deals in Integer numbers. This means you cannot use a number greater than 32,767 or less than 0, and the result of all arithmetic functions will always be in integer form, no decimals.

One other major tool missing from MCL is the ability to use arrays, something most programmers take for granted. Aside from those differences, MCL was modeled after C and has most of its features. MCL does not use line numbers.

Learning MCL will also aid you in Structured Programming, which may be defined as the constuction of programs from smaller programs that are either structured programs themselves or made up of a number of particularly well understood control structures.

Learning MichTron's Contol Language will also aid you in structured programming.

A Global Approach

All variables in MCL have a "Global" scope—once you set a variable to a specific value, that value will be the same until you change it. If you write a program that calls another program, then the variables you set in the calling program will be the same in the called program. This is very helpful when you start writing programs that call upon other programs to get the result you want.

When coding MCL, you will be able to use 28 *numeric variables* and 28 *string variables.* These variables consist of a one letter indentifier, with a string variable having a trailing dollar sign($). For example, *a* is a numeric variable which may be set from 0-32767, while *a$* is a string variable which may equal up to 79 characters in length. When defining a string variable, you must put quotes around the string.

```
Numeric Example: a = 374
 String Example: a$ = "Your Name"
```

If you accidently assign a string to a numeric variable, or vice versa, you will be reminded during the compiling of your program with a compiling error.

Abbreviations

The following abbreviations will be used throughout this and following articles:

```
expr  =  Numeric Expression
var   =  Numeric Variable
sexpr =  String Expression
svar  =  String Variable
```

Assigning values or strings to either var(s) or svar(s) is very simple and yet complex. For example:

```
 var  =  expr  Assigns expr to var (a = 3 + 4)
 var +=  expr  Adds expr to var (a = a + 5)
 var -=  expr  Subtracts expr from var (a = a - 5)
 var *=  expr  Multiplys var by expr (a = a * 5)
 var /=  expr  Divides var by expr (a = a / 5)
svar  =  sexpr Assigns sexpr to svar (a$ = "Joe")
```

These six examples are going to be the most commonly used ways to assign values. There are others that we will talk about in future articles.

Labels and Subroutines

Let's talk about *labels* and *subroutines*, or procedures. A label is like a book marker, or a reference point, and is usually used for error trapping or to identify a point within a program. A sub-routine or procedure is a section of code within a program you might use more than once.

When calling a subroutine, the flow control of the program passes to the identified routine, the subroutine code is processed, and then control is returned back to the source that called it.

An example of labels and subroutines might look like this (the lines of text between /* and */ are comments):

```
Start_here:; /* This is a label and subroutine. */
  ...        /* notice the colon followed by a */
  ...        /* semi-colon. This identifies */
  ...        /* either a label or subroutine. */
  if(a > 7)
    print("Your number");
   a += 1;
  ...
return; /* The "return" tells the computer to
return to the calling program at the line directly
below the 'GOSUB" command. Notice the trailing
semi-colon. */
```

In this example, the label "Start_here" is also a subroutine due to the following "return." This routine checks to see if the variable *a* is greater than 7 and then diplays the message. Regardless of the outcome, it adds 1 to the variable *a* and returns to the calling program. This is not a common use for a subroutine, but a good example of one.

Maintaining flow control of your program impacts the outcome desired. Flow control statements are commonly known as 'Loops'. MCL supports four different types of these loops. In the following examples, we will attempt to obtain the same results using the different types of loops.

IF/ELSE—This loop will check a condition. If the condition is met, it will execute the following code. If the condition is not met, it will execute the code under the ELSE, if there is one.

```
a = 1;          /* Set starting value of a to 1 */
start_loop:;    /* Label */
  if(a == 7)    /* Condition */
     /* IF Condition is TRUE */
     print("\n",a,", Your lucky number");
  else          /* IF Condition is FALSE */
  {
     print("\n",a); /* print value of 'a' */
     a += 1;        /* Add 1 to variable 'a' */
     goto start_loop;  /* Goto our label above */
  }
```

If you are going to execute more than one process after checking a condition, you must enclose the processes with { and }, like in the ELSE example above. When we checked for a TRUE condition, we did not have to enclose the print statement with { and }. When the condition was FALSE, we did have to enclose because there were multiple processes to execute.

WHILE—This loop checks the condition in the beginning of the loop and executes all processes within the enclosing brackets.

```
a = 1;
while(a < 7)           /* Condition */
{
   print("\n",a);      /* Condition was TRUE */
   a += 1;
}
print("\n",a,", Your lucky number.");
/* Condition was FALSE */
```

In this example, we are checking the condition *a* < 7 in the WHILE command. If the variable *a* is less than 7, we print a carriage return (\n), and then we increment our variable *a* by 1. When this statement becomes FALSE—when our variable *a* is equal to 7—we print a carriage return, the value of our variable and then the message.

The main point to remember with a WHILE loop is that it checks the condition first. The condition must be met before any of the code within the WHILE loop is executed. This does not mean that you cannot have another loop within the WHILE.

REPEAT/UNTIL—The difference between a REPEAT/UNTIL loop and a WHILE loop is that a REPEAT/UNTIL loop checks the condition at the end of the loop, forcing the loop to execute at least once, while the WHILE loop checks condition first and may exit before it executes at all.

```
a = 1;
repeat
{               /* Loop executes at least once */
     print("\n",a);
     a += 1;
}
until(a > 7)    /* Condition */
print("\n",a,", Your lucky number.");
```

This gives you the required results, but forces the program to loop through the code at least once. Even if *a* was greater than 7 to begin with, this code would add 1 to it.

FOR—The FOR loop assigns the variable, sets the condition and sets the incrementing value all in one step.

```
for(a = 1; a < 7; ++a)
{
   print("\n",a);
}
print("\n",a,", Your lucky number.");
```

In this example, we set variable *a* to 1, gave the condition of 'if *a* < 7 execute the following', and told the loop to increment *a* by 1.

Loops are very powerful when coding your program, especially if you are doing repetitive coding. Deciding which loop to use depends on when you want to check the condition of the loop.

Exiting Gracefully

If you are in a FOR, REPEAT or WHILE loop, you cannot exit by using a GOTO statement. You may, however, use GOTO statements within the loop, as long as you have the LABEL within the loop.

Exiting a FOR/REPEAT/WHILE loop can only be done in two ways—either the condition is met or you use a BREAK command. The BREAK command stops the loop in all cases.

A CONTINUE command in a FOR loop will jump to the incremental expression statement of the loop (in our example, that was the *++a* statement). In a REPEAT or WHILE loop, the CONTINUE command jumps to the top of the loop. There may be up to 16 unsatisfied BREAK/CONTINUE commands in your code during compilation.

System Stuff

There are 32 unique System Variables pertaining to each user on your BBS. These range from the user's address, phone, number of uploads and downloads and so on. These system variables are categorized as *string read only, integer read only, integer* or *STRING.* If a system variable is *read only,* that's exactly what it means—you can only read these variables and not assign them values. The *integer* and *string* variables can be assigned new values by you during your program.

There are also 78 System Procedures/Functions you can use during your coding. The difference between a System Procedure and a System Function is that you cannot assign a System Procedure to a variable. System Functions may be assigned. In other words, System Functions return a value while System Procedures do not.

For example, *display_user()* is a System Procedure. You would not want to assign *a = display_user().* On the other hand, you might want to assign a variable to the *disk_free(sexp)* function before receiving an upload, as in *a = disk_free("c:\\upl\\");*.

About the Author—Jeff Wells is sysop of the Lone STar BBS in Killeen, Texas, (817) 690-1993, 12/2400 baud. Jeff has authored a number of games and utilities for Michtron's BBS, including NFL Yesterday, ProduceM (Movie Madness), an online dating service and an MCL version of Space Empire Elite, a popular FoReM BBS game.

MegaType is probably best know for their font conversion (FontVerter) and font creation (Font Designer) software.

The company is also an excellent source for superb quality fonts. Each MegaType Faces Font Pak will be a welcome addition to any DTPer's font collection.

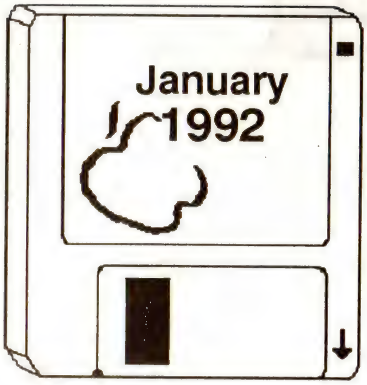
MegaType's Font Paks each contain Calamus, PageStream and Type 1 font formats on the same disk.

Fonts for Calamus are compatible with all versions up to and including 1.09N.

PageStream font versions include all files for compatibility with PageStream versions 1.8x or 2.1.

Adobe Type 1 format files come complete with font outlines, Adobe font metrics and metric files for Windows 3.0 with Type Manager (for use on an IBM with Windows or Corel Draw).

For more information or to order Faces Font Paks, contact MegaType, PO Box 645, South Bend, IN 46624, (219) 288–7468.



AIM Mac/Spectre Disk Of the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting archives. Just double click to extract!

Here is a short description of the files contained on the January '92 Mac/Spectre Disk of the Month:

DeskZap—DeskZap allows you to set Finder info for a file; remove LFs and other formatting codes from text files; delete, copy, rename or move HFS folders; move files to different folders, and much more, all in DA form.

FlashWrite—FlashWrite][1.03 is a word processor in a DA. Supports a Find feature, word/paragraph count, multiple fonts and text styles and much more.

GIFwatcher—This desk accessory lets you view GIF images while you are dowloading them. Save time by cancelling images you don't want. Also has a dithered black-and-white mode for viewing GIFs on a monochrome system. Version 2.0 adds features for fast viewing of existing GIF files, conversion to PICT format, color dithering (great for desktop images) and more. Version 2.0.1 adds automatic opening of new GIFs.

Household Shopper—Household Shopper 2.2 can save you money by helping you become a better shopper. Lots of built-in text teaches you better shopping habits. Use the program to create shopping lists from over 2,000 items, track coupon usage, etc. Item information can be fully customized. Excellent interface and very easy to use.

PicaCalc 2.0—DA with special features for DTP. A programmable scientific calculator with a twist, PicaCalc uses algebraic entry with any combination of U.S. or metric measurement and/or typesetting units. Sports 16 digits, transcendental functions, Polar/Rectangular conversions, clipboard, 10 non-volatile memories, conditional branching, user defined functions, user defined prompts and more. Save pica programs for later use!

System Picker—System Picker lets you switch between different System Folders easily. It can help ease the transition to a new System setup by letting you keep multiple Systems in the same volume.

To Do!—The To Do! DA is an attractive, well-done program for keeping track of your daily activities. Easy-to-use and very handy. Save individual To Do lists for multiple topics and even print the lists for hardcopy reference.

UPS Shipper—A complete UPS shipping program. Eliminate the need for UPS books! Prints labels and COD tags. All Zones are incorporated, including International. Great for small businesses.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the January '92 Mac/Spectre Disk and which format when ordering.

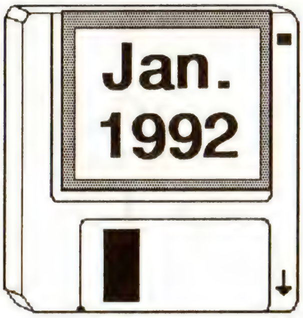
Also, we have another special Games disk for January. The January '92 Mac/Spectre Games Disk contains a single game, but it's a great one. The game takes up a whole disk!

Drakmyth Castle—Designed exclusively for the Mac 512K, Plus, 512Ke, SE, and Classic, this very excellent game is also great for Atari/Spectre owners. Assume the identity of the bold peasant as he dares to venture from his village in an attempt to defeat the ominous castle's sorcerer who cursed the village with a deadly plague. Lots of good graphics, nasty monsters and creepy sounds in this graphic adventure.

This file is ready-to-run; no need to extract this game. (It was so large even when compressed that we couldn't find another game to fit on the disk!) Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the January '92 Mac/Spectre *games* Disk and which format when ordering.

NOTE: This Games disk is not part of a standard subscription to our Mac/Spectre Disks of the Month. If you are a disk subscriber and want this disk, you must purchase it separately.

AIM ST/Mega Disk of the Month



All files on this disk are self-extracting LZH archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the January '92 disk. For more complete docs, see the text files contained in most of these archives.

BOB.APP—A program for your AUTO folder that displays Bob (from the Church of the Sub-Genius) when you boot up. Silly? Yeah. Pointless? Maybe. But hey, it's FreeWare from @ircular Logic! (c)1991. "@ircular Logic, cut us some slack."

CAL602.APP—Version 6.0.2 of Bill Aycock's popular Calendar desk accessory. Lets you look at any month/year and schedule events by date, position, or every so many days. All new screens, more room to describe each event, cyclic events, save/load/merge events, keyboard shortcuts, auto conversion from previous versions, and much more!

CALPRINT.APP—CalPrint is a program that generates a one-month-per page calendar. Version 1.5 adds the ability to output to a text file for editing and extensive notes capability, including multiple note files for any month. Handles any year from 1900 through 3000. ShareWare from Chris Sorensen. Free future updates for registered users of 1.5.

DOORS.APP—Michtron BBS 3.0 MCL file from Jeff Wells. DOORS.M automates generation of a Games menu for your Michtron BBS. By using this module, you only have to update a text file whenever you add a new game to your system!

EDWIN APP—Incredibly small text editor ACC/PRG from Clear Thinking's Craig Harvey. Edwin essentially allows you to create/edit one window worth of text (2K), but the program is just 6K (takes a whopping 10K of RAM). For writing short notes, addressing envelopes, etc. Edwin can be useful for anyone tight on RAM. If you're not tight on RAM, buy EdHak from Clear Thinking and get a full-blown editor that can edit ANYTHING.

EPD10.APP—The Extended Palette Driver 1.0 is a complete replacement for the driver that JRI shipped with their 4096 color card. The EPD was written at the request of Prism Paint owners so they could access the larger palette. Since the program patches all necessary XBIOS and VDI calls to work with 4096 colors, other well-written GEM applications should also benefit. This program is freeware from Robert Birmingham, the author of Prism Paint.

GAZETEER.APP—Gazetteer is a US Atlas that contains a volume of info on the US, including ZIP Codes, Area Codes, Timezones, Maps and much more! Program written by Dave Stuart.

JETON.APP—This tiny ACC "kick-starts" your DeskJet if you forget to turn it on before you boot your ST. Great for when you've designed the perfect page, but realize your DeskJet isn't on! Uses only 350 bytes of RAM, runs in any resolution on any ST/STe/TT. Another great program from Bill Aycock.

MARROW.APP—Marrow is a unique program that enables you to use your mouse from within non-GEM programs. Marrow allows you to switch your mouse into 'keyboard mode' to emulate the cursor keys, and then back again at the touch of button. A very small program that is a must for every ST owner that uses any TOS programs.

METCON APP—A US <-> METRIC converter. Very extensive. Includes temperature, distance, area, mass and volume conversions. Bidirectional. Another great program from Dave Stuart.

MOUSEBT2.APP—A very nice system bootup/configuration program that works on all systems and all resolutions, from the TT on down. Selected your auto programs, desk accessories, assign.sys files, desktop.inf/newdesk.inf files and more.

NFL_YEST.APP—Michtron BBS 3.0 online game. NFL Yesterday allows your callers to coach their favorite NFL team, playing against the computer head-to-head or against other callers. With 28 teams, complete stats and lots more, this is a game your callers will really like! Written by Jeff Wells.

RACKEM.APP—Three games in one: pool, billiards and snooker. Runs in ST low resolution on ST/STE/TT. GFA basic source code and instructions included.

RAPSHEET.APP—The Rapsheet time logging program allows you to keep track of time spent on various tasks (on your computer or elsewhere). Breaks tasks down by type (work, play, etc.). Great for keeping records of how much of your computer is used for work and how much for play (for tax reasons). Also great for recording time spent on various tasks at work for billing purposes. Version 1.3 adds complete logging of when each task was started.

REALRAY APP—A ray tracing program written and compiled in GFA BASIC. Runs in ST low resolution ST/STE/TT. You set up a scene with spheres, walls, floor, ceiling and light sources as required. Objects can have degrees of reflectivity and refraction and can be colored. Creates very realistic pictures.

REVERSI.APP—Demo of CPX Reversi, a control panel extension from @ircular Logic. It is a demo only in the sense that it allows four uninterrupted games before it starts reminding you it is a demo. Otherwise, it's fully functional. Register your copy to get rid of those annoying reminders! Must have XCONTROL.ACC to use this CPX.

SEE_V20.APP—Another great Michtron BBS 3.0 online game from Jeff Wells! Space Empire Elite MCL brings the popular FoReM game of galactic conquest to MBBS. Players build their empires, spy on their neighbors, support covert strikes against their enemies and lots more. If you run Michtron's BBS and support online games, this is a MUST HAVE!

SHREDR2.APP—A major update to Shredr+, the file deletion utility from DO NOT STAMP Software. Shredr+ ensures your privacy by permanently deleting files from your disks. Too many features to list here, but this version adds an all-new GEM interface, supports MaxiFile III's "backdoor", and is over three times faster than the previous version. Color/Mono supported. Fully functional Shareware.

SONGFILE.APP—Catalogue your music/video collection with the Songfile database from Andy Osborne. This UK import gives you the ability to build a list of all your records (albums, EPs and singles), tapes, CDs, DATs and videos. Search by song, artist, album title, and more. Print a complete index of your collection, for individual albums, etc. Runs in ST medium or high resolution on all machines from ST to TT.

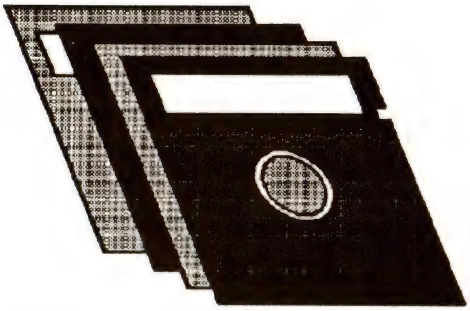
SWITCH APP—Switch is a neat little ACC from Russia that changes the system font to give your ST a more Mac-like appearance. Also, pressing LSHIF+RSIFT gives you access to the second half of the character set. The Russian Cyrillic characters are stored in ASCII locations 128-255 Works on ST/STEs in all resolutions, including Mega/STE. Does not work on the TT.

VANITY.APP—A Vanity Plate CPX. Great for the next time you need to use the computer and your spouse/roommate says "I don't see your name on it." Pop open the Vanity Plate control panel extension and show 'em! Freeware (c) 1991 from @ircular Logic. You must have XCONTROL.ACC to use this CPX.

WHATIS52.APP—Whatis version 5.2 identifies over 100 file types—ARCs, LHarcs, PRGs, pics, ACCs, animations, etc...no more "what kind of file is this?" problems! Runs as a PRG or ACC (just rename the file) on any ST/TT in any resolution. Short docs included. This version adds PFX and AFX files, Newdesk XIC icons, SDS DJ and Printer Utils setup files, and MSDOS EXE and COM files. PLUS, Whatis can now act as a 'file type server' for other applications!

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the January '92 ST disk when ordering.

AIM
Atari Classic (8-bit) Disk
January, 1992



Each AIM 8-bit Disk of the Month is a single-sided, single-density "flippy" packed with software. To extract files in the ARC format, you need the UNARC.COM utility and to decompress files with a DCM extension, you need DISKCOM3.UTL (available from most BBSes, user groups or on the April/May '91 AIM 8-bit Disk).

ATARIMNU.ARC—An excellent disk menu program that allows you to load/run program files or BASIC files. Lots of options. Complete docs included. NOTE: Tested with Atari DOS 2.5 only...DOS 2.5 included on this disk for your convenience.

BUNNY.DCM—Bunny Busters is an arcade shoot-em-up from the military personnel at Fort Huachuca, Arizona. Shoot the jackrabbits and other critters as they scurry across the screen. But, watch out...some of those critters can shoot back!

HURPLOT.DCM—Gulf Hurricane Plotter comes from the New Orleans Atari User Group. Plot the path of your favorite hurricane(s). A nice educational tool with excellent graphics.

MEISTER.ARC—A Simon-like game. Try to match the sound and color pattern, using the joystick. Can get pretty hard in just a few rounds. Three different play modes available.

SHADEDFT.ARC—Turbo BASIC program accompanying J. Bridgman's "Shaded Font" article in the Jan. '92 issue of Atari Interface.

Side 2

DRAW7XEA.ARC—A very nice graphics drawing program designed for the Atari xE (or other Atari Classic computer with at least 128K of memory and BASIC XE). This arc contains Side 1 of a disk, minus DOS. UnARC this file to a newly formatted disk with DOS 2.5 written to it. Then, reboot to use the program.

DRAW7XEB.ARC—Docs and demos to go along with DRAW7XEB.ARC. UnARC this file to side two of your Draw XE disk.

TPJOY.ARC—A very handly little program from John McGowan. This VBI-driven routine adds joystick scrolling capability to TextPro. Now, you can use the joystick to scroll quickly around your text! Includes docs and source code.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the January '92 8-bit disk when ordering.

AIM Subscription Form

Name: ______________________________

Address: ______________________________

City: ______________ State/Country: ______________

ZIP/Postal Code: ______________ Phone: ______________

Please enter my subscription for

☐ One Year (12 issues) ☐ Two Years (24 issues)

Subscription Rates: US 3rd Class — $18 for 1 year, $32 for 2 years
US 1st Class — $36 for 1year, $50 for 2 years
Canadian — $42 for 1 year, $70 for 2 years
Foreign — $48 for 1 year, $80 for 2 years

Please make check or money order payable in US funds to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

I wish to receive your Disk of the Month. I am an AIM subscriber.

☐ ST/Mega (12 double-sided disks) — $50
☐ Mac/Spectre (12 DS disks) — $50
☐ Atari 8-bit (12 SS/SD "flippies") — $50

Sign me up for your Disk of the Month only. I am not an AIM subscriber.

☐ ST/Mega (12 double-sided disks) — $60
☐ Mac/Spectre (12 DS disks) — $60
☐ Atari 8-bit (12 SS/SD "flippies") — $60

AAAUA ATARI 8-BIT USER GROUP

Club Name: Alamo Area Atari User Association
Acronym: AAAUA
Address: PO Box 79-1426, San Antonio, TX 78279
Meetings: Balcones Heights Community Center, 107 Glenarm, San Antonio, TX. 107 Glenarm, San Antonio
Day: 1st Tuesday of each month
Time: 6:30-9:30 PM
Founded: 1979
Dues: $24; Subscribing: US-$16, CAN/MEX-$36 ($14 no AIM), Other-$54 ($18 no AIM)
System(s): Atari 8-bit
Contact: Al Sherrill (512) 492-6633
Benefits: Library of around 700 disks. (FR)ANTIC monthly newsletter. Swap meet and computer workshop each 3rd meeting.

AACE
ALBUQUERQUE ATARI COMPUTER ENTHUSIASTS

Club Name: Albuquerque ACE
Acronym: AACE
Address: 1021 Sagebrush Trail SE, Albuquerque, NM 87123
Day: General: 1st Sat and 3rd Tues, 8bit: 2nd Tues
Dues: $20/yr payable in January
System(s): Atari 8-bit and ST/Mega/TT
Contact: Richard Houser (505) 299-3977
BBS #s: Astro BBS: (505) 260-0448
Benefits: PD library access, BBS membership. Swap meet on 1st Sat. of June and December.

AUSTIN ATARI COMPUTER ENTHUSIASTS
AACE

Club Name: Austin ACE
Acronym: AACE
Address: 305 Meadow Creek Dr., Round Rock, TX 78664
Day: 1st Wednesday of each month
Founded: August 1981
System(s): Atari 8-bit and ST/Mega/TT
Contact: Chris Davis (512) 388-1974
Benefits: C classes for ST and 8-bit.

ABLE

Club Name: Atari Boosters League East
Acronym: ABLE
Address: PO Box 1172, Winter Park, FL 32790
Meetings: Orlando Public Library, Palm Magnolio Room 101 E. Central Blvd., Orlando FL
Day: Last Sunday of each month
Time: 1:30-4:30 PM
Dues: $12/yr
System(s): Atari 8-bit and ST/Mega/TT
Contact: Hadley Nelson (407) 671-0317
Benefits: Access to the ABLE Program Library of User Software (ABLE PLUS) and ABLE AID newsletter.

TEAC
The Educator's Atari Club

Educators' Atari Club
Acronym: TEAC
Address: PO Box 1024, Laytonville, CA 95454
Meetings: Operates by mail, members are spread all over the world.
Founded: 1986
Dues: $25/yr
System(s): Atari 8-bit and ST/Mega/TT
Contact: Pete Loeser (707) 984-8048

WACO

Club Name: Westmoreland Atari Computer Organization
Acronym: WACO
Address: 230 Clairmont St., North Huntingdon, PA 15642
Meetings: North Huntingdown Town House, near Irwin, PA.
Day: 2nd Tuesday
Founded: December 1983
Dues: $20 individual, $24 family
System(s): Atari 8-bit and ST/Mega/TT
Contact: Patty Marshall (412) 225-8637
Benefits: Participates in many Atarifests in the northeast.

WAUG!

Club Name: Washtenaw AUG
Acronym: WAUG
Address: 42047 Hanford, Canton, MI 48187
Meetings: Michigan Student Union on State St. at the corner of S. University in Ann Arbor.
Day: 2nd Tuesday
Time: 7:30PM
Dues: $15/yr
System(s): Atari 8-bit and ST/Mega/TT
Contact: Craig Harvey (313) 971-8576
BBS #s: MOlin's Den - (313) 451-0524
Benefits: Monthly 8-bit and ST raffle, free ticket for members.

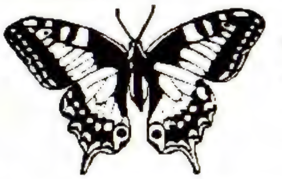
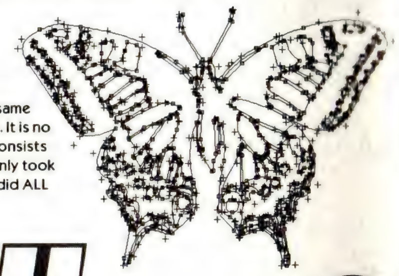
This small butterfly is unremarkable. The others are a new species you can breed on your Atari computer.

Automatic vectoring has arrived.

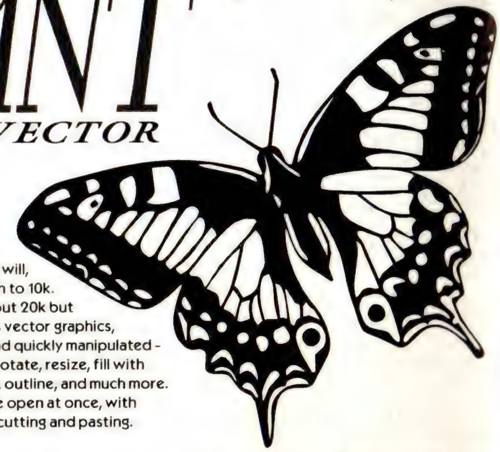


To the left is a pixel-based .IMG picture. In other words, the picture is made up of dots. It's a 58k file. The image can't be enlarged much more than this without the ragged edges showing. (In fact, they're showing already.)



To the right is a snapshot of the same image after it has been vectored. It is no longer made up of dots. It now consists of lines and bézier curves. This only took a few minutes and Avant Vector did ALL the work for you.

AVANT VECTOR



This is the .CVG vector version: it can now be enlarged or reduced at will, and the file size is down to 10k. The .GEM version is about 20k but otherwise identical. As vector graphics, the images are easily and quickly manipulated - you can stretch, skew, rotate, resize, fill with gray scale percentages, outline, and much more. Up to 7 windows can be open at once, with clipboard features for cutting and pasting.

Avant Vector is a cutting-edge graphics tool that's fast, easy to use and surprisingly versatile.

The large butterfly wing on the right is a vector image created by Avant Vector. Using "automatic tracing," a bit image graphic (the smaller butterfly) was converted to a vector graphic, resulting in the smooth output you see here.

Vector graphics have big advantages over bit image graphics - they make much smaller files, and they can be scaled to any size without losing resolution or looking blocky. And Avant Vector's tracing routines are highly sophisticated; in a recent review of 7 Mac, PC, and ST auto-tracing programs, Avant Vector was rated best of the bunch! This means there's less editing after tracing an image, and you get more work done in a shorter time.

Avant Vector supports .PI3, .PC3, .IMG, .BLD, .PIC or .PAC formats. You can trace Mac, PC or Amiga graphics, in .TIF, .IMG or .IFF formats. The plotter version (Avant Plot) can also load and save HP plotter files, and sports a full range of plotting, drawing and cutting options.

Avant Vector can create .CVG files for Outline or Calamus, and .GEM files for use in programs that support the GEM3 format. And Avant Vector's ability to load and save Encapsulated PostScript brings the entire world of EPS graphics to the Atari ST and TT at last!

Since Avant Vector is a full featured vector graphics package, you can touch up a picture you've traced, or draw pictures from scratch - with an intuitive, speedy interface you'll learn in a matter of minutes!

Call or write CodeHead Software for more information about Avant Vector (and its amazing cousin, Repro Studio). Special introductory pricing is available until December 31, 1991. Act now and save!

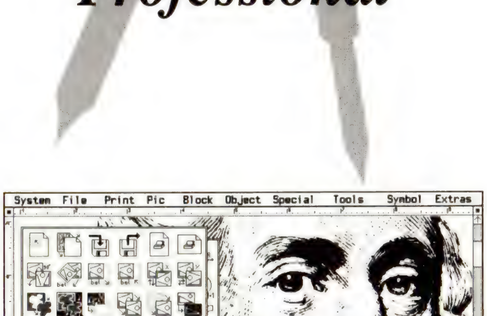
If Van Gogh were alive today...

MEGA PAINT *Professional*



...he'd probably be creating his latest masterpieces with MegaPaint Professional, the brand new graphics powerhouse from CodeHead Software!

MegaPaint Professional is an amazingly full-featured combination bit-map and vector graphics tool for Atari ST and TT computers. That's right, both types of graphics in one program! Here's a partial list of its features (and this list barely scratches the surface):

★ Virtually any drawing function imaginable is available, making a complete listing impractical here. Besides the normal tools, there are such obscure features as rhomboid, equilateral polygons with 3 to 32 sides, circular or elliptical ringsectors, dropping perpendicular lines, or parallel lines...all available in either bit-map or vector graphics.

★ Extensive text support, including bit-mapped and vector fonts, as well as support for the vast Signum font library. You can easily create your own fonts or symbol tables from any graphics block.

★ Vector graphics can be projected into a bit-map picture and bit-map graphics can be faded into a vector picture, giving you unique flexibility when working with any type of graphics.

★ Whether working with bit-map graphics, vector graphics, or text, the user interface and features are tuned to give you the power and ease of use you expect from a CodeHead product.

★ Coordinate systems and even screen aspect ratios can be adjusted.

★ FAST block and lasso functions.

★ Editable fill patterns and line styles.

★ Up to four planes of color separation may be manipulated, overlayed, viewed with varied intensities, and printed to a color printer.

★ There are 197 dropdown menu selections and 377 submenu dropdown selections! Unique overlapping pop-up menus give you 120 selectable icons.

★ MegaPaint can be used with virtually all printers. Supplied printer drivers can be easily edited to adapt to any printer.

★ Pictures can be loaded in MegaPaint's .BLD format, standard .IMG format, MS-DOS .PCX format, Degas, straight 32K format, or STAD format (.PAC). Vector graphics can be exported in CVG format.

★ MegaPaint can call external modules, allowing infinite expandability for new functions. Import modules are already in the works for several other picture formats.

★ Runs on any ST/TT with a monochrome monitor from 640x400 up to 8192x8192.

★ Virtual page size may be as large as 7680x7680. Pictures may be loaded into any area of the virtual page.

★ MegaPaint has network support.

★ Scanner support currently includes interfaces for 3 different scanners. External module support allows the future interfacing of any other scanner.

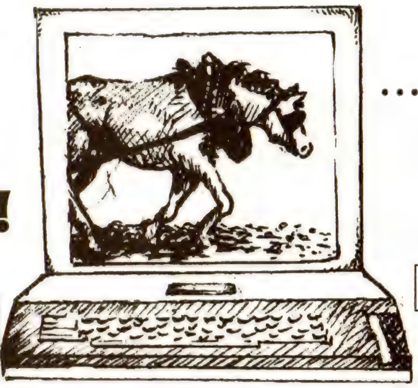
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

THE FLOPPY BOARD $109/149

The Floppy Board has arrived! This long-awaited Black Box add-on has been in the making for quite a while, but we've packed it with features that are worth the wait! This sophisticated device allows connection of up to four 5.25" or 3.5" floppy drives (drive sizes may be mixed). Access to these drives will be at parallel bus speed, approaching that of hard disks!

The board consists of 13 special integrated circuit chips, fully powered by the power supply of the Black Box. It has its own on-board microprocessor to take the load off the computer's processor for disk I/O. The board and fits perfectly over the Black Box (inside the custom cases!). It is not a stand-alone device; it must be used in conjunction with the Black Box.

High density disks are supported, so 1.2 meg 5.25" and 1.44 meg 3.5" drives may be connected. This is the only 8-bit controller to fully support these drives and densities! With four 3.5" 1.44 meg drives connected, you can achieve more total storage than a 5 meg hard disk! Archiver compatibility is supported! This means you can back up those titles no longer available. Although it's not as powerful as our Super Archiver, it will have the same editing power, with good backup capability.

Software included with the Floppy Board includes a utility to READ and WRITE IBM and ST disk formats! This will yield the easiest possible way to port text and data files between your 8-bit and ST or PC! This will be compatible with most all of the current formats. Also included is a high-speed sector copier designed to make extremely fast, verified copies of disks. A future upgrade to the Hard Drive Pro Backup (our hard disk backup tool) will make special use of the floppy board, and squeeze even more data on each disk than standard formats allow. It is possible to actually store 1.6 megs of data on a 1.44 meg 3.5" drive, so backing up a full 20 meg hard disks might only take 14 disks! Usage of the Floppy Board's on-board processor will allow overlapping reading and writing, making the backup really fly.

Two versions are available: the basic unit, and the Deluxe version. The basic unit provides the interface necessary for low density drives (360k for 5.25" and 720K for 3.5"), and comes with the IBM/ST transfer utility. The Deluxe version adds the high density capability, adds Archiver compatibility, AND adds the features of the Black Box Enhancer, which include a high-resolution 16 grey scale printer screen dump, and a powerful built-in sector editor, disassembler, and copier (which accesses the full 16 megs possible of hard disk partitions, and uses all available extra memory). Note: the Floppy Board replaces the ROM on the Black Box, so current Black Box Enhancers cannot be used with the Floppy Board.

The basic unit is only $109.95, and the deluxe unit is only $149.95. Add $5 for shipping/handling.

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

***>> Fall special** price - $59.95! <<*

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Managing Editor — Patricia Snyder-Rayl
Editor — Bill Rayl
Contributing Editors
Jay Craswell, Dave Plotkin

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

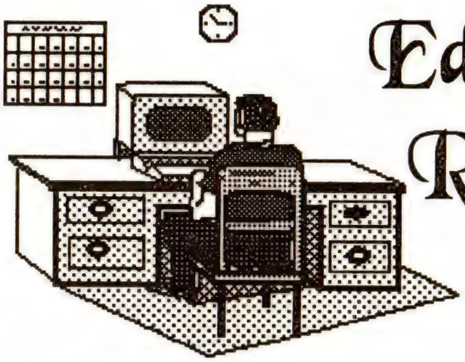
Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari Mega/STe 4, HP Laserjet II with PacificPage Postscript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.
Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.



Editorial Ramblings

Lately, we've gotten a bit of feedback about the size of the club section. Most of the comments have been that it's too big. If you compare January's club listing, at an all time high of 11 pages, to this issue's list, at just over two pages, you can see that the layout is flexible! The only different between the two lists is the amount of information and that this time we didn't use the club logos.

We sent out a letter to all of our 80+ clubs in December asking for comments. So far, the response has been to make the list more of a directory—and that's what we tried this month. We'd like to hear from you!

Speaking of opinions, we should have a final tally of the survey we printed several months ago. We think you'll find the results as interesting as we do!

Finally, we're compiling a list of what back issues of the magazine we have lying around. If you'd like a copy of the list, just send us a self-addressed, stamped envelope (SASE). Back issues are $2 each, which included shipping. Also, back issues of the Disks of the Month are available all the time! If you'd like a catalog, just send us a SASE and indicate if you want the ST, 8-bit or Mac disk list.

Bill & Pattie Rayl

CompuServe puts the whole world at your fingertips.

When you connect your computer to CompuServe, you join the world's largest international network of people with personal computers. You have access to more than a thousand services that offer a source of support, information, entertainment, communications, and benefits of all kinds.

A world of advantages.

CompuServe lets you take advantage of your personal computer in a thousand different ways.

For instance: communication. You'll get invaluable personal computer software and hardware support from other CompuServe members, as well as product manufacturers, all over the world. Meet in special interest forums to discuss everything from science fiction to sharing software. And keep in touch through electronic mail and faxes, as well as by "talking" over 72 CB Simulator channels.

CompuServe also lets you shop coast-to-coast at hundreds of nationally known stores and take advantage of a world-class reference database. It gives you access to the latest national and international news. And our special financial files offer complete statistics on over 10,000 NYSE, AMEX, and OTC securities. You can even trade online with local discount brokers.

Global travel and world-class fun.

CompuServe also offers airline schedules, so you can check out the bargains and book your own flights on almost any airline worldwide. You can get travel news, frequent flier information, and country and travel facts. As well as listings from over 30,000 hotels.

Plus, there are games. Sports, trivia, educational, space fantasy… you can go it alone or compete against players from all over the world. Only on CompuServe can you test your wits in the only online TV-style game show with real prizes, or leave the earth entirely in one of our interactive space adventures.

Just give us a call.

To become a CompuServe member, you need a computer and a modem. We'll send you everything else, including a $25.00 usage credit with your Membership Kit. In most places, you'll be able to go online with a local phone call.

To buy a CompuServe Membership Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call us today.

And put the whole world at *your* fingertips.

ATARI BULLETIN BOARD

Atari Developers

CodeHead Software, US distributor of TommySoftware's MegaPaint Professional, has recently announced they've added support for several popular scanners.

This is done through a MegaPaint external module and a desk accessory called ScanLite from Wiz Works and Dr. Bobware. ScanLite/MegaPaint Professional supports Migraph, Geniscan, Golden Image and Daatascan scanners!

Charles F. Johnson claims that MegaPaint Professional has been benchmarked at speeds almost 200 times faster than Migraph's Touch-Up for such things as rotating blocks or importing graphic files.

MegaPaint Professional retails for $175, and is available from CodeHead Software PO Box 74090, Los Angeles, CA 90004, phone (213) 386-5735.

ScanLite is available from Dr. Bobware, 180 N. Hazeltine Ave, Campbell, OH 44405-1024, (216) 743-4712, and retails for $20.

Quick Changes

Also, as of January 1, 1992, CodeHead Software will be taking over worldwide development and distribution of Quick ST! Darek Mihocka, the creator of Quick ST, is selling the popular software accelerator in order to spend more time developing a PC-based Atari ST emulator.

According to Darek, "The response to my emulator demo at the Chicago Atarifest was very positive. In order to bring the emulator to market in a timely fashion, it became clear that I couldn't do that while at the same time trying to develop new versions of Quick ST. Both products would ultimately suffer. In the capable hands of CodeHead Software, Quick ST will continue to exist and be improved upon, and ST and TT users can look forward to a long life for the product that speeds up their machines. It's a win-win situation for everyone."

Charles F. Johnson added, "We're quite excited about Quick ST and are looking forward to supporting this excellent product; and since we've purchased the source code, you can also look forward to further development of the program."

Quick ST is the only US-made screen accelerator still being actively supported. CodeHead will also be handling updates from older versions of Quick ST. You can upgrade to the latest version by returning your original Quick ST 2.x master disk to CodeHead Software along with a check or money order for $20.

Owners of SofTrek's Turbo ST (any version) may also upgrade to Quick ST 3 by sending in your Turbo ST master disk and $20. The retail price of Quick ST 3 is $34.95.

NewDesk for Everyone!

CodeHead Software also announced the TEC—the TOS Extension Card. Developed by Germany's Artifex, this circuit board allows you to use the very latest version of TOS (2.06) in your existing 520ST, 1040ST or Mega ST!

Now, you can have the same new system software that owners of Mega/STEs and TT030s have been enjoying! The price for this upgrade, including the board, is only a little more than the cost of upgrading to TOS 1.4! The TEC is a tiny card that will fit in *any* model of ST computer, regardless of design.

The CodeHeads say it is compatible with existing upgrades, such as monitor interface boards or processor cache cards. The price includes the ROMs containing TOS 2.06.

TEC Specifics

Unfortunately, because TOS 2.06 has a different address and requires more space in the ROMs, you can't simply pull out your old ROMs and plug in the new ones in pre-STE machines. Therefore, you need the TEC board. Its size is a mere 2.5" x 2.5", and its unique design allows it to be placed almost anywhere inside the case of the computer. Some soldering is required to install the base model of the TEC.

There are, however, two configurations of the TEC that are plug-in solutions, requiring no soldering. These are the TECbridge BUS card, which plugs into the processor bus of the Mega ST and the TECbridge CPU, for computers that have socketed 68000 chips. This last option plugs into the CPU socket and requires room above the CPU inside the case.

The retail price of the TOS Extension Card is $139, and that includes everything you need, including a manual describing the installation of the TEC and the new features of TOS 2.06.

The TECbridge BUS and TECbridge CPU options are priced at $155. The TEC is scheduled to begin shipping on January 10, 1992.

Goldleaf News

Goldleaf Publishing has signed an exclusive agreement with COMPO Software to distribute products in North America. COMPO Software is based in Germany and sells the word processors That's Write and Write On.

That's Write features "what you see is what you get" display and special format proportionally-spaced fonts. Goldleaf states that both internal printer fonts and downloadable fonts can be used in the same document, several files can be edited at the same time, and IMG pictures can be added to spice up your correspondence. That's Write also allows mail merge for easy form letters and has an automatic Index and Table of Contents feature plus a spell checker.

Write On isn't as full-featured as That's Write, but Goldleaf provides an upgrade path to That's Write for those who later find they need its more specialized features. Write On files are compatible with That's Write.

That's Write is available for $199.95; Write On is available for $99.95. Goldleaf Publishing, Inc., 700 Larkspur Landing Circle, Suite 199, Larkspur, CA 94939, (415) 257-3515.

Coming soon from the Goldleaf/COMPO duo are C-Font and CompoScript. C-Font converts Calamus fonts to That's Write, Write On, GDOS and other formats. CompoScript is a PostScript interpreter that supports Adobe Type 1 fonts.

Here on the Home Front

Lexicor Software announced to waiting customers that Rosetta is now shipping. People who purchased their 3D/Translator program directly from Lexicor will receive the program first. Customers who have back orders through Rio Computers will be next in line.

Rosetta allows for import/export of ST, Amiga, PC and Mac 3D files, such as AutoCad, Renderman and Amiga and Mac Sculpt-3D. You can also import pictures and animations. For more information, contact Lee Seilor at Lexicor Software, (415) 453-0271.

Need a Parachute?

Double Click's Michael Vederman and Rimik Enterprises' Rich Betson, two long-time Atari developers, have formed a new company called Eye See, Inc. Eye See is intended to be a channel into the IBM PC marketplace for developers of Atari products. The two Atarians have located venture capital for full-scale marketing and world-wide representation of PC-converted ST software. The hope is to allow ST developers to remain in the market they enjoy by getting the PC market to fund them. Contact Eye See, Inc. at (619) 630-1217.

Fun with Word Skills

Fair Dinkum is shipping Crossword Creator II, a utility allowing users to quickly and easily create crossword puzzles on any ST, STE or TT (in ST medium or high res mode). You can create large puzzles up to 30x20 in size with up to 100 words. Puzzles and solutions may be saved in Degas PI2 or PI3 format and the clues can be saved as ASCII text files for easy incorporation into desktop publishing software.

Puzzles and solutions may be output to any printer that supports screen dumps, but a final-quality print mode for Epson compatible printers is included. There are a wide range of features and options including manual or automatic word placement as well as a 12-page, illustrated manual.

Also from Fair Dinkum is Word Search Creator, a word search puzzle creating package. WSC allows the user to easily create puzzles interactively from the keyboard or via a *fast* word list method. Puzzles may be up to 24x13 in size with up to 100 words.

Puzzle Pack is a specially-priced ($34.95) bundle of both Crossword Creator II and Word Search Creator. Crossword Creator II retails for $24.95 and Word Search Creator sells for $19.95. For more information, contact Fair Dinkum's John Hutchinson, PO Box 2, Los Alamos, NM 87544, (505) 662-7236.

Boot with Gribnif

Gribnif Software has announced their new GEM "boot manager," XBoot. This program runs as the first thing in your ST's AUTO older, so you have independent control over the tons of desk accessories, configuration and AUTO folder files. XBoot also lets you configure special setups that allow you to customize the system for different applications—all at the click of a button.

XBoot has a list price of $39.95, but a special introductory price of $29.95 is available through orders placed directly with Gribnif Software. Shipments are schedule to begin the first of January. To place an order, or for more information, please contact Gribnif Software at P.O. Box 350, Hadley, MA 01035, (413) 584-7887.

Right on Target

David Plotkin
Contributing Editor

By the time you read this, 1992 will be well underway. Let's hope it will be a prosperous year for Atari owners and Atari Corporation.

I am heartened by the arrival of a type of software that has existed on other computers for a number of years, but is new to the Atari. On the Macintosh, this type of software is credited with causing a large jump in the number of people who went out and bought Macs. Kinda makes you think, doesn't it?

What's All This Hype?

The new type of software I'm referring to is based on an old concept: hypertext. In its original form, hypertext was a special kind of text. It looked just like regular text, but when you selected the text, you could get more information about the selected word or phrase. The explanation might also have some hypertext in it—with the result being that you could jump around, exploring information to whatever depth you needed, in whatever order you chose.

Of course, hypertext really can only exist on a computer. A logical extension to the concept of hypertext (for a computer with a mouse and menuing system) is "Hypermedia."

Essentially, Hypermedia combines the use of multiple mediums (text, graphics, sound, etc.) into a single application. The user of such an application can select anything that looks interesting on one screen, and that item will link to further information or related items on another screen. In other words, jumps can be made not only by clicking on text, but also on buttons or other graphic elements.

Pick a Card, Any Card

Bill Atkinson, one of the original designers of the Macintosh, provided a product based on hypertext and its extensions. He called it Hypercard. It was structured much like a database, with each record being a "card." To jump to another card, you could click on text, buttons or just pictures on the card, and information could be entered in fields on each card if you wanted to.

Bill gave Hypercard away free with every Mac that was sold. This was an absolutely brilliant marketing scheme on Apple's part, because it provided the new Mac owner with a fun and useful application.

It also provided a way for any Mac owner to write a program for the Mac. The Mac, much like the ST, is not an easy machine to program, due to the menus and windows, etc. With Hypercard, however, you *could* write your own programs for the Mac, complete with all the things that made Mac programs so "sexy." You could do quite a lot with Hypercard even if you didn't know any programming.

If you could master the simple Hypertalk programming language, then the possibilities seemed endless—literally thousands of "stacks" (as Hypercard programs were called) were written to do all sorts of interesting things. Maps, golf games, address books, spreadsheets—you name it, there is a Hypercard stack for it.

It wasn't long before a variety of "Hypercard wannabes" starting showing up on the PC, but the PC is not a machine that is well suited to the graphic elements of the "Hyper" environment, at least not until the advent of fast 80386 chips and Windows 3.0.

Hype for the ST

As of this writing, there are at least two Hypercard-type applications available for the ST, and this bodes well for our favorite computer. They are both somewhat rough in their current (late 1991) version, but the fact that they exist at all is good—and their programmers are hard at work making them better and better.

HyperLINK

Probably the most full-featured product is JMG Software's HyperLINK. It is fairly complex to set up a new application and there are some places where it needs to be improved. A good example is the fact that you can add a field to a HyperLINK card, but the application won't create that field in the underlying database.

It desperately needs a manual update. It also needs its own version of a programming language to round it out. But these are all things that are being addressed, so I have high hopes for it. A number of applications have been written in HyperLINK, and the floodgates will likely open as the product matures.

1st Card

Another product is 1st Card (notice how "hyper" or "card" gets into every title?), a German import that purports to be Hypertext and artificial intelligence (it isn't really). What it *does* do is permit you to build an application that traverses a decision tree, creating a simple "expert system." An expert system is a computer program that has a body of facts built into its structure, so that it can make decisions based on the answers to questions—much as a human expert would. The hard part, of course, is defining all the rules (the questions and what the answers mean).

Unfortunately, the advance copy I had of 1st Card wouldn't run on my Mega. Oh well. Maybe the next one.

If Hypercard-like products reach maturity and truly enable ST owners to produce high-powered applications as easily as Mac owners do with Hypercard, then Atari would do well to consider bundling such a product with the ST. Instant usefulness and the ability to create your own program is an almost irresistible calling (hyper)card.

And wouldn't we just hate to have Atari sell a whole lot more STs in 1992.

See you next month.

***STalker 3* is the best, most complete, easy to use, telecommunications software for your Atari!**

Features Include:

- Runs in a GEM window as a GEM program or desk accessory with full background operation!
- VT52, VT100, PC-ANSI terminal emulation
- ASCII, XModem, XModem 1K, YModem, YModem/G, and ZModem file transfers
- Virtual screen size (from 40x24 to 200x2000)
- GDOS support for different terminal fonts
- Powerful Autodialer with up to 30 numbers
- 20 user-definable function keys
- Cut and Paste text clipboard
- Support for the *NeoDesk*® *3* desktop
- Fully integrated with the optional *STeno*™ text editor
- Advanced *BackTALK*™ scripting language
- 200+ page manual, including full tutorials
- All of this and more for only **$49.95!!** (suggested retail)

Bill Rayl

Telecommunications is one of the primary uses of a personal computer. A computer and modem can take you to far away places where you can share ideas with a large community of people.

My first real interaction with computers was through telecommunications. In fact, I probably wouldn't have gotten hooked on computers had it not been for a DEC-10 mainframe, an Atari 800XL and a multi-user conferencing program called Party. The first time I "talked" with my wife, Pattie, was via Party.

Being a telecommunications junkie, I'm always looking for "the perfect telecommunications package." Of course, there really is no such thing (unless you write the program yourself!). What's perfect for one person may not be so perfect for another.

For a very long time, the most popular telecommunications program on the Atari ST line of computers has been Flash from Antic Software. Flash was also my personal choice. Its ease of use and adequate DO (script) file capabilities made it very attractive to both new and experienced users.

A number of other programs have come and gone since Flash was released, a few of them good and many of them very bad. None of them, however, could equal Flash's ease of use combined with power and flexibility...until STalker was released by Strata Software.

Now, STalker is at version 3.0 and is sold by Gribnif Software, unquestionably one the brightest stars in the ST developer's community. STalker 3.0 has a totally different approach to telecommunications than any other package I've ever used.

STalker is completely window-based. You can resize the "screen" at any time. There is no switching between online mode and editor mode. In fact, there is no editor built into STalker at all—if you want full editing and capture capabilities, you can use STeno (also from Gribnif Software) or Clear Thinking's EdHak (as of version 2.3). While you can do simple capturing of text to disk via STalker alone, I highly recommend that you purchase one (or both!) of these editors for use with STalker.

One of STalker's most important features is that it can be installed as a program or as a desk accessory, and you can even install multiple STalker DAs. As a desk accessory (or as programs run via MultiGEM), STalker can perform *all* of its functions "in the background." These functions include uploading/downloading of files, capturing text or messages or even running a mini-BBS (using STalker's excellent scripting capabilities).

In other words, STalker can be logged in on your favorite BBS and downloading a huge file *while* you're typing the Great American Novel with your word processor. If you're fortunate enough to have a Mega/STE, TT, DC Port (from Double Click Software), MegaTalk (from Gadgets by Small) or Beckemeyer's MT C-Shell, you can even be two (or more) places at one time! Well, you do need multiple modems, as well.

Magic? No, but it sure feels like it!

Minus the MegaTalk, I happen to own all of the above equipment. The first time I used STalker and my DC Port to log onto CompuServe, GEnie and a local BBS all at the same time, I was impressed. In one window, I was reading messages on CompuServe. My GEnie mail was being captured to STeno in another window. And, I was downloading a huge file from the BBS in the background.

All this without a glitch and with no real slowdown of my 4 meg STE. In fact, the only real drawback was that my poor little monochrome monitor was feeling really cramped. This multi-tasking stuff could sure sell a lot of "big screen" monitors!

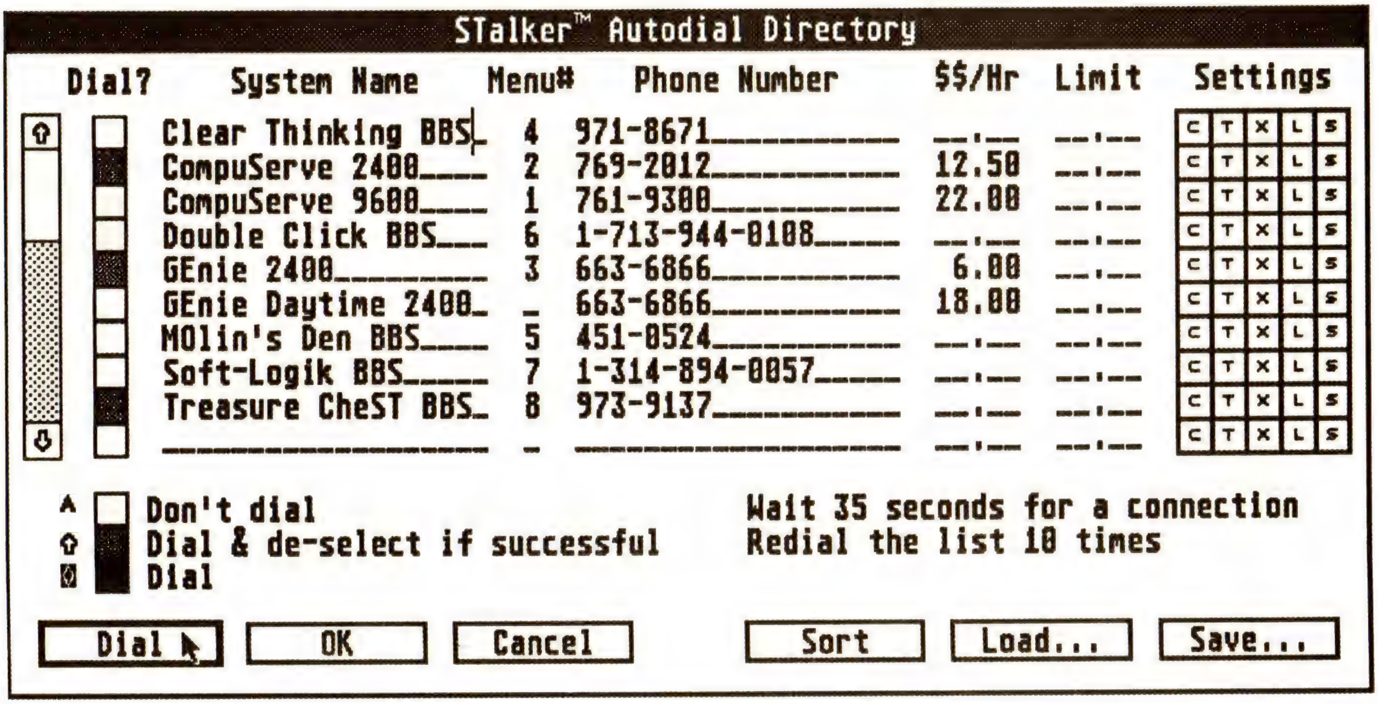
Ease of Use

I have three main criteria by which I judge any telecommunications package. The first is ease of use, the second is power/flexibility and the third is actual performance. Ease of use includes everything from setup of the system to the program interface.

In this first category, STalker rates an A. Installation is as simple as copying the program disk to your hard drive or work disk (and rebooting if using STalker as a desk accessory). Even using multiple copies of STalker is as easy as making multiple copies with different names.

Configuring STalker is also very intuitive. All configuration options are found under one drop down menu, called Settings. Here, you define your communication settings, file transfer preferences, terminal emulation, communication port, function keys and lots more. When using STalker as a desk accessory, you must reboot to use your new configuration.

Each of the dialog boxes used in the configuration are covered in detail in the manual. Overall, the manual does an excellent job of documenting all of STalker's features. The first half of the manual consists of 78 pages of STalker documentation, a four page Table of Contents and a one page Index. The Index could stand for some expansion. For instance, if you want to know how to define Function Keys, you won't find an entry in the Index that will help you.



STalker™ Autodial Directory

Power/Flexibility

The second half of the manual documents STalker's scripting capabilities using BackTALK. These 130 detailed pages include many useful examples and a tutorial. The Index in this section is also much better, with entries for every function call, operator and reserved word.

It is the BackTALK scripting language that gives STalker an A in the Power/Flexibility category. The language is very C-like and very powerful. BackTALK has enough power that you could even use STalker as a BBS. In fact, a BBS written in BackTALK is included on the STalker disk!

I personally run a Michtron's BBS 3.0 multi-line system—that's why I have a DC Port. Michtron's BBS is completely written in a compiled scripting language called Michtron Command Language. It would be a very simple operation for me to translate my MCL source files to BackTALK. And, since the BackTALK scripts are also compiled before use, they execute much more quickly than scripts in some other telecommunications packages.

BackTALK is actually more powerful than MCL in almost every respect. BackTALK has one-dimensional arrays, it uses long integers, supports parameter passing between functions and allows for local or global variables. The only things stopping me are BackTALK script can't (at this time) execute another BackTALK script and true "libraries" are not supported.

Once you've written a script (using STeno, or whatever editor you favor), you then compile it using the BackTALK compiler. The compiler can be run as a program or desk accessory. It is also very easy to use—simply select the text script file and, if you haven't made any programming errors, your compiled script is generated.

Using the BackTALK scripts is a painless process. You can actually install up to 10 scripts in the BackTALK drop down menu. These installed scripts can be activated by clicking on the menu entry or via a key combination. Alternately, you can run BackTALK scripts from disk on an individual basis.

Features

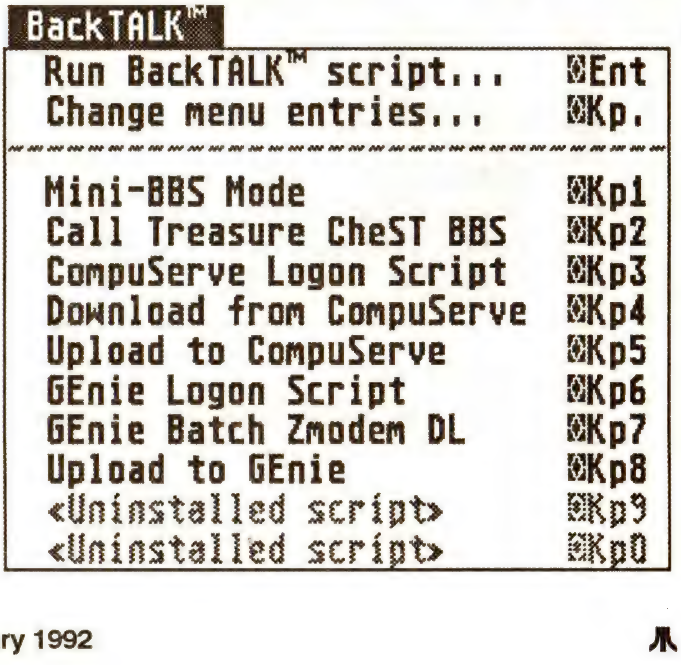
I don't want to give the incorrect impression that STalker itself lacks power. It has plenty! Two very powerful features mentioned previously are the ability to run in the background and to use just about any port for communication. STalker supports the extra Mega/STE and TT serial ports, MIDI and printer ports, as well as the MegaTalk and DC Port hardware and MT C-shell software serial ports.

STalker also has a "Mini-BBS" mode built into the software (it actually uses the previously mentioned BackTALK script). Callers must know the "Sign On Password" to access the system and a "CLI Password" to access files on your system.

Terminal emulation in stalker includes VT52, VT-100 and PC-ANSI modes. You also have an option to use the IBM character set. If you call IBM BBSes that use ANSI graphics screens, you'll appreciate this feature.

File transfer protocols include ASCII, XModem CRC, XModem 1K, YModem Batch, YModem/G (for error correcting modems), and ZModem. STalker can also "auto-initiate" ZModem transfers, a handy feature that saves you that one extra step. The only thing I'd like to see added is direct support for CompuServe's B+ protocol. For now, though, you can use Shadow for CIS B+ transfers. (Shadow is a background downloading program written by Double Click Software and marketed, until recently, by Antic. It is not included in the STalker 3 package.)

The dial directory can contain up to 30 entries, each with their own communication settings, logon sequences and script files. A $$/Hr field helps you keep a



BackTALK™

<Uninstalled script> ⌘Kp0

rough estimate of how much you're spending when connected to a pay service like GEnie or CompuServe. If you enter a dollar amount into the Limit field, STalker will warn you when you exceed that dollar limit.

The dial directory is also an autodialer. You can set individual entries for autodialing. Then, clicking on the Dial button causes STalker to dial the selected entries one by one.

Another nice touch is the ability to have up to ten of your most used dialer entries appear in the Dial drop down menu. You simply include a number 0-9 in the Menu# field in the dial directory.

STalker also supports GDOS font usage, although this does slow the system down. GDOS is included with the package, along with four font files.

You can also set a "virtual screen size" anywhere from 40 characters by 24 lines to 200x2000! A "scroll back buffer" allows you to review text that has scrolled off your actual screen.

Finally, you can define up to 20 Function Keys. You can use these Function Keys to execute BackTALK scripts or send text strings to the host system. If you wish to output more than 40 characters, you can "chain" one Function Key to another.

Performance

In the final category of Performance, STalker maintains its perfect score. In over two months of heavy usage on CompuServe, GEnie and a local BBS, STalker has performed flawlessly.

Even with multiple STalker desk accessories installed, and logged on to multiple systems simultaneously, I've had no problems and no aborted downloads. When combined with STeno 2.0 or EdHak 2.3, STalker is the best all-around telecommunications package currently available for the ST/STE/TT computer.

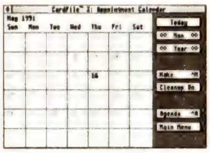
CardFile™ 3

Personal Information Manager

CardFile™ 3 is the complete personal information manager for your Atari ST.

With CardFile you can create easy to use Rolodex® style address books and phone lists.

A powerful and intuitive *Filter* function lets you instantly find any name, address, or phone number. Or it can even find a group of cards that match any particular information you want.



Its powerful built-in calendar can keep track of all your appointments, meetings, and important dates. Call up any day and plan out your agenda.

CardFile's Daily Agenda feature will remind you of any upcoming appointments for the next two days when you turn the computer on in the morning. There's even an option to print a daily or weekly agenda.

CardFile is very convenient. It runs as either a desk accessory or program. Its data is easily imported by most programs and it will even type an address directly into your word processor.

It will print address books, phone lists, and mailing labels. Add a modem and it becomes an autodialer!

STeno 2

Bill Rayl

STeno is a window-based text editor specially designed to interface with the STalker terminal package.

As a stand-alone editor, STeno is neither the best or the worst available. Its good points are that it can be used as a program or desk accessory, it's very easy to use and has some printer control support built in. It also has block cut/paste and copy support, as well as search and replace.

On the "negative" side, STeno does not automatically reformat your text. If, for instance, you place the cursor in the middle of a line of text and begin typing, the text at the end of the current line does not automatically wrap down as you type. You must reformat the text after editing, using the Reformat Paragraph or Reformat to End commands.

Also, STeno is a text editor. It can only edit standard ASCII text. If you want to edit anything, including text, EdHak from Clear Thinking is your best choice. EdHak is also a GEM-based editor that can be used as a program or desk accessory.

If you're into speed, Tempus II is far faster. If you're a programmer, Tempus II or Michtron's C-Breeze would be a better choice. Tempus and C-Breeze are specially designed for programmers. They let you open multiple files simultaneously and have all the features of STeno and more.

Why Buy STeno?

So, why should you buy STeno? Well, there are a couple very good reasons if you use NeoDesk or STalker. STeno adds a versatile capture buffer to STalker, which lacks this feature. When used with STalker, STeno can also function as a type-ahead buffer. This gives you full editing capability over all text you send to or receive from the host computer, and is great for conferencing.

Until recently, STeno was the only choice available for interfacing with STalker. EdHak 2.3 now has STalker support, as well. If you're planning to use STalker, you really *need* to have one of these two editors. Since both editors have a retail price of $29.95, you'll have to choose based on features.

If you're a NeoDesk user, STeno can be installed as a NeoDesk Accessory. You can then place the STENO.ACC icon on the desktop and double click it to access STeno.

If so installed, you can automatically load a text file by dragging it to the STeno icon, print the file by dragging the printer icon to the STeno icon or delete the file by dragging the trashcan to the STeno icon. You can also assign a desktop icon letter to STeno and open the accessory via a key command.

Conclusion

If you're looking for an easy to use text-only editor, STeno compares favorably with other commercial text editors. For use as a STalker capture/type-ahead buffer, both STeno 2 and EdHak 2.3 are excellent choices. If you're a NeoDesk user, STeno is your best choice, especially if you also use STalker!
